#### American Tin Plate List.

With the object of furnishing to the tin plate trade and to consumers of tin and terne plates generally the latest information in regard to the products of the domestic manufacturers, we print in this issue a comprehensive list of American tin plate makers and the names of their brands of tin and terne plates, together with an alphabetical list of the latter. The list may be claimed to be as accurate and complete as it is possible to obtain, being based on returns received direct from the makers within the last two weeks. Only such brands are included as are at present actually on the market. The tables will, therefore, be found very valuable for reference. Brands of domestic tin and terne plates have increased and multiplied so luxuriantly during the past two years that it has become an utter impossibility for any one to maintain an acquaintance with the mass of new names without such a guide as the list we now present. Nothing of the kind has yet been printed, but that the want of such specific information is widely felt is proved by the numerous inquiries in regard to new brands addressed to The Metal Worker. The details given as to the number of tinning sets possessed and in operation, although not entirely complete in regard to the latter subject-a few manufacturers having declined to furnish this information-will be found useful as affording an approximate idea of the capacity of the various works. The increasing number of concerns rolling their own black sheets will be noted as an encouraging feature of the domestic tin plate situation.

#### Carbonic Acid Gas.

Notwithstanding all that has been said and written regarding carbonic acid gas and its presence in our atmosphere, there still exists in the minds of many who ought to be better informed

a somewhat hazvidea of its character istics and its relation to human comfort. The ventilating engineer is continually meeting with those who still have absolute confidence in the long since exploded belief that this gas, immediately upon expiration, settled to the floor, because of its greater density. and there remained as a ponderable mass. Of course the accompanying idea that this gas must therefore be removed at the level of the floor is presented to him to combat. It is true that carbonic acid gas has a density or specific gravity about 50 per cent, greater than air and that it can be poured like a liquid from one receptacle to another, but it is likewise true that once thoroughly mixed with air the mixture becomes permanent and no length of time will show any tendency on the part of the carbonic acid to settle out. Nevertheless the two gases can be placed one above the other in a bottle and will remain separate if not agitated. To a more marked degree the conditions are the same in the case of the wells that were formerly used on the island of Bermuda, where, owing to the porosity of the soil, fresh water wells with supply from below are unknown. Instead, however, the wells at low levels partially fill with the salt water that percolates through the coral formation while the surface water is conducted to them from above. This fresh water will remain for days upon the surface of, and practically separate from, the salt water beneath. But once agitated the mixture is complete and no amount of standing will cause it to return to the original conditions of separate lavers.

#### Diffusion in Air.

The carbonic acid gas formed in the process of respiration becomes of necessity intimately mixed with air in the expired breath, while from the skin there is also a constant discharge of this gas, only about one-fifth as great, but well distributed over the body. In still air of moderate temperature the exhaled products of respiration being at a temperature of about 90° will naturally tend to rise and even more rapidly to diffuse in the surrounding atmosphere. In fact, the carbonic acid gas that is breathed out is almost instantaneously absorbed by and inseparably mixed with the air of the room. Therefore provision for ventilation should be regulated not by the relative densities of air and this gas, but rather by the natural direction of the air currents in the apartment under all conditions, avoiding any possibility of drafts. Certainly with the ready dispersion of this gas in a room of moderate size, and its consequent equal distribution throughout the apartment, it can make but little difference from this standpoint just where the ventiliting opening is placed. It is desirable, however, to always permit the air supplied to make as complete a sweep of the room as is possible before it is permitted to escape.

#### Ventilation.

Ventilation, therefore, becomes not so much the actual removal of foul. and vitiated air, as some would have us believe, as the supply of fresh air in such quantity as to properly dilute that within the room. If it were not necessarily a continuous process, we might look to some scheme of absorption or of chemical union with the gas in the air, thereby rendering it sufficiently pure, just as one might attempt to reduce the salinity of the agitated waters of a Bermuda well instead of mixing therewith the necessary amount of fresh water to reduce it below an objectionable degree of saltness. In fact, this principle of dilution holds so fully that we may even calculate with considerable accuracy the percentage of carbonic acid gas present in a given apartment, if we know the number of occupants, the time of their occupation and the volume of air continuously admitted. Or we may, on the other hand, calculate the volume of air actually admitted if we are informed as to the other factors of occupants, time of occupancy and percentage of carbonic acid present. A more complete realization of the condition existing, even as brifly stated here, cannot fail to result in improved methods of ventilation and to lessen the cause for discussion between heating and ventilating engineers, architect and client.

The Bureau of the American Republies announces that the new port of Barrios on the Atlantic coast of Guatemala has been declared open for traffic. Barrios is the northern terminus of a railroad, one third of which is finished, which is designed to stretch across the isthmus to the port of San Jose on the Pacific coast. When the line is completed the time of transit from ocean to ocean by this route will be ten hours.

The official report, just issued, on the foreign trade of Germany in the year 1893 shows a decline in imports of \$23,-250,000, as compared with those of 1892; the most important decreases being in wheat, wool and cattle. Exports, on the other hand, increased during the year by \$23,500,000, leaving a balance of about \$250,000 in favor of Germany. Iron and iron goods are among the articles which show the greatest gain, the increase over 1892 being about \$4,750,000 in value.

## Press Working of Sheet Metals.—VIII.

BY OBERLIN SMITH

Redrawing. Following the drawing process proper, as described in the last chapter, is the process of "deepening," "reducing" or "redrawing," by any of which terms it is frequently known. It depends in general upon the same principles, but offers somewhat in detail. The chief difference is that instead of drawing a comparatively shallow cup shaped arti-cle from a flat blank, it deepens the cups already made into other and deeper cups, at the same time reducing their diameter. In Fig. 271 is shown, in vertical axial section, a pair of dies for performing such operations. In Fig. 272 is a section of a cup shaped piece of work which, by the way, is often technically called a "cup" by the makers of cartridges and such like articles, its name after redrawing being a "shell." It has provided a "shell." It has previously been drawn from a blank, as described in Chapter VII, and is placed in a recess in the lower d.e. L., made to fit it, so as to guide it centrally into place. The upper die U is of such a diameter as to the rounded corners at rand r, Fig. 271, being made of such curvature as to fit each other. Successive stages of the work as thus redrawn are shown respectively in Figs. 273, 274 and 275. The rounded corner of the drawing punch r' obviously governs the corner of the finished work, as shown by the same letter. After the first redrawing the deepened cup or tube can obviously be again drawn, with another reduction of diameter, and then again, and so on ad infinitum, within certain practical limits. These limits are chiefly governed by the condition of the metal, which tends to harden in more or less degree, just as it does with other forging operations. With iron, steel, brass, copper, &c., annealing is necessary after each two or With such annealing, three draws. however, almost any increase of length can be obtained, as is shown in the case of an ordinary cartridge shell, pen holder tube, or similar article. A series of successive stages of such redrawing are shown in Figs 287 to 291, inclu sive. In the case of tin plate or other metal which cannot be annealed without spoiling the costing, not more than one or two redrawings can usually be made; and then the metal is apt to be so brittle near the edge, where most of the flow has taken place, as to render it unfit for other bending operations, such as curling, &c. By one redrawing it is practicable to obtain a tin plate cup or box of a depth about equal to its own diameter. Here, again, the proportions depend, of course, upon the quality of the metal and its thickness in relation to its diameter.

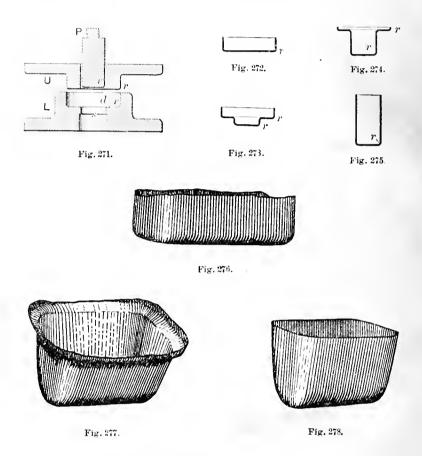

In Fig. 276 is shown a square steel box with rounded corners, as drawn in its first operation. In Fig. 277 is shown a second operation, as it was redrawn, and in Fig. 278 a third, making it into a complete elevator bucket. In this case the last operation was not, properly speaking, drawing, as the edge was trimmed and at the same time turned upward by being forced through a die, without reducing the diameter of the body, and, therefore, with no chance to use a blank holder. This is very difficult work to make—as the writer discovered some years ago when

developing various sizes of these buckets, as a new article of manufacture.

In Fig 279 is shown a pair of deepening dies, where the cup, Fig. 280, is placed over the lower die in an upside down position. It is therefore turned partially inside out in being brought to the form shown in Fig. 281. In Figs. 282 and 283 are shown subsequent deepenings which will explain themselves With plain shapes of this kind I have never been able to find out that there is any particular advantage in thus revers lng the work, although in some cases it is desirable for special reasons. One disadvantage, where the reduction in diameter is small, is that the lower diemust be thin, radially, and is therefore liable to burst should an extra thick sheet get in

An amusing circumstance connected with this last named process is that after

A modification of a deepening operation proper is shown in Fig. 292, where the broaching process is combined with the redrawing. The word "broaching" has here a very different meaning from that given it by the machinist, who applies it to the process of forcing a piece of metal through a lower cutting die, or pushing a punch through a hole, thereby shaving it down to a given size, and really performing an operation analogous to planing or slotting. In cases where he uses male or female broaching cutters, having a series of teeth following each other and each taking off its own chip, his work more nearly resembles milling. In relation to sheet metals the word means amashing the work thinner by forcing it through a space between punch and die which is too small for it. This in itself is, of course, very similar to some kinds of

PRESS WORKING OF SHEET METALS.

being in common use in various factories for a number of years, somebody patented it in this country. It is true we cannot expect the Patent Office officials to know everything that is happening in the world, but possibly an occasional tour, at the Government's expense, among such plants belonging to the great industries of the country as pertained to each visiting examiner's porticular kind of work, would be an excellent investment of the people's money.

In Figs. 284 to 286, inclusive, are shown the different stages of the work performed in a similar die to that last described, but with the difference that the cup, Fig. 284, was left with a flange upon it in its first operation. This flange could not, obviously, be very wide, there being nothing to prevent its wrinkling as it gradually crawla upward upon the lower die. The process la sometimea useful with thick metals and small diameters to produce auch work as Fig. 286 in the final operation.

tube drawing, which again is the same as wire drawing, if we imagine the mandrel to be a part of the tube. In the case in question a reduction of diameter is being made at the same time as the thinning of the metal is taking place. This is much practiced in car-tridge drawing, especially where it is desirable to keep the end or bottom of the work of the original thickness, as shown in the picture. When done, the bottom remains of as much greater thickness than the sides as happens to be required, and as has been arranged for in choosing the thickness of the sheet. In small work of this kind the use of a blank holder, or upper die, U, is abandoned after the first one or two draws, as the metal is reduced so little in diameter in proportion to its thickness that the wrinkles have no chance to form. Even if incipient wrinkles do form they are quickly crushed out again as the metal is aqueezed somewhat thinner.

In some large work, such as varlous

kinds of pans having considerable taper, a kind of upper die termed a vee blank holder is sometimes used in a redrawing operation. This blank a redrawing operation. This blank holder outside is of the same shape and size as the punch which drew the first operation, but is cylindrically hollow inside, for the punch of the second operation to pass through it. Thus the wrinkles are held from forming in a conical zone constituting the upper part of the body of the future completed pan, rather than in a flat flange, as is usually the case.

In Fig 293 is shown the first operation (seing ordinary drawn work) and in Fig. 294 the accord operation of what is known as a "rim cover," such as is used for pots and other utensils.

body at b, thus forming a pitcher-like untensil, as shown. This bulging out-ward might possibly be done with certain forms of expanding dies, but is usually performed by a spinning operation.

In regard to the kind of press best adapted for the deepening operations just treated of, it may be said that such a machine for many of the later opera tions is usually supplied with the single action ram, the chief characteristic being its unusually long atroke. Of course, where the stroke and power are sufficient any ordinary press will do, and no very great accuracy is required. In some cases such presses are made with an abnormally long stroke, arranged to adjust to any amount de-

THE ENCYCLOPEDIA OF FOUNDING.

DICTIONARY OF FOUNDRY TERMS USED IN THE PRACTICE OF MOLDING By Simpson Bolland. Size 71\(\frac{7}{2}\) x 5 inches; 535 pages. Published by John Wiley & Sons. Price \$3.

This work, in a great measure, sup-This work, in a great mount of plies a deficiency which has long exous terms used in foundry parlance are well defined and the different implements necessary to a well organized foundry are clearly explained. The metala most used in founding are treated fully with the possible exception of cast iron, which does not have the space devoted to it that its prominence warrants. The author appreciates the important part aluminum is to play in future founding operations, and has given much valu-sble information on the subject. The new applications and daily improvements in the manufacture of this metal render it impossible to keep its literature up to date. The value of chemistry to founding is set forth at length under the heading "Analysis." It would have greatly enhanced the value of the author's arguments had he seen fit when speaking of cast iron to give the proper analyses of irons which are suitable for various purposes, thereby giving foundrymen not versed in chemistry a basis on which to work. Such important subjects as sands, fuels and cupolas could have received more com-plete treatment and thereby add to the value of the book. Venting receives much attention and the information conveyed is valuable. While the references are very full, yet the ordinary reader would be greatly helped by a more complete treatment under one heading. The article on cupolas may be cited as an instance. The list of references is longer than the article itself. Under the title of "Technical Education for the Molder," the author seems to see the source from which the ranks of skilled mechanics are to be filled. It is an acknowledged fact that the number of skilled mechanics has been greatly reduced; but a well organized apprentice system, as suggested by Mr. Cribben in his paper read before the recent meetof the Stove Manufacturers' Association, would seem a much more fessiciation, would seem a much more feasible plan by which to increase the number of skilled workmen, thereby compelling the selection of foremen from their ranks. It is scarcely to be expected that any increase in the efficiency of the mechanic will prevent the "employment of an educated superintendent," as mentioned by the author as being necessary in some instances, but rather will compel the manufacturer to seek such services. Notwickstanding the criticisms it has seemed proper to the criticisms it has seemed proper to make, the book will be an acquisition to any scientific library and be of great assistance to all employed in founding operations.

Lightning struck the mill building occupied by J. F. Lewis & Bros.' lead works, Thompson and Huntington streets, Philadelphia, on June 30, causing \$6000 damage.

Brooklyn, N. Y., gas companies have reduced the price of gas to 90 cents per 1000 cubic feet.

PRESS WORKING OF SHEET METALS.

The bead or rim a has been bulged outward by the simple process of pushing the top down with a plain concave die, the lower edge of the metal being properly confined in a lower die. This is, of course, not a process of drawing at all, but is simply given here to illustrate an interesting operation following the work

of the drawing press.

Another useful after process applied to a deep drawn shell of comparatively thick metal of the shape of Fig. 295 is practiced by reducing the upper end and thus forming it into a metallic bottle, as in Fig. 296. This reduction is sometimes done entirely by spinning, but can also be done by a series of dies forced over the neck one after another, the body of the work being properly confined. Some cartridge shells are re duced in this way at the open end. In Fig. 297 is shown a somewhat similar reduction of the neck at a, together with the bulging out of a part of the sired, after the method of a planer table, the ram being driven through the medium of a rack, screw or other suita

ble mechanism.

The future possibilities of the interesting process of drawing and redrawing metals seem to me very great. Much has been done in comparatively recent times in the way of developing the various operations involved. We can, even now, manage articles as large as soda water fountains and kitchen boilers, drawing them cold, by the processes above described, from ordinary flat sheets To draw large steam boilers in the same way would be simply a matter of enormous first cost for the plant. Many irregular shaped articles are also now drawn, such as wheelbarrow bodies, sinks, mangers, &c. These processes simply need amplifying to produce bathtubs and boats. How large objects it will pay to attempt the way I will not worken to produce this way I will not venture to predict.

# MBING and GAS FITTING.

## Gas and Gas Fitting.—II.\*

BY J. W. HUGHES.

The Distillation or Manufacture of Coal Gas.

The principal processes employed in the manufacture of ordinary lighting gas, distilled from coal, are the heating of the coal in retorts for the purpose of driving out the gas, leaving in the retort what is known as coke; next the purification of the gas by passing it over and through certain substances, the principal of which is milk of lime. By these methods, known as washing, scrubbing and condensing, are removed from the gas certain substances that would aeriously affect its usefulness as a lighting medium, and at the same time these substances are recovered and put to proper use. After the gas has been purified it is passed into large storage purified it is passed into large storage tanks called gas holders, from which it is drawn, or rather forced, into the various pipes, called mains, by means of which it reaches the consumer at the most distant point. It will not be necessary for the purpose of this article to go minutely into the details of the manufacture or distillation of coal gas. Any reader who desires to thoroughly understand it can obtain all necessary information from the standard ency-clopedias, or any of the numerous special publications treating on the subject.

But an old and simple experiment may be tried that fully illustrates what takes place in the retorts of the gas works. Take an ordinary elay tobacco pipe, fill the bowl with fine particles of pipe, fill the bowl with fine particles of gas coal. Then seal or cover the coal with fire clay. Next insert the bowl of the pipe into the fire, and in a few minutes apply a lighted match to the stem of the pipe, when the gas being distilled from the coal in the bowl of the pipe, will ignite. This is, of course, gas in its crude unpurified state but in gas in its crude, unpurified state, but in just about the same condition as coal gas was when originally used for light-

ing purposes.

The washings and other treatment that the gas undergoes in a modern gas the result of practical expe works & sted by the art of the chemrience. ct of the gas engineer being 1 illuminating medium free ist, the to obte and smell, and the chemiat what the substances were from a to fine rouble to the engineer, and that g to put these materials to com-Having made the gas and mercial L c. purified it, the next question is to store it for use, as gas is not required in the same quantity in the daytime as at night, and it would not be pessible to keep banks (sets) of retorts working sufficiently to supply the demands of the consumers at night. This is accomplished by passing the gas into the gas holder, sometimes called gasometer. These gas holders are immense inverted cups made of sheet iron and working up and down in slides, the lower ends

The pipes leading from the gas house Copyrighted, 1894, by David Williams.

of the holder being immersed in water.

where the process of manufacture is being earried on convey the gas into the holder above the water, and as the gas enters it causes the gas holder to rise until it is full, or raised up to its limit The main distributing pipe or pipes, which are taken from the holder, also project above the water, which forms the seal and keeps the gas from escaping, the pressure being regulated by a system of weights and pulleys.

Formerly when the holders were made of very heavy iron plates it was neces sary to relieve the pressure by balance weights, but the modern holders being comparatively light, it is sometimes necessary to weight the holders in order to give the desired pressure. It is very essential, in order to have perfect consumption and light at the gas burner,

The pit is generally made of brick and cement, and in cold climates the whole arrangement has to be housed in to prevent freezing of the water.

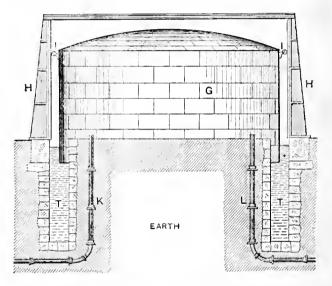

The Relation of the Plumber to his Client and the Community in which He Lives\*

BY WILLIAM P. MOFFAT

In selecting this subject I do not anticipate bringing anything especially new to your notice, but am desirous of so placing it before you that it may possibly assist some in feeling that the community of which they are a part are dependent upon them for something more than is represented by the dollars and cents which constitute "the plumbers' bill."

I desire to present the plumber first and

I desire to present the plumber first, and would say that very many whom I have

Gas and Gas Fitting .- Fig 1 .- Section through Gas Holder.

that the pressure should be constant This can be and of the right force. attained, to a certain extent, by adjustment of the holder at the works, but as coal gas is lighter than the air it in coal gas is lighter than the air it in creases in pressure according to hight at the rate of about one tenth for every 10 feet. That is, if gas is de livered into a building at the lower story at, say, four-tentha pressure, it will be five-tenths pressure 10 feet above the lower atory and go on increasing according to hight.

ing to hight.

The same disturbance of pressure takes place if gas has to be distributed on levels above the gas works. For this reason some form of pressure regthis reason some form of pressure reg-ulator is necessary in high buildings, or in buildings situated on high ground. Of these governors and the necessity for them we will treat at greater length in a future article. The accompanying sketch, Fig. 1, shows a section of a gas holder. G, gas holder; H H, guides or steadying frame, on which work rollers I I, which are attached to G. TT, tank or pit filled with water into which G descends when emptying or empty; K, pipe entering holder above water line for letting gas in—that is, the charging or filling pipe, while L is the discharge or main distributing pipe.

become acquainted with do not thoroughly appreciate their position. They have not had the opportunity of graduating from any college which can lend brilliancy by attaching a haudle to their names, and so they come humbly rendering services which are vastly out of proportion to the recompense they receive, and are not properly appreciated by their patrons. How can this be remedied so that those of our profession may receive the honor and respect which is properly due them? Much of this lies with the plumbers themselves and the pecuniary necesities which surround them, and I therefore refrain from harsh criticism when I find some one has sold his "birthright for a mess of pottage."

#### UNDERBIDDERS.

UNDERBIDDERS.

I acknowledge that there are those in all professions who will underbid to secure the patrons of their fellow craftsmen, and it would seem at times un our calling as if the necessity or the desire for the almighty dollar was of more value than the honor of doing right because it was right, of standing up for a principle that experience has taught was of very much more value to those who through ignorance of its value would give their patronage to a lower hidder; then learn, through the loss of health or loved ones, that there was something that the specification did not specify, and which now—alas—cannot be bought. It is this honor, this determination to so adjust the sanitary arrangements of the commu-

<sup>\*</sup> Essay presented at the Detroit convention of the National Association of Master Plumbers, June 19-21, 1894.

nity in which we live that we shall be blameless, and that money shall not tempt us to do a thing that we know is in any way dangerous or may become so by the usage of the ignorant. It is this staud for the right which elevates the profession which you have selected for your livelihood. It is this determination to do your work right which elevates you in the eyes of the community, and will make you sought after, and it is this same quiet persistent purpose that is sure to bring its reward. Am I setting too hard a task when I ask you to ponder this well, while the unscrupulous reap the harvest? I think not, for "Thou art thy brother's keeper," and the lives of many are intrusted to your care. If you enjoy the confidence of your customers you can guide them in the selection and arrangemany are intrusted to your care. If you enjoy the confidence of your customers you can guide them in the selection and arrangement of the plumbing in their dwellings, the quality and design of the goods best adapted to the place. Do not be afraid to give the true reason why your selection is the best for the place, but above all be positively correct as to theory or practice in the statements you make, explaining in the plainest language possible why this or that fixture must be so placed. Do not think this is all thrown away because they have not made it the study of their lives and cannot properly appreciate it. You may make a mistake. They may have absorbed some sauitary ideas and tha fact that you are thoroughly posted in your own profession will inspire them with the confidence that is due you, and is the only true advertising that is admissible in your calling. For "from the abundance of the beart the mouth speaketh" and it would be just about impossible for your customers who believe in you to keep it all to themselves. Just here let me deviate a little and say a word about advertising.

#### GOOD BUSINESS MEN.

We all want to be known as good reliable business men, and there is nothing so thoroughly good as an advertisement as work which is thoroughly satisfactory to our customers. I knew of a plumber who

ousiness men, and there is nothing so thoroughly good as an advertisement as work which is thoroughly satisfactory to our customers. I knew of a plumber who finished a building for his customer and the first repair was five years after and amounted to \$1.50. Another gentleman told the writer be had the best plumber in the city, and meant it. Such advertising you never see in the papers. Another example was the modesty of a great physician. He simply had his name P. Mix. That was sufficient. His work like his name was well known to those in need of his services. I do not say anything against the proper placing of your name before the public, but the assumption of titles seems to be a misrepresentation of facts.

To return to our subject. Allow me to explain just what I mean by "positively correct." I hope none will misconstrue this to such an extent that the plumber's preference for certain lines of goods shall make his wishes an intrusion. There are many who presume to know just what is the best and the best way to arrange them, so much so that you may feel that all your experience has gone for naught; that a young man who can get up a good design in decorating a dwelling will place fixtures in inaccessible places and specify arrangements which will disgrace you if carried out. Now is the time for you to lay down the principles upon which fixtures in other parts of the house may affect these; the danger there is in doing as directed, and it is necessary that your statements are positively correct and your language so clear and forcible that you shall carry everything before you. Do not think for a moment that if they do not readily accept your argument and still adhere to having an improper arrangement of the pipes, fixtures. &c., you are released from the responsibility of your work; not at all. If you have done the work improperly and bad results follow, you will be blamed and injured by it. It will not make any difference what you may say about it, there is your work and the bad results Do not do it Keep you old pipes and put in new ones correctly. You may think he was well punished, but he used it unjustly against the plumber 15 years afterward, not stating that he would not allow new ones to be put in, although

the probable results were plainly stated by the plumber. Dismissing this unpleasant part of the subject let us look at our pro-fession from the clients' position. When they send for a plumber they expect to have skilled labor.

#### LEGISLATION.

LEGISLATION.

The Legislatures of a number of our States have done all they could to guard the people against the blunders of the ignorant, not allowing a man to practice until ha was duly qualified. The people knowing these things have a right to expect none but the best class of work, put together in such a way that it will give satisfaction. This is not always done. I have lately seen three houses that surely had less than 10 pounds of solder in the whole job. All joints that could be made as cup joints were so made, even to branch joints, and so poorly done that I should have expected to see them all leak. This is certainly not skilled labor and should be condemned wherever found. A person employing licensed and registered plumbers is supposed to get those who are responsible, and they who are such should look carefully to their workmen, that all work is put together in a thorough and workmanlike manner. There are many things that are troublesome and will occur repeatedly and are an aggravatiou to the household and a call to do such repairs should be explained to the owner, so that when the familiar expression "leaks in the same place" accompanies the order, you are prepared with the other equally pleasant "I told you so."

Both the above expressions are better unsaid, as they do not tend to good feeling, and repairs are not the class of work that

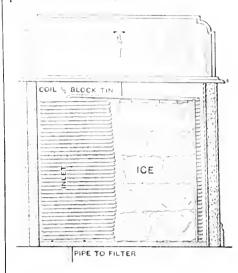

Both the above expressions are better unsaid, as they do not tend to good feeling, and repairs are not the class of work that are calculated to increase especially the value of the property of your client. Although it may save him damages, it is money spent usually to put the property back in a proper condition, as it was supposed to be before, and he is that much out of pocket.

In closing, let me ask you to faithfully adhere to a principle to do the best work possible, and let nothing turn you aside from that purpose.

#### Large Capacity Water Coolers.

The comfort derived from cool water for drinking purposes has always been appreciated, but at the present time it is considered indispensable in the hot seasons. The expense of the ice bill when ice is used for cooling purposes reaches a considerable figure in factories, hotels and restaurants. Some of the devices used to reduce this expense and to furnish an ample aupply of water are shown in the accompanying illustrations. Fig. 1 shows an apparatus built for use in a large restaurant in New York, where about 6000 people are served within the space of two hours at midday. It was built by E J. Brady of 58 Warren street, New York, and consists of a large box lined with tinned sheet copper, the inside dimen-sions being about 12 inches wide, 30 inches long and 30 inches deep. In the box a coil of 1 inch block tin pipe was used, through which the water passed. This was wound around the box until about 150 feet of pipe was used. Water was brought in from the street main to a filter, and after passing through the filter was connected to the coil at the top. The water after passing through the coil of pipe was conveyed through a pipe to a faucet where it was drawn as required, and in the restaurant ran almost continuously at midday. In order to protect the pipe from being crushed by the ice that filled the box a wooden frame work was placed in front of the coil of pipe. It is said that from 25 to 33\frac{1}{25} per cent. of the ice bill was saved by this method of cooling the water over the previous method of having large pitchers on the restaurant tables fitled with small pieces of ice, or the use of a large water cooler into which the ice was placed with the water which was drawn through a

The satisfaction attending the faucet. use of this device has been infinitely greater than that of either of the more primitive methods mentioned.

Large Capacity Water Coolers -Fig. 1. -A Restaurant Cooler.

The second apparatus, shown in Fig. 2, was made by Boyd & Schnaier, 347 Columbus avenue, New York. They placed an icebox in the basement of an

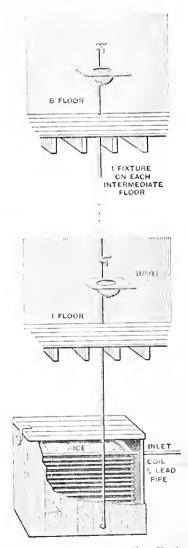

Fig. 2.—Cooler for a Building Having Several Floors.

eight story building in which about 100 hands are employed on each of its floors. The box is about 3½ feet deep, 3½ feet wide and 6 feet long, and has a cover

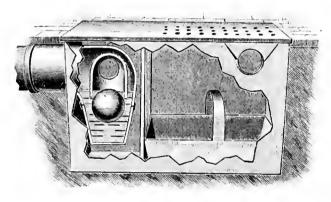

which is secured by means of a padlock after the box is filled with icc. - A bout 300 feet of  $\frac{3}{4}$  inch lead pipe is used in this box, the water from the street main being brought into the top of the coil and the pipe continued from the other end of the coil up to the top story of the building, through the toilet rooms, which are directly over one another throughout. A branch is taken off the pipe in each of the toilet rooms by means of a long faucet, which drips im mediately over the lavatory bowl should a leak occur. The box is made to hold a ton of ice, and the calculation is that when filled on Monday morning and the cover locked down tight there will be no need of replenishing the ice for a whole week. By this means cool water is abundantly supplied the employees as required, there is no danger of the ice being abstracted in small pieces and at the same time the labor of attending to several water coolers is avoided.

## Catch Basin and Back Water Trap.

We present in the accompanying illustration a catch basin and back water trap manufactured by Emmett Martin, Fort Wayne, Ind. The device

illustrated. The later pages of the book are given up to gas stoves and ranges of all sizes and aorts. Water heaters, burners and other goods are noticed; likewise hot air engines, hydrants, &c. Attention is similarly directed to the Climax cellar and cosspool drainer and the Climax Solar water heater, both of which have been described in our columns. Accompanying the eatalogue is a small paniphlet of testimonials, which come from all parts of the country, regarding the Climax gas machine and mixer. These testimonials are dated and signed and speak in high terms of this apparatus.

THE MASTER PLUMBERS' ASSOCIATION OF CHICAGO have issued a very handsome volume entitled "Chicago Master Plumbers' Reference Book." It was compiled by Alexander W. Murray, secretary, and edited by H. W. Culbertson. It is of pocket size, leather bound, contains 92 pages and is beautifully printed and illustrated. The contents comprise the roll of officers for 1894, constitution and by-laws, Baltimore resolutions with amendments, the Chicago apprenticeship system, history of the association, lists of officers for each year, portraits and sketches of presidents, a collection of interesting

Catch Basin and Back Water Trap.

consists of a cast iron basin with an outlet at one end and a perforated removable top plate. A galvanized iron pan is provided beneath this plate to catch and retain sediment, being removable for cleaning. By means of a partition in the basin the solid matter is prevented from entering the trap portion. The device is so constructed that the water from the basin enters through an opening into a tube with a ball float at the bottom and passes out through openings at the end of the basin, 2, 4 and 6 inches in size. To provide against back water, caused by heavy rains, rising of the tide or other means of flooding the sewer, the ball valve is so arranged as to float up and press tightly against the bottom of the inlet. preventing the entrance of water to the cellar in which it is placed. By this means, the maker claims, not only is an effectual back water trap provided, but also a very secure seal against sewer air.

#### TRAPS AND VENTS.

WE ARE INDEBTED to the C. M. Kemp Mfg. Company, Baltimore, Md., for a copy of their catalogue relating to the Climax gas machine and gax mixer. This volume, which has just come from the printer's hands, contains some 50 pages and opens with a full illustrated description of the Climax gas machine, showing it in operation, its different parts and all the details of construction. The Climax gas mixer is similarly

and valuable miscellany on a great variety of subjects of special interest to the plumbing fraternity and a list of the members of the Chicago Master Plumbers' Association. Advertisements are alternated with reading matter through the last half of the work.

Herwood & Ansell is the name of a new firm who have started in the plumbing and tin business at Mount Jewett. McKean County, Pa. They request that plumbing and tinners' supply houses forward them their catalogues.

A VERY APPROPRIATE and at the same time catchy advertising leaflet is a scarlet card bearing the inscription: "This red hot weather makes you feel as if you wanted to be played on by some of Colwell Lead Company's hose."

At the annual meeting of the Board of Health of Camden, N. J., Harry B. Travers was appointed plumbing inspector.

BRINTNALL & FERGUSON. 77 West Chippewa street, Buffalo, N. Y., are one of the newer plumbing houses of the city. They make a fine display of modern plumbing apparatus in their sample room. This firm make a specialty of fitting for both artificial and natural gas, as well as ateam and hot water heating.

THE ZERO VALVE COMPANY, 212 Seneca atreet, Buffalo, N. Y., report that they have sold over 1500 of their Vollmer valves in Buffalo in the past seven months. This valve is used in connection with hopper water closets, and is arranged to waste all the water from the closet above the valve after the apparatus has been used, by which means, it is claimed, freezing is prevented.

Howe & Bassett are one of the large plumbers' and steam fitters' supply houses in Rochester, N. Y. They carry in stock plumbers' pottery, bathtubs and brata work. They also have an extensive line of cast and malleable pipe fittings and pipe, and are provided with mechinery whereby they can cut pipe to specification up to 12 inches in diameter. The Electric steam and hot water boilers of the Electric Boiler Company are made in their plant. Excellent reports have come in from the boilers which were set during the past year. Some of their constructions are in use as power boilers with satisfactory results. The patterns for a larger size of the boiler are completed, and some new features have been added to them.

J. H. Castle, Buffalo, N. Y., was unable to attend the plumbers' convention, to which he was elected a delegate, owing to pressure of business at home. His show windows make a fine diaplay of practical plumbing work, showing enameled baths, water closets and lavatories, all the necessary connections in lead pipes being made with neat joints.

THE ROCHESTER LEAD WORKS, Rochester, N. Y., in addition to making a line of block tin and tin lined lead pipe and solder are making a specialty of babbitt or bearing metals.

EDWARD JOY, Syracuse, N. Y., who makes a specialty of plumbers' and steam fitters' supplies, recently fitted up a new sample room in which he shows the modern plumbing fixtures, prominent among which may be mentioned Mott's enameled bathtubs and Huber's water closets. In addition to this he has a gas fixture showroom from which all that is required for a modern residence can be selected. In his pipe and fitting department pipe can be cut to specification up to 8 inches in diameter, and all the fittings that would be required for a large heating plant are carried in stock.

The water pressure furnished by the water works of the city of Syracuse has been so low as to practically cut off the supply in the higher portions of the city, and the quality has not been all that could be desired. Recently water was turned into the mains from a new system, whose supply is drawn from another source, and a pressure of about 100 pounds is expected to be developed. This will enable persons living on the hills surrounding the city to inatall the conveniences of modern plumbing, which has heretofore been rendered impossible by lack of pressure. It is more than probable that the heavy pressure in the new supply will develop many leaks in the old plumbing systems of many of the buildings, and that the plumbers will find plenty to do in making repairs.

GARVEY & TORIN are one of the wide awake plumbing firms in Rochester, N. Y. In their sample room are shown the different fixtures required in a modern job of plumbing.

C. H. C. MOLLER, PEHR MOLLER and F. C. PHILLIPS have filed the articles of incorporation of the Moller Supply Company. The new company will have an authorized capital stock of \$30,000,

\$20,000 of which will be paid up. It will engage in the plumbing, steam fitting, mill supply and pipe business and will be located at 315 Nebraska street, Sioux City, Iowa.

THE GENESEE AUTOMATIC CLOSET COMPANY, Rochester, N. Y., recently sent 70 of their Genesee water closets to Cleveland, for use on two large lake steamers being built in that city.

The FIRM of William Jameison and Spencer M. Sterns, plumbers, of 3 Caroline street, Saratoga, N. Y., have been dissolved. Mr. Sterns will continue the business and Mr. Jameison will remain in his employ.

ADAM GRAF AND GEO. A. LINTON have formed a pertnership and opened a plumbing establishment on Pear street, Logansport, Ind.

FRANK C. Hock has rented the store room in the Drake Block, Goshen. N. Y., recently vacated by H. B. Levy, and will soon open it as a plumbing, gas and steam fitting and electric wiring establishment.

1. Mc Vov, plumber, has made ar rangements to occupy half of the store now used by D. S. Dunavan, the tinner, on East Front street, Plainfield, N. J.

Breckon & Galle have leased the store building on West Main street, Ionia, Mich., recently occupied by M. L. Steele, and will move their plumbing establishment soon.

JOHN O'KEEFE and C. L. Glennon, Appleton, Wis., have formed a partner-ship for the purpose of doing plumbing, steam and hot water heating. The situation of the new firm is at 880 College avenue.

## The New Tower Bridge.

The recently completed Tower Bridge, the latest and most imposing of all the bridges of London, was opened with great ceremony by the Prince of Wales on Saturday. The new bridge, which is the nearest to the entrance to the Thames River, has been erected for the purpose of relieving London Bridge of a portion of its enormous volume of traffic, amounting to an average of about 25,000 vehicles and 125,000 foot passengers daily.

The Tower Bridge is a double one, a combination of a high level and a drawbridge, the latter feature being rendered necessary by the fact that large vessels ascend the river as far as Londen Bridge. It is composed of two immense piers, each consisting of four hexagonal steel barrels, laced together by a network of lattice girders, the whole being filled in with brick and faced with stone. From the towers stretches a suspension bridge from bank to bank. The midspan is approached on either aide by a steep flight of stone steps, 140 feet in bight; but elevators inside the towers are also used for conveying foot passengers to the upper bridge when the draw spans are open. These latter are on a level with the roadway on the river bank and are technically known as bascules. Each bascule is 100 fect long and revolves on a 21 inch steel bar, When it is necessary to allow large vesscls to pass, the traps are lifted, the short leg of the bascule, inside the tower, being heavily weighted with lead and a space being left in the pier in which the half span ainks when elevated. The bascules are operated by very powerful hydraulic machinery.

## HEATING & PLUMBING.

#### NEW WORK AND CONTRACTS.

THE WORK for heating with steam the school buildings at Glenville and West Liberty, W. Va., has been let to Trimble & Lu z. Wheeling, W. Va.

A. C. HICKEY, 69 South Clinton street, Chicago, is to do the plumbing and sewcrage for the Stone Shoe Mfg. Company, Pontiac, Ill.

THE J. L. MOTT IRON WORKS, 311 and 313 Wabash avenue, Chicago, have lately received a number of orders for Sunray heaters from various points in Iowa.

- F. W. Lamb & Co., 258 Michigan street, Chicago, have the contract for steam heating in the flat building of Evan Lloyd, Forty fifth street and Cottage Grove avenue; also overhauling the steam plant in the American Express Building, Monroe atreet.
- T. C. Poyd. 38 Dearborn street, Chicago, is to do the plumbing, gas titting and sewerage in the building of Mrs. Mary Fourney, 309 Fifth avenue.

THE HERENDEEN MFG. COMPANY, 131 Lake street, Chicago, have the contract for sterm heating and ventilating the High School Building at Princeton, Ill., using two No. 8 Furman boilers.

THE WALCOTT-HURLBUT COMPANY. 175 and 177 Lake atreet, Chicago, have received the following orders for the Siphon Eduction closet range: Hillsboro Bridge, N. H., four ranges; Taylorville, Ill., two ranges for High School and two for Court House; Cedar Rapids, Iowa, two ranges for High School; Necnah, Wis., two ranges for High School.

The John Davis Company, 69 to 79 Michigan street, Chicago, are to install hot water heating plants in the 30 tlat building of Chas. Busby, Indiana avenue and Twentieth street, and in the flat building of Frank Bernhardt, 1623 Fulton atreet.

SEALED PROPOSALS will be received at the effice of the Department of Public Works, Buffalo, N. Y., until July 12, for the plumbing work to be done in Engine House No. 9 and Hook and Ladder House No. 1, at Engine House No. 21 and Ladder House No. 6.

THE PLANS AND SPECIFICATIONS are being prepared for improvements in the chapel of the Ninth Prosperian Church, Troy, N. Y. The estimates include \$3000 for heating apparatus, hot water probably being the method selected.

B. F. STURTEVANT & Co., Boston, Mass., have been awarded the contract for heating and ventilating the new Court House at R.chester, N. Y., the contract price being \$25, 120.

The Maltby & Wallace Company, Urbana, 111, have been awarded the contract for the steam fitting for the new Engineering Building. The contract price is close to \$8000.

THE CONTRACT for the plumbing and steam fitting for Fort Harrison, near Helena, has been awarded to Gould Bros. of Butte, Mont.

C. W. TALCOTT has the job of plumbing for the school house at Rumford Falls, Maine, and F. O. Walker will put in the heating apparatus.

THE NIAGARA FURNACE COMPANY, Buffalo, N. Y., who make a specialty

of the Novelty line of heating apparatus, recently closed a contract with the Buffalo Cement Company for placing hot air furnaces in 25 houses being erected by them. The Novelty hot air furnaces will be used.

HAYES & FALLS, Rochester, N. Y., have the contract for the heating plant in the Memorial Universalist Church at Albion, N. Y. Steam will be used and both direct and indirect radiation.

- E. P. Bates, Syracuse, N. Y., is a heating engineer whose growing business requires him to do work in eithes quite distant from his plant. He recently it stalled a hot water heating plant in the residence of J. J. Hill, at St. Paul, Minn., in which the principal heating maln was 8 inches in diameter.
- T. COSTELLO & Co., Lowell, Mass., have been swarded the contract for heating and ventilating apparatus for the Pond Street Primary School at the price of \$365.
- T. P. AITMIN has taken the contract to do the plumbing and heating of Frank Spencer's new house, on the corner of North Main and Union streets, Manchester, Conn.

Thomas F. Mullen, Scianton, Pa., has been awarded the contract for the illuminating, steam fitting, sanitary and roof work of the new Hotel Jermyn.

THE STATE BOARD OF NORMAL SCHOOL REGENTS advertise for bids for steam heating the Oshkosh, Wis., Normal School.

Nine hundred men were laid off work at the Brooklyn Navy Yard on Monday in consequence of the decision of Attorney-General Olney that the resolution extending the naval appropriations for one month, which had passed both Houses of Congress and received the President's signature, does not include the work being done under "increase of the navy." The vessels affected by the stoppage of work are the turret ships "Puritan" and "Terror," the gunboats "Castine" and "Machias" and the armored cruiser "Maine." This unexpected loss of employment is a great disappointment to the mechanics and laborers, who had confidently expected an uninterrupted season of work during the summer. Workmen in the other Government yards shared a similar experience.

The records of the Bureau of Navigation show that during the first three-quarters of the present fiscal year there were tuilt in the United States and officially numbered 339 wooden sailing vessels, of 24,271 tons, and 221 wooden steam vessels, of 29,948 tons. During the same period 3 iron or steel sailing vessels were built, of 4749 tons, and 27 iron or steel steam vessels, of 26,920 tons. The sailing vessels aggregated 342 in number and 29,021 tons in measurement. The steam vessels aggregated 248 in number and 56,869 tons. The entire number of vessels built and numbred was 590, the tonnage being 85,890.

In order to avoid undue competition and to maintain prices, a combination will, it is said, be formed by nearly all the California fruit canners, under the name of the California Cannery Company.

According to present indications, the prospects for fair average crops are reported as good in Canada.

## STEAM AND HOT WATER.

#### The Yale Water Heater.

A new water heater is illustrated here with which has been brought out by the J. H. McLain Company of Canton, Ohio, who have branch offices in Bos-ton, New York, Chicago, Denver and San Francisco. The Yale is an addition to their line of house heating apparatus, being intended for heating small greenhouses, stables or cottages and for heating water for domestic purposes in hotels and apartment buildings. Ex-

### Greenhouses on Wheels.

Agriculturists generally, and horticulturists in particular, whether ama-teur or professional, says the London Pall Mall Gazette, will be glad to hear of an important innovation which is being introduced by the Horticulture Traveling Structures Company. The novelty of the idea consists in the green. houses, or plant protectors, being provided with wheels constructed to run on a permanent or temporary rail track,

fected, as the houses run so lightly that one of, say, 15 x 12 feet can be instantaneously moved by one man, so that advantage can be taken of even a passing shower. Ground, moreover, undergoing cultivation by the aid of one of these structures is periodically exposed to the action of sun, air, rain and frost, which are most destructive to the parasitic fungi, bacteria and even insect pests, which thrive in the close and moist conditions of the ordinary fixed structures. The hot water apparatus moves with the structure, and thereby saves the cost of extra piping and boilers; and among the many other advantages claimed by the company for their patents, two may be cited which will be readily appreciated by all classes —i. e., that being movable, no doubt can arise that they are tenant's fixtures, and consequently they do not entail increased assessment for rates and taxes.

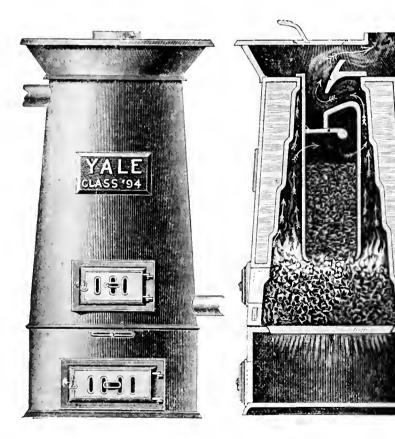

Fig. 1.-General View of Heater.

Fig. 2 -Sectional View of Heater.

### THE YALE WATER HEATER.

terior and sectional views are here shown in Figs. 1 and 2. The sectional shown in Figs. 1 and 2. The sectional view discloses the magazine attachment, which, however, if desired, can be taken out, making a surface burner of the heater. The magsz'ne is provided with a damper which closes automatically when the magazine is filled with coal, thus preventing combustion of the coal in the magazine. It will readily be seen that an excellent heating surface is obtained by constructing the inner walls of the fire chamber in a series of projections, making the heater much more effective than where the fire chamber presents a smooth surface to the flames. The grate and ash pit are the same as those used in the company's Humbert heater. Three sizes are made, which are felicitously styled class '93, class '94 and class '95

by which means the same structure will perform the work which would by the old system require a series of such shelters, thereby effecting an enormous saving in original cost and ultimate maintenance. For instance, a house which under ordinary circumstauces would have lain idle during a large portion of the year will, by using one of the structures referred to, be in constant use for protecting and cultivating crops, and in the case of growers who, by the pressure of competition, have been forced to a coustant use of their houses, instead of having to carry in batches of plants from the open air, there will be a vast saving of time and labor by s mply moving the whole structure, as supplied by the company, bodily over the plants as they stand. A great saving of labor in watering is likewise ef-

#### HEATING NOTES.

THE HEADQUARTERS of the Executive Committee of the Master Steam and Hot Water Fitters' Association of the United States for the ensuing year will be at Room 732 Cable Building, Hous-ton street and Broadway, New York, to which all communications should be ad-

THE TRADE will be sorry to learn that E. N. Squires of the New York Cen. tral Iron Works met with an accident while returning from New York, where he attended the meeting of the Master Steam and Hot Water Fitters' Association of the United States. Mr. Squires injured his ankle, and it will be some weeks before he will be able to go about without crutches.

M. MAHONY, Troy, N. Y., continues to publish his monthly calendar cards, the one for July, which is just at hand, being overspread by the American

THE ROYAL STEAM HEATER COM. PANY, Gardner, Mass., are occupying their new huilding, 40 x 60, three stories high. This will contain a well equipped machine shop, and be used in connection with their foundry for the manufacture of Royal steam heaters.

THE SYSTEM of steam disinfection for clothes, &c., of contagious patients, as designed and applied by Blake & Williams, 186 and 188 South Fifth avenue, New York City, has been adopted by the Board of Health, city of Brooklyn, to be erected in the hospital building at Flatbush, L I. The same system is in operation in hospital buildings for health departments in other cities, and in buildings for the State of New York.

THE J. H. McLAIN COMPANY, Canton, Ohio, are sending out a catalogue of steam and hot water heaters, inclosed in embossed covers, showing a hand-some design in gilt, red and black with a light blue background. On the front Canton, Ohio, and branch offices at Boston, New York, Chicago, San Francisco and Denver. The printing is in two colors, the cuts and display matter being in handsome garnet, while the letterpress is in a pleasing tint of green. A view of their plant is shown, followed by illustrations of the Humber water heater, with sectional views showing the construction and operation; the Hartford hot water and Cambridge steam heater, with sectional cuts, as well as of the Sandow and Yale water heaters. The catalogue also illustrates their Oxford hot air furnace, which is provided with an air blast for carrying hot air to the top of the fire pot to aid in consuming the gases generated at that point.

THE IDEAL BOILER COMPANY, Chicago, issue a notice to the trade, under date of June 26, that they have secured the services of Herbert E. Jones to represent their line of Ideal bollera in New England. Mr. Jones was formerly manager at the Boston office of the American Boiler Company and will have his headquarters at Boston as soon as a suitable location can be found.

THE BART. RYAN HEATING, VENTILATING & PLUMBING COMPANY have been incorporated at Chicago with a capital stock of \$20,000, the incorporators being Bartlett Ryan, Cornelius Ryan and Charles Smith.

HARDING BROTHERS, Sioux Falls, S. D., according to an item in a local paper, had the honor of making the first steam boiler ever put up in South Dakota. It is a 40 horse power boiler and will be placed in Gilbert's new building on Philitpa avenue.

THE NIAGARA RADIATOR COMPANY, Buffalo, N. Y., are erecting a manufacturing plant at Tonawanda, a few miles from Buffalo, where they expect to have an annual productive capacity of 1,000,000 feet of radiation. Their plant interesting from the fact that a number of new features are introduced in the methods of turning out both direct and indirect radiators.

The Brotherhood of Locomotive Engineera will not join the atrike ordered by the American Railroad Union. Chief Arthur, of the Brotherhood, has telegraphed the following laconic message to the engineers: "Stick to your engines." Grand Chief Sargent of the Brotherhood of Locomotive Firemen has also issued a statement intimating that his organization can take no part in the Pullman boycott, as the laws of the Brotherhood do not allow it, and he, as its chief executive officer, has no authority to order a sympathetic strike. He further warns Brotherhood firemen who join the strike that they must look to the A. R. U. for relief and not to the Brotherhood.

East bound passenger steamers leaving New York are crowded with both cabin and ateerage passengers. Agents of all the transatlantic companies say that this year's passenger traffic to Europe is unusually heavy, and some of the lines are said to be enlarging their carrying capacities in consequence.

The Manhattan Elevated Railroad Company are experimenting with different electric motors with the view of using electricity for traction in place of steam. They will probably await the outcome of the Chicago Elevated's experiments in this direction before finally deciding on the change.

## Electrically Driven Ventilating Fan

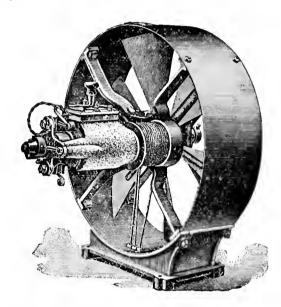

The Huyett & Smith Mfg. Company of Detroit, Mich., make a fan designed to be driven by either a pulley or electrically, by means of what is known as the Fuller patent electric motor, which is provided with a three-speed switch. The pole pieces of the motor being parallel with the fan shaft, the spider or arms of the fan frame being utilized as a keeper of the two magnets, the breaking space of the poles is brought into a vertical position, removing all danger of short circuiting the magnetic lines of force across the poles, which is done by the fan blades in the use of an ordinary motor. The commutators are built of numerous sections thoroughly insulated with mica, which is an additional safeguard against short circuiting and "burn outs," from which no difficulty is experienced in the use of

Woodlawn avenue and Fifty-eighth street.

Markin & Co., Incorporated, Allegheny, Pa., have just installed a complete outfit of machinery for turning out plain round and corrugated conductor pipe from 2 to 6 inches in diam eter and in 10-foot lengths. This firm have considerable business on hand for conductor pipe, eave troughs, skylights and other goods which they manufacture

The John Siddons Company, Rochester, N. Y., make a specialty of architectural copper and galvanized iron work, and tile, alate, metallic and cement roofing. They occupy a large building and devote some of their time to the manufacture of sheet metal work for heating and ventilating plants.

The St. Paul Roofing, Cornice & Ornament Company, Sou h Wabasha street, St. Paul, Mian., favor us with

ELECTRICALLY DRIVEN VENTILATING FAN.

this motor. This combination of motor and fan are kept in stock with motors wound for 110 and 220 volt currents; they are also furnished wound for any voltage.

### FLASHINGS.

The Jersey City Galvanizing Company have just placed machinery in their works for the manufacture of riveted sheet iron piping, plain and galvanized, and are now making a special feature in the production of house leader pipe at a low cost to the buyer. They have also the most approved machinery for corrugating, crimping and curving sheet iron for roofing and architectural work, as well as facilities for general galvanizing business. The company are unusually busy for this time of the year and full of orders.

Among the contracts taken by Thomas Allen, proprietor of Al'en's Cornice & Corrugating Works, 422 and 424 West Randolph street, Chicago, can be mentioned the following: Red slate rooing and copper work for residence of W. C. Foley, Boulevard place and Grand Boulevard: red slate roofing, copper and galvanized iron work for residence of W. S. Forrest, 3264 Groveland avenue; late roofing and galvanized iron work for residence of Mrs. M. L. Freeman,

a large advertising card such as they are now distributing to the trade, calling attention to Pruden's patent slip joint siding plates for store fronts and building walls which they manufacture. They also make sheet metal roofing and siding, cornices, skylights, steel brick, ceilings, &c.

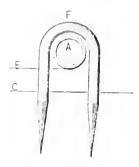

Thomas Talbott, Syracuse, N. Y., is engaged on a \$25,000 contract for furnishing the steel roofing and galvanized iron cornices for the Government buildings at Plattsburgh, N. Y. One of his recent contracts was for the Matteawan Asylum, at Matteawan, N. Y. Sixty-five tons of sheet iron were used in this work, 25 being required for the roofing and cornice work, the remaining 40 tons being employed in the cold air inlets, radiator boxes, heating flues and ventilating shafts to the roof.

McGraw Brothers, with offices in both Buffalo and Rochester, N. Y.. make a specialty of the Medal brand wire edge ready roofing. It consists of a very durable felting, protected by water proof material, and having wire placed in the edges, giving, it is claimed, great strength, and at the same time permitting the making of secure lock joints and fastening at the laps. It is claimed to be fire proof, and is said to stand for years without of linseed oil.

# THE LETTER BOX.

#### Staple Driver.

From W. N., New York.—We recently put up some copper tubing on the outside wall of a building, the tubing being fastened by means of staples, driven into the mortar joints of a brick wall. A, in Fig. 1, and B, in Fig. 2,

Staple Drivers .- Fig. 1.-Staple and Tube.

represent the full size section of the tubing which was used, and the staple shown in Fig. 1 indicates the size which was required to fasten the tubing. We first loosened the mortar

Fig. 2.—Bent Staple.

sufficiently to allow the staple to enter the joint about \$\frac{a}{5}\$ inch, and then with successive blows with the hammer against the point F of the staple, Fig. 1, it was found that instead of the

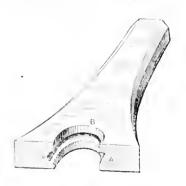

Fig. 3.-Staple Driver.

staple entering the joint it would spread out as shown at H, Fig. 2. To avoid this we had a tool made of steel, as shown in Fig. 3. which for the want of a better name I should call a "staple driver." The illustration in Fig. 3

represents it one half full size, and as will be seen it tapers to an octagon at the top. The curve shown at B should be made a little smaller than the size of the staple used, while the groove shown from A to A should be cut so that the staple will go in casily; then, having the staple slightly fastened in the joint, as before explained, and using the staple driver and hammer, the staple can be driven in the wall with ease and still retain its original shape. In practice two sizes of staple drivers are used, one where the curve B, F'g. 3, will be cut out so as to reach down to line C, Fig. 1, and then after the staple is driven as far as possible the smaller size, as shown in Fig. 3, was used, which brought the staple tight against the tubing and flush with the wall line, as indicated by E, Fig. 1.

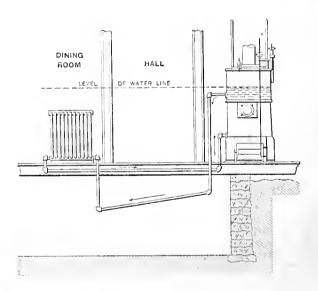

## Hot Water Heating from Steam Boiler.

From W. H. Page, Norwich, Conn.— Seeing the letter of "Rex" in The Metal Worker of May 19, I send you a sketch of a hot water radiator heated from a

#### Choked Water Backs.

From W. D. A., Fargo, N. Dak.—
Having read the letters in The Metal Worker on choked water backs, would say we are troubled here somewhat with alkali in water backs, which forms a coating almost as hard as stone, and the only remedy we have found is to put in a new coil of water back. In one case I found a 2 inch coil in hotel range so filled with this hard alkali substance that there was only a \(\frac{3}{2}\)-inch opening left for the circulation of the water. It sometimes would be really dangerous to use the coils.

The Columbiau International Colonization & Improvement Company have been organized and incorporated under the laws of Louisians, with a capital atock of \$5,000,000, for the purposes of "building up South American countries"—something of a Herculean task—"and establishing closer trade relations with them." The company have, it is said, as their initial operation purchased several thousand acres of very fertlle rolling land in Rio Hacha dietrict, on the Cana River, in the republic of

Hot Water Heating from Steam Boiler.

ateam boiler. The dining room in which the radiator is placed is on the same level as the basement in which the steam heater is located, and as there is a hallway between the two rooms it was necessary to run the pipes as shown in the sketch. A hole was drilled in the edge of one of the sections of the boiler below the water line and the pipe taken cut, then dropped down with a strong pitch, as it had to pass under a timber; then it rose directly up and connected with the bottom of the radiator at one end. The return was taken from the opposite end of the radiator and back to the boiler, connecting at the regular return. All of the building above this floor is heated with ateam. I could send you sketches of other jobs, but they are so similar to the one illustrated that they would hardly prove of interest.

Colombia, which they propose developing into an important trading and agricultural settlement. Piers and a railroad are to be built and a line of steamers chartered. The headquarters of the venture are at New Orleans, from which city most of their capital has been drawn, A number of prominent and influential Louisianians are said to be interested in the scheme.

Late advices received from Madrid by the State Department indicate that the proposed increase in the Cuban tariff is unlikely to take effect before July 20. It is, moreover, considered extremely doubtful at the Spanish capital that Spain will abolish the existing reciprocity arrangement with the United States for several months, if indeed the whole matter is not dropped altogether.

# TIN PLATES.

#### SCRAP.

THE TIN PLATE WORKS AND ROLL-INO MILLS of the St. Louis Stamping Company, St. Louis, Mo., are reported as being full of work on material for home consumption and on outside orders. The company have 18 tinning acts in active operation, producing a full line of bright charcoal and coke plates and roofing ternes.

E. G. EDWARDS of Swansea sailed from New York Thursday, July 5, for France on his way to Russia, where he has recently introduced the Edwards patent tinning apparatus.

THE TOTAL NUMBER of workers in the tin plate mills of Great Britain in 1891, according to the census returns for that year, recently published, was 46,240, of whom 39,702 were men and 6538 were women and girla.

A FOURTH OF JULY PUBLICATION OF the American Tin Plate Company of Cincinnati, Ohio, is a card with a cartoon upon it showing the American Eagle carrying off the British Lion, the latter being held down by a caricature of the Chief Magistrate. A red, white and blue ribbon is a further decoration of the card.

THE 36 BOX RULE QUESTION is still giving great trouble to British tin plate There are signa, howmanufacturers. ever, of a weakening on the part of the mer in some quartera. The workmen at Phillip's Lion Works, at Mantyglo, Monmouthshire, have offered a con-cession of 15 sheets per box till October next, which offer has been accepted by the management; and those at the same proprietors' Abertillery Works, at Newport, have agreed to a concession of 10 sheets per box for aix months. Efforts are being made by other manufacturers to arrive at similar arrangements with their men, but for the most part unauccesafully.

THE OLD CASTLE TIN PLATE COM-PANY'S Works, Llanelly, South Wales, were restarted this week, and several other Welsh tin plate establishments are reported as preparing to resume.

THE town of Cambridge, O., appears to be on the eve of a legitimate boom. Two weeks since some local capitalists commenced the formation of a company to build and operate black plate mills. Their plan of operations was similar to that recently so successful at Washington, Pa. The Cambridge Fair Grounds were purchased and laid out in building lots, 220 in number. These were dis posed of in ten days, and ultimately a profit of \$15,000 will be realized from the transaction. This will be applied by the company toward the erection of aix tin milla—i.e., mills designed for the manufacture of black plates for tinning. It is also probable that tinning pots will afterward be added. The plans of the mills will be made by A. Beard, New Philadelphia, O., who will also act as supervising engineer. Work will be commenced within 30 days, and we are authoritatively informed that the company will be incorporated this week. In addition to this enterprise others are in view for Cambridge. The Cambridge Iron & Steel Company have purchased about 5 acres of ground adjoining their present plant, and ex pect in the near future to crect tin mills thereon. The Cambridge Rooting Company, whose business has steadily increased to the consumption of about 2000 tons of black and galvan zed sheets per year, have for some time had the matter of building sheet mills under consideration, and will probably take action Another company of Eastverv soon. ern capitalista are considering the advantages of this locality with a view to the erection of tin mil's and an open hearth steel plant. Cambridge has an abundant supply of cheap and good coal and excellent railroad facilities. These advantages, together with good water sultable for boilers, are the attractions which interest the projectors of the plants described.

#### A Chicago Electric Elevated Railroad.

The use of electricity as the motive power on the Metropolitan Elevated Railroad in Chicago is now assured. The contract for the necessary equipment was placed on June 22, and is asid to be the most important electrical contract that has been closed in the United States for a year. The officers of the company have been making extensive investigations for some time into the relative cost of running their trains by steam and electricity. At first they decided in favor of steam and made partial contracts for locomotives, but afterward were so strongly impressed by the claims made for electricity that they canceled the contracts and pursued their investigations further. They are now satisfied that they can effect a net saving of about \$200,000 a year by using electricity. The economy is accured by the use of cheaper fuel in the power house than is permissible under the boilers of the steam locomotives and by the lessening of the labor bill, due to the fact that no high priced enginemen and firemen are needed on the With this in view and with the object lesson sflorded by the Intra-mural Elevated Eletric Railroad in operation at Jackson Park last summer, the directors of the Metropolitan Company came to the conclusion to employ electrically transmitted power.

Bida for all or a portion of the electrical equipment were furnished by the General Electric Company, Schenectady, N. Y.; Westinghouse Electric & Mfg. Company, Pittaburgh, Pa.; Siemens & Halske Electric Company of America, Chicago; Walker Mig. Company, Cleveland, Ohio, and Electric Construction Company, London. Owing to the tarill on electrical machinery, the English company's bid was much higher than that of any American bidder. After due consideration the contract for the entire electrical equipment was awarded to the General Electric Company. The contract price is supposed to be in the neighborhood of \$200,000 or \$225,000. The contract covers the generators, switchboard, motors, line and construction work. Four generators are to be provided—two of 1500 kilowatts each to be operated at 75 revolutions per minute, and two 800 ki'owatt in chines designed for 100 revolutions. total initlal capacity of the station will be 4600 kilowatts, or over 6000 horsepower. The generators will all be directly coupled to the engines, but the type and make of the latter have not yet been annonneed.

At the start the road will be operated on a plan calling for 55 three car trains and consequently demanding the same number of motor cars. Each motor car will be supplied with two 100 horse-power motors—one ou each truck—and 110 motors will, therefore, be necessary. Series parallel controllers, improved somewhat over the type in use on the Intramural road, will be used, and the current will be transmitted to the motors by a third rail at 500 volte pressure. In general, the system of operation in use at the World's Fair will be adopted, but many details, such as the position of the motorman, and the question of open and closed cars, remain to be settled. The apparatus will all be of the standard railway type of the General Electric Company.

The management of the road is anxious to run trains early in the fall, and it is not unlikely that some temporary arrangement for obtaining power may be made if the genera ora are not ready for operation by that time. The Metropolitan Elevated Railroad will be the The Metfirst permanent all elevated road in the United States to be operated by electrically transmitted power. The main line is about 5 miles long, running due west between Van Buren and Congress streets, with a northern branch at Paulina street. The structure and stations are nearly completed.

The Northwestern Elevated Railroad, which is to be built on the north alde of the city, will also be operated by electricity. The promoters of the scheme announced that as their intention from the inception of the project. But the Metropolitan, with its structure nearly completed, will be the first in the field to operate without the use of

ateam motors.

The Cotton States and International Exposition at Atlanta, Ga., will open September 1 and close December 31, 1895. A bill now pending in Congress making an appropriation of \$200,000 to the exposition has been favorably reported by the House and Scnate committees. All of the Southern States are said to be co-operating cordially in the acheme, with a view of making it a striking exhibition of the industrial and general progress of their section of the Union. The exposition will not, however, be confined to the South, but will embrace the whole country, and include exhibits from Mexico, Central and South America.

Kridler & Koch have opened a tin shop in the G. L. Herr storehouse on South Market street, Youngstown, Ohio.

# THE RETAIL STORE.

#### The Champion Filter.

The accompanying illustrations show a filter offered by the Champion Safety Lock Company, 74 Frankfort street, Cleveland, Ohio. The filter is made of

stone through which the water filters. It is stated that it filters a gallon of water in five minutes under ordinary pressure, and that though filtering rapidly it extracts all impure matter, giving the water a clearness equal to that

of the purest springs. It is explained

Fig. 1.-The Champion Filter.

CHAMPION FILER

apecial metal highly finished, and as illustrated in Fig. 1 is convenient in size for attaching to any faucet. The

cut represents the filter half its actual signed to accommodate a number of size. In Fig. 2 the metal part of the goods which had heretofore been found filter is cut away, showing the natural troublesome to arrange conveniently.

of the purest springs. It is explained that cleaning the stone of the filth it extracts from the water is one of the natural and indispensable requirements of the proper working of the filter, and that it can be done easily in less than two minutes. A Y is furnished as in Fig. 3, also illustrated in use in Fig. 1, for attaching an extra faucet, so that water can be drawn off for general purposes without interfering with the filter, or to enable a person to draw the warm

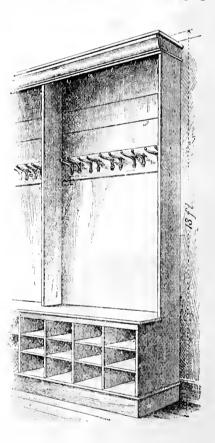

Fig. 3.-The Y for Extra Faucet.

water from the pipe so as to get cool water from the filter.

### An All the Year Round Rack.

We are indebted to C. T. Rosenthal, Batesville, Ark., for a sketch and description of the very useful rack illustrated herewith. It conforms in size to the shelving in the store and was designed to accommodate a number of goods which had heretofore been found troublesome to arrange conveniently.

The shelves below the ledge are 36 inches deep, the spaces above being 18 inches deep. In summer the 24 openings below are used for Axe, Pick, Maul, D Shovel and other Handles, Pipe Tongs, Blacksmiths' Tongs, Wood Bench Screws, Hames and Grass, Lawn and Bush Scythes. In winter the Scythes are replaced by Fire Shovels and Tongs, Grain Scythes are too long for the shelves and are placed upright in the space above the ledge immediately above the shorter Scythes. The openings above the ledge are used for Hay, Manure and Spading Forks and similar goods, the long handled articles, arranged in pairs, being hung on the large harness hooks, the space between just admitting the handles. The D handled goods are stood on the ledge, the handles resting against the wall between the handles of the hanging

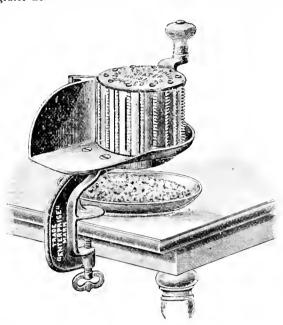

An All the Year Round Rack.

goods. In winter, when Hay and Spading Forks are out of season, they are replaced by long and D handled Shovels, Scoops, &c. At the top, above the harness hooks, large screw hooks are nsed for hanging Wood Saws, Coal Hods and Seed Sowers, each in their season.

H. LESTER, Rochester, N. Y., is changing the front of his hardware and stove store. He is putting in plate glass windows, and has erected a six atory building in the rear of his present location. He will carry a line of furniture, carpets and household goods in addition to the goods handled by him in the past.

#### Enterprise Grater No. 93.

The Enterprise Mfg. Company of Pennsylvania, Philadelphia, for whom J. C. McCarty & Co. are agents, 97 Chambers street, New York, are offering the tinned grater herewith illustrated. supplied, so that lemonade may be shaken. The extractor and two glasses make the combination juice extractor, shaker, strainer and mixer, and are packed together in one box. In Fig. 2 the set is shown made entirely of aluminum with the extractor locked between

Enterprise Grater No. 93.

In use it is clamped to a table or shelf and the article to be grated is placed on the platform and fed or pushed against the revolving cylinder. The grater is especially adapted for grating horseradish, cocoanut, &c, and can no doubt be used for many purposes by hotels, restaurants and private families.

#### Aluminum Juice Extractors.

The cuts here shown represent alumicum juice extactors put on the market by Silver & Co., 304 310 Hewes street,

Fig. 2.—Aluminum Shaker, Strainer and Mixer.

nest in a package 3 x 4 inches are adapted to use in traveling and at picnics. The squeezer and shaker in Fig.

is placed. After the juice has been extracted and water and sugar added, an empty glass is placed on the top of the extractor, when the contents may be thoroughly shaken, and the liquid strained off, leaving the seeds and pulp in the strainer. The extractor in Fig. 4 forms both a juice extractor and juice receptacle, complete in one piece. It is 4 Inches in diameter, 2 inches high, and weighs less than 1 ounce. The manufacturers claim for these alumlum extractors that they are practically unbreakable; that there is no danger of

Fig. 4.—Aluminum Cup Juice Extractor.

particles of glass getting into the beverage; that there are no sharp edges to cut the fingers or to do harm; that they are as pure as gold and as strong as steel, and that they are not affected by fruit acids of any kind.

#### Erie Aluminum Hollow Ware.

Griswold Mfg. Company, Erie, Pa., have added to their line of extra finished hollow ware, tea kettles and preserving kettles cast in pure aluminum. The tea kettles are cast all in one piece, having no spout to melt off, no seams to open and no chance for leakage. The manufacturers state that pouring cold water into them when hot will not injure them, that they will not melt on the stove, and that water boils in the aluminum kettle in one-third less time than in tin or copper. The preserving kettle is cast in 4.6 and 8 quart sizes, with a rim on the bottom to equalize the heat and to prevent burning. The manufacturers claim for the kettles that acids will not affect them, that there is no enamel to flake off or plating to wear off, and that oatmeal, rice, puddings, &c., can be cooked in them without scorching. The point is made that the kettles will not tarnish or corrode, and that they are stiff, firm and indestructible.

A bill which has recently been Introduced in the Senate forblds the trans-

3 has perforations around the base of the cone through which the juice runs into the glass upon which the squeezer

portation of certain explosives and combustibles on steamers carrying passengers.

# STOVE TRADE NOTES.

The New England Stove Trade.

The stove trade in New England, llke Brer Rabbit, is "lying low." About all the business there is doing is in ranges, and that is extremely light. Not many traveling salesmen have as vet started out on the fall campaign, but there is a considerable number that keep going the year round, and from these reports are not particularly encouraging, although, as has been the case for some time past, there is a hopeful feeling. Many of the local foundries will be shut down for at least a part of the month of July. It is the custom of manufacturers in this vicinity to run on stock during May and June, as it has been found that stoves can be produced cheaper during these months than at any other period of the year. Artificial light, a considerable item of expense, is not required, and the men are usually in a good physical condition and capable of doing more work than when the lethargy of midsummer is upon them. This year has brought no change in the usual custom, but, after the conservative fashion of the times, manufacturers have been extremely careful in asserting their stocks and in some cases have made up less goods than heretofore.

A number of entirely new stoves have been prepared for the fall trade and many others have been made over by using the old body patterns and adding a new dress to the outside. These, of course, masquerade as new stoves, which in a sense they are. Retailers in the mill towns of Massachusetts and Rhode Island look for improved business after Congress adjourns, but at present their trade is much depressed by the enforced idleness of a large part of the population. Collections are rather slow, if anything a little slower than last month. Credits are being scrutinized even more carefully than heretcfore, and the smaller trade is reported as paying more promptly than the larger. Prices, on the whole, are well maintained.

Furnaces are moving rather slowly, although there seems to be the promise of much building later. There is considerable competition in this line in the vicinity of Boston, which is resulting in some little cutting of prices, although not enough to affect the trade generally.

Gasoline stoves continue to boom and this is about the only department of the trade that shows much signs of life.

The refrigerator business is dull and has not realized the hopes of the trade. One department store in Boston, which at this time last year was selling on an average of 100 refrigerators a week, is now getting rid of but 25. House-keepers have caught the spirit of economy which prevails everywhere and are making their old refrigerators do for another season.

## The Chicago Stove Trade.

Trade in coal goods has taken quite a start within the past two or three Some establishments in fact may now call themselves fairly busy. Still, there are complaints of dullness and lack of orders in some directions. This is especially the case with those who coufine themselves to a limited Special causes dominate trade largely this year, and those who cover the largest area are getting the There are portions of the best results. West which have in the past been heavy purchasers of stoves that are this year not expected to take more than a third of their usual quantity. The extreme Northwest will probably show up badly in the season's footings on account of the very low price of wheat. So will the mining sections in which silver has hitherto been a leading metal. They have not recovered from their depression as yet and will buy very aparingly. Crop prospects are improving throughout the West generally and farmers are getting a little more hopeful of the future and, of course, impart the same feeling to their local merchants.

The trade in oil heaters, which has become such a feature in recent years, promises to be still more so this year. Orders are being received by manufacturers in much greater number than at the corresponding time last year or the previous year. These portable heaters have proved to be so convenient as auxiliaries to other forms of heating that they have apparently opened up a distinct field for themselves.

The strike of railroad men has for the present interfered seriously with the Chicago stove trade by almost totally preventing shipments out of the city. Very few roads have for the past few days received any freight whatever, owing to their utter inability to promise anything like prompt shipment. The magnitude of the strike, however, argues strongly in favor of its early settlement in some fashion.

## The Thomas White Stove Company

of Quincy, Ill., favor us with a copy of the thirty second annual catalogue and price-list which they have just issued, price-list which they have just issued, relating to stoves, ranges and hollow ware. It is printed on a good quality of calendered paper and bound in colored paper covers. The opening pages are devoted to the company's lines of ranges and cook stoves for burning coal. The ranges include the Royal, a subatantial six-hole construction, made in a number of atyles and sizes; the Home Royal, a new six-hole stove made in one size and embodying the latest features of construction and ornamentation; the Royal Herald, also made in one size, and the Prize Royal A. The cook stoves are offered under the names Royal Prize, Royal Gem City and Harmony. Following these are the wood burning constructions, the Royal Gem City and the Royal City ranges and cook atoves. The leading place among the heaters is given to the Royal Princess, to which a new size has recently been added. This stove is of the Todd class, handsomely ornamented, and has proven exceedingly popular with the trade. The Rainbow is another new Todd, made in several sizes, following which we find the Prince Royal base heater; the Ocean Wave box; the Charm Oak surface burning base heater for soft coal; the Charm soft coal base heater; the Royal Oak; the Novelty, Silver, Argus, and a price-list of stove hollow ware.

## German Cooking and Heating Apparatus.

We have at different times in the past called attention to the character of the cooking and heating apparatus generally employed in foreign countries, but the subject always has interest to American readers for the reason, no doubt, that the visitor abroad usually describes what is seen from his or her individual atandpoint. In this way the same topic variously treated is the source of much that is entertaining and instructive. A correspondent of one of the New York daily papers tells in a recent issue about the apartment houses in Berlin, and after describing their general construction and arrangement touches upon the questions of heating and cooking with the appliances necessary therefor. The states that in none of the writer houses is steam heat or hot air furnaces employed. In all the rooms, she says, are large stoves reaching from floor to ceiling, made of colored or white porcelain tiles, with brass or nickel doors and trimmings. Some of them are exceedingly artistic and ornamental, while others are painfully suggestive of a family monument. Briquettes of pressed coal, about 8 inches long, 2 wide and 14 thick, are burned, and the fire must be made every morning. The fire place is very small and is in the lower part of the stove, while the upper part is filled under the tiles with coiled iron plpe. A little paper and a few small dry sticks are laid in the fire place, and from 10 to 20 briquettes placed on top. lighted and allowed to burn with open door until the briquettes are all aglow and just ready to crumble. The doors are then closed and screwed up tight with a key, so that no draft can enter. The tiles soon begin to radiate a gentle heat communicated to them by the coil of iron pipe, which holds the heat for some hours. At no time is the stove so hot but that you can bear your hand on it. These "Berliner ceven," as they are called, are made with fancy mantels on them, which always bear numerous pieces of bric a-brac, and are ornamented with delicate lambrequins and scarfs. The rooms can be kept warm and the heat is a pleasant one, but the floors are generally very cold.

#### Kitchen Stove.

The kitchen stove is a curious structure to American eyes. It also is made of white porcelain tiles, with polished brass doors and trimmings and an iron

top. The ordinary German "koch machine" has only one hole, which is directly over the grate, but this is covered by a series of concentric rings, so that it may be regulated to suit the size of the pot. Directly over the grate and around this hole the stove becomes very hot, but on any other part of the stove dishes may be aet with perfect safety. A mixture of coke and soft coal is burned, and the fire is allowed to go out after each meal, but it is so eas-ily lighted and burns so freely that one can make a fresh fire and have boiling water in 15 or 20 minutes. The baking ovens, two in number, are back of the stove and are heated by a separate fire made directly under them, and made only when necessary. The oven may be made hot in about 20 minutes, but though admirably adapted for meats, the heat from below is so great that puddings and cakes will burn badly on the bottom before they are half baked. The Germans never bake cake and bread as we do. They always buy the latter, and if they occasionally make the former, they

and it out to a baker to be baked; these ovens are, therefore, admirably adapted to the German housekeeping. Americans can also use them, however. By long experience, some American ladies found that a sheet of thick asbestos paper cut to fit the bottom of the oven, and laid in just before setting a cake in, would sufciently reduce the direct heat and so diffuse it that cakes, biscuits and pies could be successfully baked, but bread burned before becoming cooked through. There is a small warming oven in the stove, and the water in the kitchen sinks is heated by it, but the bath water must be heated by a separate fire made under a boiler-like tank in the bathroom.

THE TROY NICKEL WORKS of Troy, N. Y., are distributing a folder which relates to the Alaska stove trimmings, of which they are the manufacturers. The inside pages carry a picture entitled "The Result of the Panic," and the statement that Alaska stove trimmings are on top. Illustrations are given of Alaska goods, together with the warning, "Don't Burn Your Fingers."

#### B. C. Bibb.

The trade of the country will learn with regret that B. C. Bibb, president of the B. C. Bibb Stove Company of Baltimore, Md., died at his home in Baltimore on Saturday, the 23d ult. He was within three months of completing his seventy-ninth year, having been born in September, 1815, at Fredericksburg, Va., where he received his education. When quite a young man he became clerk on one of the steamers plying on the Rappahannock River between Fredericksburg and Baltimore, which position he held for a few years. He afterward obtained a clerkship with the Adams Express Company, that company being then in its infancy, and was associated with the late S. M. Shoemaker, the manager of the Baltimore office. He, however, remained but a short time in this position, leaving it to

B. C. BIBB.

embark in the stove business, and establishing himself with a partner at the corner of Light and Balderston streets in Baltimore, under the firm name of Robins & Bibb. Some years later the firm dissolved and Mr. Bibb continued the business under the style of Bibb & Co. He subsequently took his only son, Bentley, into the business, and the name of the firm became B. C. Bibb & Son, under which name it continued until 1888, when the firm became an incorporated company under the present name of the B. C. Bibb Stove Company.

Since its establishment the business has been conducted in the same premises, although additions and improvements have been made. Until about 1882 the business was for the most part a jobbing business. In that year Mr. Bibb purchased the foundry formerly owned and conducted by Armstrong & Co. in Baltimore and commenced to manufacture stoves. He was one of the original inventors of what was at one time known as the Latrobe stove, but latterly as the Baltimore fire place heater. Considerable and frequent litigation resulted in connection with the

patents covering his designs and inventions; but in all the different suits he met with success. Shortly after the incorporation of the business he lost his son, who had been elected vice-president, and this proved to be a great shock to him. In 1891 he met further trouble in the death of his wife, and these blows no doubt ten led to hasten his end. He was, however, active almost to the last, his death being due to a general debilitation from which he had suffered from the beginning of the year.

He was not identified with any organization political or otherwise, but was a very worthy citizen, a man of the highest integrity and one whose word was ever as good as his bond. He was of a kind and cheerful disposition, very domesticated in his habits and was held in the highest esteem by all who knew him. The likeness presented herewith

The likeness presented herewith is reproduced from a late photograph. He leaves two daughters, wives of A. W. Stehman, the treasurer and manager of the company, and Dr. Walton Saunders of Virginia. The only institution in which Mr. Bibb was prominently interested was the Hopkins Place Savings Bank, Baltimore, of which he was one of the incorporators.

## The Fuller & Warren Company.

We are indebted to the above concern, with main office at Troy, N. Y., and branches in New York, Boston, Buffalo, Chicago and Milwaukee, for a copy of a special illustrated catalogue of ranges, cook stoves and heaters, which are presented in extensive and varied assortment. The volume is made up of nearly 130 pages, among the first of which we find a telegraphic code with directions for using it, prices, terms, &c. The company's line of wrought steel oven ranges is first considered, this stove embodying the modern features and is offered in a

embodying the modern features and is offered in a variety of styles and sizes. It is made both portable form and brick set. Following it are wrought ateel broilers made of heavy wrought steel, with all exposed parts thoroughly protected. The P. P. Stewart range is next in order, the atatement being made that over 2,000,-000 of Stewart stoves have been made and sold. The F. & W. Co. range occupies several pages, as does also the Eastern Stewart, a recent addition to the company's assortment and made for burning hard or soft coal or wood. Nearly 50 pages of the catalogue are devoted to ranges, which include besides those already mentioned the Germania, the Diamond Signal, Diamond Advance, Rescue and Clinton.
These are all fitted with the company's patent oval fire box and triple interchanging grates with new basket wood The cook stoves occupy several pages, these in turn being followed by the company's line of heaters, which comprise the Splendid, the Square Splendid, the Splendid Stewart and the Art Splendid self feeding base burners for hard coal; the Matchless Diamond, a low priced self feeding base burner; the Stewart Square, the Stewart Round

and the Stewart Oral hard coal surface burners, made in single or double sections, with certain sizes arranged as double heaters; the Stewart Air Tight, a new construction of elaborate design and ornamentation intended for burning soft coal, coke or lignite; the Stewart Oak, Junior Oak and Putnam Oak, together with a large assortment of wood burning constructions, consisting of the Stewart, Cottage Diamond, Triumph, Onward and Trojan. There are also shown Franklin stoves, fire place heaters, cylinder, globe, laundry and tailor stoves. An extensive price list, directions for ordering repairs and a comprehensive index are features of the closing pages.

### The Electric Oil Stove Company

of Homer, Mich., have issued a handsome 48-page catalogue of their specialties, bound in an embossed paper cover. As a frontispiece a fine portrait is given of B. F. Goodrich. Theu comes a view of the company's works and othices, followed by a map of Michigan, showing the location of Homer and its superior shipping facilities. After a few pages of general information the No. 30 Electrie oil heater is illustrated and very theroughly described. The No. 22 heater is next taken up, followed by the No. 15, the No. 35 and the No. 5. In each case the details of construction and operation are more than usually full, but in order to still more clearly explain their special features a sectional view is given showing the principles of hot air circulation, radiation and water evaporation involved in the construction of all the Electric stoves. The fount and the burner are likewise illustrated and described. Cuts are also presented of heaters with their radiating drums removed and replaced by extension tops for cooking. A section of the catalogue is devoted to oil ranges and cooking stoves. The ranges shown comprise the No. 12 four-burner Electric, the No. 120 four-burner, the No. 121 four-burner, the No. 121 four-burner, with elevated shelf and oven, the No. 40 two-burner, the No. 4 two burner and the No. 8 two burner. The cook atoves are the No. 6 oneburner, the No. 1 lamp stove and the No. 2 double burner lamp stove. The variety thus presented covers every requirement in the oil heating and cooking line. The contents close with the illustrations of different styles of ovena, adapted to the several stoves and ranges.

## ODD PLATES.

THE SITUATION in regard to the consolldation of the interests of some of the leading vapor and gas stove manufacturers remains without important change from our latest published reports. Progress is being made looking to the end sought and it is confidently expected that on the date specified the formal transfer will be made to the United Vapor & Gas Stove Company.

S. B. Sexton & Son, Baltimore, Md., have placed on the market this season Sexton's improved low down radiating furnace, made in four sizes portable form and three sizes brick set. It has been designed to meet the demand for a furnace suitable for low cellars without a furnace pit, and also to give more room for the elevation of the hot air pipes. Combustion of gas and smoke products is obtained at the points entering the side radiator, where there is a commingling of the unconsumed products, the heat of which expands and fills the lower radiator, extracting and

radiating the heat before reaching the smoke pipe. It has a heavy cast iron dome, made in one piece and gas tight. The radiators are of ample size and so arranged as to allow a sufficient space between them and the fire pot for the passage of cold air. This is a leading feature of the furnaces and, it is claimed, one particularly illustrated in the lower radiator, the bottom of which, being placed about on a level with the grate bed, acts as a trench plate and equally distributes the cold air. The cylinder and side and back radiating tubes are made of heavy rolled steel, while the lower radiator is of cast iron, and has a clean out door in the rear outside of the casing. The feed door is lined with an inside per-forated plate, whereby the door is protected and the gas burned by the admission of air. The furnace has a large water pan projecting in front, a deep and roomy ash pan and a prismatic grate. The radiators and flues being large admit, it is clalmed, of the suc-cessful burning of aoft coal. The firm are also introducing the improved New Baltimore range, with horizontal boller and hot air attachment, the latest addi-tion to their New Baltimore line. This is a six-hole range, having flue construction for applying heat to each hole simultaneously, reversible hot air collar and pipe on top of range, and cold air grating on each side of base. boiler is supported by open ornamental brackets, and is constructed to stand high pressure. The range is made in two sizes and four styles, with either right or left hand fire boxes, and with or without warming closeta. is also made to suit a vertical boiler.

THE DANVILLE STOVE WORKS of Danville, Pa., announce for the fall season of 1894 four new lines of parlor stoves and a new range, which is offered the trade under the name Beaver. These goods are first class in all particulars and are claimed to possess selling qualities which place them in the front rank of standard goods. The company state that their representative will call on the trade in due season. The New York office of the company is at 282–286 Pearl street, and is under the able management of A. L. Canfield.

An ARDENT ADMIRER of the Jewel atoves thus grandiloquently speaks of their wide apread popularity: "From roaring London northward to the Cheviot Hills, in the craggy land of the heather and the harebell, in the green island where the shamrock grows, in the provinces through which, in vinectad valleys, the castled Rhine wanders, in gay and prosperous France, in the Dutch countries by the Zuyder Zee, in the land of the Sultan, by Danube's dark stream, in the sad empire of the Czar, in the shadowa of the Carpathiana, among the hills and mountains through which the blue Guadalquiver pursues its devious way, in the enterprising metropolis by which the Rio de la Plata rolls its broad flood seaward, in the antipodal cities of the Australasian world, in the lovely r.a'm of the Mikado, in every section of our own glorious Yankceland, in short, in whatsoever civilized countries the modern globe trotter journeys there will he find Jewel atoves and ranges, and he finally learns to accept the presence of Jewels in any country as a aort of sign of that country's intellectual advancement."

Chas, Noble & Co. of Philadelphia, Pa., are working on several new articles for the coming season. Among those already on the market are the

Liberty steel range in 17 sizes, with 4 to 12 holes and with and without hot closets; the Hustler, a five-hole range, with open end, nickeled name plate and double tiles; the Mascotte, a five-hole range, with plain end, nickeled name plate and double tiles, and the Corker, a plain end five hole range. The five hole ranges are introduced in response to a demand for a cheap and serviceable range. They have also placed on the market the Acme, a sheet iron base burning heating stove, of low price, with and without nickeled ralls and nickel urn.

THE PAPER READ by Joseph Leon Gobeille before the National Association of Stove Manufacturers at their last meeting in Chicago has been brought out in pamphlet form with all the neatness and eccentricity that might be looked for in a publication of Mr. Gobeille's. The front cover carries a musical and chromatic scale under the title. The pamphlet is "Imprinted at Detrolt," the address was "Spoken in Chicago" and at the end is an "Afterword." The latter informs us that there have been "Ten tallish copies printed." The trade will be interested in getting copies of this characteristic monograph. We understand from the Gobeille Pattern Company of Cleveland, Ohio, that they are very busy, running over 100 men on patterns, and they give the hopeful news that business acems to be picking up a little.

THE FIRE which damaged the foundry of Bridgetord & Co., at Louisville, Ky., a short time ago is thus briefly deacribed by a local paper: "The fire originated in the central part of the building, near the cupola, and probably ignited from it. The firemen experienced considerable difficulty in reaching the center of the building, and the flamea apread rapidly through the molding shed into the pattern shop, where thou-sands of valuable patterns were stored. These were soon consumed and were nearly a total loss. Those not destroyed by fire were ruined by water. In the third story of the building were hundreds of finished stoves, ready for the market. The floor supporting them was burned away, and they fell with a crash to the ground beneath. Many were broken and the loss will be considerable from them. After three hours of stubborn fighting the fire was extinguished. The insurance is placed entirely with New York companies and will fully cover the loss. The damaged part of the foundry will at once be rebuilt, but the loss of the patterns may delay the work in the foundry until they can be replaced."

Joseph Leon Gobelle of the Gobeille Pattern Company, Cleveland, Ohio, sailed for Europe on the "Normannia" on last Thursday. He proposes to attend the meeting of the dealgners of ornamental metal, marble and wood work, at Lyons, where he will look into the finer methods of casting, such as the reproduction of lace, &c. With Mr. Gobeille's well-known interest in the artistic side of his work there is no doubt but the trade will ultimately get much benefit from all that he learns abroad.

Walters, Walker & Co. of 106 Market street, Pittaburgh, Pa., issue a neat advertising card, upon one side of which is the following inscription: "If you use a Bellwood range you will have no trouble with baking or cooking." On the other side it reads, "Please do not tell me your troubles, as I have troubles of my own. Your troubles

will be lessened if you use a Bellwood range."

THE DETROIT STOVE WORKS of Detroit, Mich., are the latest addition to the ranks of gas stove makers. They have just completed one size of what is known as the Faultless Jewel gas range, for which strong claims are made.

GEO. D. HOFFMAN, 82 Lake street, Chicago, has been appointed general Western manager for the Craig-Reynolds Foundry Company of Dayton, Ohio. He will control the States of Indiana, Illinois, Kentucky, Missouri, Kansas, Nebraska, Iowa, Wisconsin, Minnesota and the Dakotas. The Hoffman-Russell Company will handle the agency for Chicago and Cook County. In addition to the Triumph warm air furnace the company have agreed to enter into the manufacture of furnaces of special designs to meet the views of Mr. Hoffman. Catalogues descriptive of the new furnaces, which will embody important features in furnace construction, will be ready about the 15th inst.

THE A. C. BARLER MFG. COMPANY, 113 Lake street, Chicago, will continue to manufacture their Ideal No. 12 oil heater, which has been made for the past three seasons with great success, introducing some new features which they believe will make it still more popular. They have added two smaller sizes for this year's trade, named Ideal No. 6 and Radiant No. 5. The No. 6 possesses all the features of first-class construction and is offered at a moderate price. While the No. 5 is the same in general construction, it is finished only in part nickel so as to make it still cheaper. These two new heaters are constructed on a novel method of circulating air, in addition to heating by radiation, on which application for patent has been made. The company report the fall trade opening up well, with orders coming in from numbers of new customers.

THE CHICAGO STOVE & RANGE COM-PANY, whose quarters at 45 and 47 Lake street were recently burned, have removed their office temporarily to 41 State street, with the Abram Cox Stove Company.

RATHBONE, SARD & Co. sing the praises of Autora, Ill. It is the ideal stove manufacturing town. The stoves almost grow there. It is not afflicted by droughts, famine, lack of business or strikes. The Chicago stove houses may suffer on account of the great railroad strike which stops their traffic, but shipments from Aurora go forth with the regularity of the solar system and the persistency of the tides.

ADAM REED, Buffalo, N. Y., reports a lively demand for Reed's Combination bake oven, due to the opening of the summer resorts throughout the country. With this oven pastry, bread and meats of all kinds can be baked in large quantities with a saving in both time and fuel.

A. T. Nye & Son of Marietta, Ohio, have made several additions to their already extensive assortment of stoves, brief reference to which may prove interesting to the trade. They have added to their well known line of Popular wood cooks three sizes having ovens ranging from 16 x 18 to 22 x 24 inches in size. They have also added to the five larger sizes of these goods end shelves, oven door openers and outside oven shelves. The manufacturers state that the demand for this stove last year

exceeded their expectations, and they have found it necessary to provide increased facilities for a larger output. The goods are referred to as being made of first-class material by first-class workmen, the design modern and attractive, and the stove as meeting with a good demand.

BUTLER & JOHNSON, Syracuse, N. Y., state that they have sold eight carloads of the Splendid oil cook stoves made by the Novelty Mfg. Company, Jackson, Mich. This stove is provided with circular central draft burners, the oil being fed to the wicks as consumed from a horizontal tank placed behind the burners. It is claimed that in a test only one and one-half minutes more were required in boiling 1 gallon of water on one of these oil stoves than for performing the same operation on a gas burning This, it is claimed, indiconstruction. cates a more intense heat than has prevlously been secured from devices of this character. Another feature which renders this stove popular with the trade is its safety in use.

THE STANDARD GAS BURNER COMPANY, Buffalo, N. Y., make a large line of heating stoves, cook stoves and also burners for furnaces. The cook stove burners are arranged to provide a circular flame under each of the cooking holes, and a long narrow sheet of flame to play directly up against the water back. The furnace burners are made from 12 to 24 inches in diameter and in two, three and four sections, so that a portion or the entire burner may be used, as desired.

The Syracuse Stove Works, Syracuse, N. Y., closed down their plant for a short period, and during the shut down improved the opportunity to install automatic sprinkling apparatus in all their buildings. They have also built a pumping engine house and have connected a 500-gallon pumping engine with both the city water mains and the canal running by their plant. They are thus well provided with water in case of fire. One of their latest productions is the Welcome double oven range, designed for use in large cities and possessing a number of special features.

The Kelsey Furnace Company, Syracuse, N. Y., report that the Kelsey furnace is increasing in popularity with the trade. They have recently established agencies in Washington, D. C., with A. S. Johnson; with L. V. Sanford, 587 Fulton street, Brooklyn, N. Y., and at 113 Beekman street, New York. They have just put into the sand a set of patterns for a new size of their furnace, having a 21-inch fire pot.

The Furnace Regulating Company, 49 West Chippewa street, Buffalo, N. Y., make a specialty of the Waldurff chronometric adjuster for use in connection with gas for heating and cooking. By means of the clockwork the kitchen fire can be lighted at any time to which the adjuster is set.

THE PENNSYLVANIA GAS FURNACE COMPANY, 71 West Chippews street, Buffalo, N. Y., are erecting a manufacturing plant at Seneca and Imson streets. This will be a large two-story building and entirely devoted to the manufacture of their specialties, as they have large warehouse facilities close at hand. Their furnace is constructed entirely of sheet steel, and those heaters having passed through one winter's use are said to show so little wear that no difficulty is expected from rusting out. The method of burning gas in this fur-

nace is somewhat different from the plan followed in the ordinary gas burning furnace and is claimed to result in great economy. They report the placing of orders with them for the fall.

THE BOYNTON FURNACE COMPANY of 207-209 Water street, New York and 195-197 Lake street, Chicago, Ill., have issued a Western edition of their catslogue of furnaces and heaters embodying the modern features. It is a pamphlet of over 20 pages of letterpress, profusely illustrated and containing much that is of interest and value to dealers generally, and particularly to those handling the company's goods. Several new constructions have been added to the manufacturers' assortment, among which may be mentioned Boynton's afect dome re turn flue furnace for hard or soft coal, and Boynton's steel dome return flue furnace with water heating combination, made in four sizes portable form and three sizes for brick work. Iflustrations of other goods include Bovnton's New Crussder, Boynton's New Gas Tight, and Boynton's Niagara furnaces, accompanied by a table showing the comparative and approximate heating capacity of the aeveral varieties made. We also find illustrations of Boynton's fire place heaters, the Newport, Danube and New Lakewood ranges and also of Boynton's Niagara water heater.

THE DETROIT STOVE WORKS, Detroit, Mich., received on July 2 an order for 62 stoves embracing a complete assortment of the Jewel line, being a total of 14 styles of ranges and heating stoves. The order is for shipment to Constantinople.

Press reports from Louisville, Ky., are to the effect that on the night of July 2 the four-story brick warehouse of Stratton & Terstegge, at the corner of Bank and Duncan streets, was gutted by fire. The building was stocked with stores and tinners' supplies. The loss was largely covered by insurance.

The Cleveland Co operative Stove Company of Cleveland, Ohio, announce that they have secured the services of A. E. Wells as sales manager for the States of Indiana and Iillnois. Mr. Wells was with the company for ten years as manager of their indianapolis branch, and is favorably known to the trade through his fifteen years' connection with them. The company have this season added to their already extensive assortment many new stoves, and will carry at Indianapolis s atock of certain lines for the purpose of supplying that city and surrounding country.

## The Gas Stove Question Abroad.

At the annual meeting of the Incorporated (as Institute recently held in London, the president offered some remarks on the subject of gas atoves which may prove interesting to American readers. Among other things he said:

If our many and great undertakings are to increase their usefulness and commercial prosperity, it is of paramount importance that both companies and corporations should take a deep interest in all the departments of their respective undertakings—from the making of the gas on the works to the lighting, heating, cooking, motive power, and all other purposes for which it is required—and that they should be in a position to advise their customers as to the most econom-

leal and scientific way of utilizing gas It is admitted that as for all purposes. this idea is carried out throughout the country, as is already being done with considerable success by many gas undertakings, you will have some special trades trying to make out that you are interfering with their business. There is, in fact, already an effort being made by a large section of very respectable fronmengers, who are deavoring to form themselves into an association for the purpose of trying to persuade gas companies that it would be to their advantage to hand over entirely to them their business of selling gas fittings and letting out stoves, &c. My advice to the gas industry is. Do not accept their suggestions; and I certainly think that It is very courageous of them to enter upon your preserves, and at the same time to ask you to give your birthright. You might just tell these gentlemen that in many places, especially in London, they had the trade in their own hands for years, and made very little use of it. It was proved they were unable to meet the want of the age, hence the gas companies were themselves forced to look after their own and their customers' interests, and increase the consumption of gas by every means at their disposal, and at the same time to satisfy the longing desire of their customers, who undoubtedly should be the first to receive their special consideration. The consumers have certainly shown by their adaptations of the means offered that the privilege of cooking and heating by gas, after being put before them in a practical manner by gas companies, has been accepted in a most remarkable manner throughout the country. Many of the most important ironmongers are pushing the sale of commodities which are in direct opposition to the interests of the gas industry; therefore it would certainly be unadvisable to leave entirely in their hands the sale of articles which are so hands the sale of articles which are so vitally important to its welfare. The question arises, Would the 95,000 stoves, in London alone, hired out by the Gas Light & Coke Company and the South Metropolitan Gas Company, have been in use at the present time if the companies had not moved in the matter themselves? It so happens that I have a knowledge, from practical experience, of this question; and I maintain that to gas engineers belong, as ploneers, the designing, the making, and the introduction of appliances for cooking and heating by gas, and that the 'trade,' as they now style themselves, did not commence their manufacture and sale until a more recent period. The late Mr. Sharp, South-ampton, was one of the leading men who gave displays and lectures at the old Polytechnic Institution and other places about 50 years ago. Then, again, Mr. Goddard, Ipswich, in very early days both sold and let out on hire gas fittings and gas stoves; and you will find that one of the first papers read by this gentleman before the British Association of Gas Managers was as to the advantages of gas for heating purposes. When I was articled to the gas engineer at Northampton, about 40 years ago, the company at that time possessed large showrooms, containing cooking appliances and gas fittings of all kinds, and employed a large staff of fitters, who did all the work in the town. At that period the making of gas cooking and heating appliances of all descriptions had already been in operation for many years; and all of them were sold to customers in the ordinary way of business at a fair profit. This depart-

ment was kept separate and distinct. I have always refrained from going into severe competition with the trade; but I have endeavored to sell them as cheaply as possible fittings and other things they did not possess, so that they could make a profit for themselves. Our chief and primary duty is to set an example by putting in pipes of the proper size, and introducing the best kinds of burners for the economical consumption of gas. A gas company do not care for whole of the business, but only so much as will enable them to protect and further their own interests. My opinion is that If the public knew of the many advantages possessed by cooking stoves, there would be very few houses without them. The further questions of the letting out of cooking atoves on hire, and of their being remunerative in themselves, are very debatable ones. After very considerable experience, my opinion is that the best plan is to sell the stoves out and out to the consumers; but, failing this, to let them out with the option of purchase, upon the three or four years' hire purchase system, which works to the advantage of both the company and the consumer. A large number of instances might be cited where the best burners and proper appliances for cooking and heating by gas would not have been Introduced if the gas engineers and their assistants had not personally persisted in upsetting prejudices and in pointing out the many advantages they possessed.

#### OBITUARY.

SAMUEL B. VAN DUSEN.

Samuel Bonnell Van Dusen, one of the senior partners of the well-known tin plate and metal firm of Dickerson, Van Dusen & Co. of 29 Cliff street, New York City, died at his city home, 61 West Thirty-sixth street, on Monday, July 2, aged 76 years. Mr. Van Dusen's health had been failing for some considerable time, owing to kidney trouble and a complication of diseases incident to old age. The loss of his wife, to whom he was devotedly attached, about two years ago, after a union of nearly half a century, affected him deeply and appears to have undermined his vitality.

mined his vitality.

Samuel B. Van Dusen was born in March, 1818, in Philadelphis, where his father was one of the pioneer Amerlcan shipbuilders. After being educated in the Philadelphia public schools he began his commercial career in a subordinate place in the straw goods business in his native city. While a young man he joined his brother in the coal business in Philadelphia, under the style of Van Dusen. Brother & Co. The firm were extensive operators, and in 1861 Mr. Van Dusen came to this city and opened a branch office in Trinity Buildings, 110 Broadway. 1875 he retired from active business, having smassed a large fortune. In July, 1876, when John S. Dickerson & Co., the metal merchants of 29 Cliff street, reorganized as Dickerson, Van Dusen & Co., he became a partner with Mr. Dickerson and his son Frank, who are still members of the firm. Mr. Van Dusen remained actively connected with it until about six months ago when infirmity compelled him to relinquish his work. He married Sarah Grace Dickerson, a sister of the senior partner of the original firm. They had ten children, of whom five survive-namely, one son, S. Clinton Van Dusen, a partner in Dickerson, Van Dusen & Co., and four married daughters. Mr. Van Dusen was highly esteemed in the

metal trade and in business circles at large as a man of strict integrity and benevolent qualities. By his employees he was beloved.

He was for many years a director of the Greenwich Savings Bank, the New York Eye and Ear Infirmary, and the Colored Orphan Asylum, and was a public school trustee in the Twentieth Ward, from which latter place he retired some 12 or 15 years ago. He was an ardent Abolitionist before and throughout the Rebellion, and his interest in the colored race remained intense throughout his life. His support of religious and benevolent objects was wide. He was large hearted in charity, firm in friendship and devout in religion. Mr. Van Dusen was a deacon of the Madison Avenue Baptist Church at the time of his death. His funeral took place at his home on Thursday morning, July 5, the interment being made in the family plot in Greenwood Cemeterv.

#### BENJAMIN DOUGLAS.

Benjamin Douglas died on Tuesday night, June 26, 1894, at Middletown, Conn. Mr. Douglas was born at Northford, Conn., April 3, 1816, of Scotch sncestry. He acquired the rudiments of his education by a few months' attendance at the district school during the winter while a lad and by extensive reading since then. When 16 years of age, in 1832, he came to Middletown and apprenticed himself to a machinist. In 1839 he joined his brother William, who in 1832 had with W. H. Guild established a machine shop. For three years they carried on the business of an ordinary foundry and machine shop, manufacturing hydraulic rams and pumps. From the invention in 1842 of the celebrated revolving stand pump the success of this firm was established. Year after year the Year after year the business increased until the name of W. & B. Douglas was known the whole world over. They have an extensive trade throughout the world. William Douglas died April 21, 1858. He was Mayor of Middletown from 1849 to 1855, a member of the General Assembly in 1854, a Presidential elector in 1860, and Lieutenant Governor in 1861. Mr. Douglas was a director in the Middletown Gas Company and the Air Line Railroad, and a director and large stockholder in the People's Fire Insurance Company. He was the first president of the First National Bank and continued to hold that office until Hon. John N. Camp was elected, and then he remained as a director until the present time. He was also for years president of the Farmers and Mechanics' Savings

THE CATALOGUE of Brown & Wales. 69-83 Purchase street, Boston, Mass., is a serviceable and comprehensive publication of nearly 300 pages. It is bound in linen backed paper covers, carrying the name of the firm with the word "Metals" and a back title of "Heavy Hardware." It is impossible to give a list of all the articles or even classes of articles enumerated, but a brief summary of what the firm deal in will suffice to indicate what lines of goods are embraced in the catalogue. Iron and Steel, Heavy Hardware, Tin Plate, Sheet Iron Tank Plates, Angles, Tees, Blacksmiths', Machinists' and Tinners Supplies, Corrugated Iron, Steel Roofing, Sheet Brass and Copper, Brass and Copper Tubing, Sheet Zinc, Solder, Babbitt Metals, &c. The volume is very thoroughly Illustrated, contains full price-lists and table of sizes and other essential information.

# TRADE REPORT.

## The Iron Market.

The current requirements of the country continue abnormally low. The markets in raw materials and finished products along the whole line are exceedingly dull, and there is very little business in sight. If continued, the railroad strike would cause some embarrassment to a wide territory by making it difficult for manufacturers to obtain supplies of raw material and to ship product promptly.

While the recording of cheerful news is the most pleasant task which falls to the lot of the journalist, he must not shirk from the duty of truthfully describing the situation, though it be

painful.

The hope had been expressed in the past that a revival of business would acon follow the adjournment of Congress, never mind what that body did finally do with the tariff. In the Iron trade the opinion is still quite universal that our legislators must go home before any improvement whatever can be expected. But the hopes of a prompt recovery are now much less than they were, and at the best a very gradual bettering of business is looked forward to, in spite of low stocks in every branch of the trade.

Pig Iron.—The New York market continues very quiet and is steady, some of the Southern producers having practically withdrawn. We quote standard brands \$12.50 @ \$13 for No. 1; \$11.25 @ \$12 for No. 2, at tidewater. Southern Iron, same delivery, \$11.50 @ \$12.25 for No. 1; \$10.50 @ \$11 for No. 2; \$10 @ \$10.25 for No. 3; \$10.25 @ \$10.75 for No. 2 Soft, and \$10.50 @ \$11 for No. 1 Soft. Foundry Nc.4 (Foundry Forge) is \$9.75 @ \$10.25

Another very active week is reported in local Coke Iton in the Chiesgo market. The volume of business was fully as large as that of the previous week. The month of June closed with a good record, being the heaviest in sales for a long time. Much trouble, however, is now experienced in making shipments to consumers Some representatives of Southern concerns are not making any quotations whatever, as their principals have no Iron to offer. Lake Superior Charcoal continues quiet, and while some of the leading companies firmly maintain prices others are offering strong inducements to consumers. Quotations are given as follows for cash:

Lake Superior Charcoal	\$15.00 @	\$15.50
Local Coke Foundry, No. 1	11.25 @	-11.50
Local Coke Foundry, No. 2	10.50 @	11.00
Local Coke Foundry, No. 3	10.00 @	10.50
Local Scotch	11.50 @	-11.75
Ohio Strong Softeners No. 1	13.00 @	13.50
Southern Silvery, No. 1	@	
Southern Silvery, No. 2	®	
Southern Coke, No. 2	10.50 @	10.75
Southern Coke, No. 3	10,25 @	10,50
Southern, No. 1, Soft	10.50 @	10.75
Southern, No. 2, Soft	10.25 @	10,50
Tennessee Charcoal, No. 1	@	
Tennessee Charcoal, No. 2	@	11111
Alabama Car Wheel	17.50 Ø	18.00
Jackson County Silvery	15.00 @	16,00

Temporarily there is nothing whatever doing in the Philadelphia Pig Iron market, although the situation has improved to the extent that atocks are held at rather higher figures, owing more to decreased stocks and decreasing production than to any actual im-

provement in demand. Current quotations for Philadelphia and near by points are \$11.50 @ \$12 for No. 2X, and \$12.50 @ \$13 for No. 1X, which average about \$1 less than were quoted six months ago, and are possibly 25¢@ 50¢ better than were ruling three months ago.

There has been a light trade in Pig Iron in the Cincinnati market during the week. There was only a jobbing demand in this district, mainly for single car lots. The resumption of Coal mining has not yet materially increased the production of Pig Iron, and the market is still laboring under the disadvantage of a scarcity of iron, but no one is disposed to pay an advance, as they would have to do to buy any considerable quantity. Some of the Southern furnaces have withdrawn entirely from the market, and say they will not sell until prices advance to a remunerative basia. While prices are not quotably higher, a strong and confident undertone prevails. Quotations are as follows:

Southern Coke, No. 1	\$10,25	@ \$10.10
Southern Coke, No. 2	9.50	@ 9.75
Southern Coke, No. 3	9,25	
Ohio Soft Stone Coal, No. 1	14.50	
Ohio Soft Stone Coal, No. 2	14.00	
Lake Superior Coke, No. 1	12.50	
Lake Superior Coke, No. 2	11.50	@ 12.00
Hanging Rock Charcoal, No. 1	17,00	@ 17.50
Hanging Rock Charcoal, No. 2		@ 17.00
Tennessee Charcoal, No. 1	. 13.00	@ 13.50
Tennessee Charcoai, No. 2	12,00	@ 12.50
Standard Southorn Car Wheel	16.25	@ 17.00
Lake Superior Car Wheel and		•
Mellochie	16.25	@ 16.75

Advices from Louisville, Ky., state the demand in that district continues light on the part of most Iron consumers. Stove companies are almost all shut down, with little work; car companies are either closed entirely or running on small orders; Pipe shops report good business, but prices yet show no improvement with them. Quotations, for cash, f.o.b. cars, Louisville:

### Metal Market.

Plg Tin.—The market has been dull and narrow. Purchases have been on strictly conservative lines, and prices have remained practically unchanged. Jobbers' rates for small lots of Straits Pig from store rule at 20½ @ 21¢ per lb. The visible supply is much above the average for this time of the year. American holdings and stock afloat are estimated at 19,500 tons, being 450 tons more than was recorded on June 1, which would appear to strengthen the popular belief that there is enough Tin in sight to go round.

Copper.—There has been no improvement in home trade or export demand.

Only small orders and comparatively few of those have been placed here. In short, the market has remained positively dull. While wholesale prices have been variable and tending to weakness, retail rates for moderate quantities for spot delivery have held their own at 10½6 ?? It for Lake Superior lugot, with the usual decrease in price for the cheaper varieties. Manufactured Copper has fared no better, orders and inquiries being on a very restricted scale.

Pig Lead.—The market is without quotable change, although the fact that late purchases had cleared up spot stocks and left very little for smelters to send forward during the balance of the month has contributed a firmer feeling to prices, which have shown a rising disposition. This has not affected jobbers' prices for moderate lots of the metal, common Domestic Pig still ranging between 3½¢ and 37½¢ lb, with plenty offering. Forward shipments are, however, at some discount. The stiff prices paid for prompt shipments, in view of the prospective difficulty in obtaining shipments from the West, indicate a positive need of stock.

Spelter.—Buying has been slow in this quarter and inquiries have not increased in any remarkable degree. Orders have gone out from other quarters in sufficient number to have a perceptible effect upon the primary markets and this, in turn, makes it difficult to secure stock for delivery at New York or common point at prices that were common a short time ago. The labor troublea, as affecting transportation of the metal, are likely to induce a further advance, unless the impediments are speedily removed. The demand from galvanizing works is fair, but recent strikes have caused a scarcity of fuel, resulting in the enforced closing down of a number of plants. Weatern Spelter is quoted by retailers at \$4\psi\$ for moderate quantities.

Antimony. — The market has been quiet and prices are easy. For small parcela jobbers' prices are about 10% for Cookson's and 10% for Hallett's.

Nickel.—Quotations range from 43¢ to 50¢, according to delivery and size of lot.

Plates.—Even for a holiday week, the market has been very poor indeed. Dealers complain of extraordinary apathy on the part of consumers in regard to both spot and forward deliveries. Spot business is purely of a hand-to-mouth nature, and orders since the 1st of the month have been almost exclusively for small parcels for immediste use. Supplies here are only fair and the assortment is somewhat broken, but that fact is offset by heavy stocks on the other side, ready for shipment to this country at short notice. The quantity at Swansea is reported as being over 300,000 boxes. Prices here show no improvement, although they are rather higher in England. This market is uncertain largely on account of pending tariff legislation and the peculiar circumstances of the time, and its tone diaplays some weakness, although prices are nominally unchanged.

A special London cable dispatch to The Iron Age of July 3 reports as follows in regard to the British Tin Plate trade: Tin Plate has undergone no decided change. The demand is chichly for small or retail tots. Generally prices are maintained, but some sellers are cutting slightly. The majority are booked ahead and prefer to wait. There is more inquiry for light weight Cokes than for other sorts. Swansea prices are as follows:

Bessemer Cokes, 14 x 20	60	10.3
Stemens Cokes, 14 x 20	66	10 6
Ternes, double box	60	19
Charcoals 13	60	15,

Sheet Iron.-Restriction of production by the closing down of a number of mills on account of wage disputes, fuel scarcity, &c., has had the effect of strengthening prices on Sheet Iron to some extent. While the demand for ordinary Black Sheets is moderate in this section, prices show more firmness. Galvanized Sheets, on the other hand, are in good demand, and manufacturers are not disposed to book orders for forward delivery. While jobbers' discount on moderate quantities from store is still quoted at 75 % @ 75 and 5 % off, the tendency is generally toward asking the higher price, and this appears to have been readily paid of late. Black Sheets of light gauge for tinning are very active, with the supply hardly adequate to the demand.

## Chicago Report.

Scrap.—Dealers continue to quote the following list of buying prices, Chicago delivery:

Per	net ton.	Per lb

#### CONDITION OF THE

## Hardware Trade.

THE PRESENT WEEK, broken as it is by a national holiday and at the commencement of the summer dullness, finds trade reduced to a minimum. A feature of special importance at this time is the great railroad strike, which, besides interfering with current business, is assuming ominous propor-tions and has a disquieting effect on the public mind. There is little new to report in the Hardware market, manufacturers and jobbers as a rule having withdrawn their travelers and are giving little attention to the active prosecution of business. Many of the mills and factories are reducing their production or shutting down entirely for a few weeks in order to enable them to make the necessary repairs and improvements so as to be in efficient condition for future operations. In the matter of prices the market continues as for some time, nearly all goods being offered at very low figures, from which there is yet no recovery. There is. there is yet no recovery. There is, however, a disposition on the part of manufacturers to be conservative in the matter of prices and to refuse to sell goods at unremunerative figures.
The experience of the past year has led prudent manufacturers and merchants to give very careful attention to the manner in which they are conducting their business, scrutinizing costs closely and reducing expenses wherever possible. A further effect of this will probably be found in a more con-servative and careful policy than has characterized the operations of many characterized the operations of many of them in the past, and in this way it is not unlikely that good effect from the peculiarly trying year that has passed wilt be found in trade circles for some time to come. There is a general feeling that while trade for a form weeks will probably be enjoy fell. few weeks will probably be quiet, fall business will be at least fair, and there are some careful observers who are are some careful observers who are anticipating a large demand and a speedy return to normal conditions. Reports in regard to crops are for the most part exceptionally favorable, and there is little general complete in

there is little general complaint in regard to collections.

Advices from Chicago.—Owing to the railroad strike the treight officials are now notifying merchants that they will not receive freight until further notice. This causes some inconvenience, but not so much as it would if trade was active. Business in Shelf Hardware has fallen off considerably during the week. Salesmen are being advised to take their vacations now, and a broad hint is given that they need be in no special hurry to report for resumption of work. Orders are light in every department, but staple goods are decidedly neglected. The Heavy Hardware jobbers are in better shape, having a good steady demand for Iron and Steel. Carriage and Wagon Stock, Blacksmiths' Supplies,

## Notes on Prices.

Wire Nails.—The volume of business, as is to be expected at this season, is small and the mills are all of them either diminishing their output or shutting down altogether for a few weeks. Notwithstanding the limited demand the price is firm, and mannfacturers who a short time ago were quoting \$1.05 for carload lots at mill have withdrawn this figure and the market is now represented by the quotation of \$1.10, which is firmly adhered to. Small lots from store in New York are held at \$1.25 to \$1.30.

Advices from Chicago. — Very little is doing by either manufacturers or job.

bers. Prices from factory are maintained at \$1.20 to \$1.25, Chicago. Jobbers quote \$1.25 on small lots from steck.

Cut Nails. — There has been little change in the Cut Nail market during the past week. The quantities are small, but the mills have no large accumulations of stock on hand. The price for carload lots delivered on dock in New York continues at 95 cents to \$1, the former figure being in most cases readily obtainable. Small lots from store in New York are held at \$1.10 to \$1.15.

Advices from Chicago.—Trade is light and factory prices are unchanged at 95 cents, Chicago, on 55-cent average. Jobbers sell small lots from stock at \$1.15.

Barb Wire.—There is little doing, and prices remain without change, being somewhat uneven, but manufacturers are not attempting to force sales. The market is represented by the following quotations for Four-Point Galvanized, delivered at the points named: Pittsburgh, \$2.05 to \$2.10; Cleveland, \$2.10 to \$2.15; Cincinnati or Allentown, \$2.25 to \$2.30; Chicago or New York, \$2.25 to \$2.30.

Advices from Chicago.—The movement is very light at present, but manufacturers seem to be making no effort to push sales. Jobbers quote small lots of Galvanized at \$2.35 to \$2.40, with 10 cents off for carloads.

Cordage. — The manufacturers of Cordage have made another advance and are now quoting as follows:

Base. Cents.
Manila 734
Sisal 584
New Zealaud 5

There is, however, only a moderate business at these figures, the jobbers being generally in a position to furnish Rope at somewhat lower prices. The market is characterized by a firm tone.

Copper Wire.—For some time past there has been a demoralization in price of Bare and Insulated Copper Wire. Manufacturers of these goods at a recent conference decided to maintain prices on a somewhat higher level, and in conacquence some advances have been announced.

Glass.—Activity among the Window Glass factories of the country ceased June 30, as the fires were put out of blast for the summer. It is conceded that stocks of Glass in first hands are less than for many years at the time of the annual shut down, the amount of Glass at present being estimated at 1,000,000 boxes. Manufacturers usually expect to have an accumulation of Giass for the summer and early fall trade, varylug from 2,000,000 to 4,000,-000 boxes. It is reported that about 100,000 boxes of foreign Window Glass is now in bond awaiting the settlement of the tariff question before the duty is paid. Pittsburgh factory quotations are reported as being from 80 and 10 to 85 per cent. discount, much depending upon the desirability of the order. Orders for Plate Glass are reported plentiful at all the factories now in operation. Quotations are given as 70 per cent. discount for sizes 5 feet and over, and 70 and 10 per cent. discount for sizes 5 feet and under, for New York and New England, on the Eastern list. For the West quotations are reported as 70 and 5 per cent. discount for sizes over 10 feet, and 60 and 20 per cent. discount on sizes 10 feet and less, on the Western list.

PAGE.

Old Metals.—The market for Old Metals has been quiet. Prices remain at the former level, the following quotations representing about the rates paid by dealers in the city for small lots:

Heavy Copper B 6%4
Light and Tinned Copper 2 1 6 \$

### Trade Notes.

STACK ELBOWS are shown in some variety in the advertisement of the Excelsior Steel Furnace Company, 38 West Monroe street, Chicago. They manufacture all kinds, all sizes, double and single, in IC and IX weights and carry them in stock ready for prompt shipment, as well as other Furnace Fittings essential to a complete line.

THE BURGESS SOLDERING FURNACE COMPANY, Columbus, Ohio, advise us that they have just been granted a patent on their Gem Gasoline Soldering Furnace in the Dominion of Canada and will at once proceed to manufacture them in that country.

THE ILLINOIS ROOFING & SUPPLY COMPANY, 203 Lake street, Chicago, reduced their price on Gilbertson's Old Method Roofing Tin. They quote IC, 20 x 28, at \$17.50, and IX, 20 x 28, \$20.50.

A FOURTH OF JULY ADVERTISING DEvice has been distributed by the Nubian Iron Enamel Company of Cragin. Ill. A slip of paper gives some pointers on the quality of Bonnell's Nubiao, part of which is expressed in poetry. The reader is directed to apply a spark to a letter and see the effect. The spark slowly traverses across the paper, burning out the word "Nubian" in bold capitals, and explodes a cap as a climax.

THE TOLEDO MACHINE & TOOL COM-PANY, Toledo, Obio, manufacturers of Presses, Dies and Sheet Metal Tools in general, are running their plant extra time in order to get out as fast as possi-ble some large orders which the firm have on hand. At present this concern are just completing some large sized Presses, among which is a special machine with automatic feed attachment for making links for steel chain belting. The machine will weigh about 10,000 pounds, and will have a capacity for making about 40 links per minute where 1 link is made at a time. It is also so arranged that two links smaller in size can be made at one operation. They are also putting on the market a new power Lock Forming or Edging Machine, for which a number of valuable features are claimed. In addition to these they have recently brought out a new Bail Forming Machine for forming up bails for tin pails, buckets, &c. The new Riveting Machine, especially adapted for the manufacture of tinware, put on the market by this concern some time ago, is reported as giving satisfaction.

Thomas F. Sanford, proprietor of the Queen City Wire Works, 193 Seneca street, Buffalo, N. Y., is show ing many seasonable things in wire goods, such as tree guards, lawn settees and chairs, while be makes a specialty of the manufacture of flat brass and iron Grill Work for offices and elevators. He also supplies all sorts of brass and galvanized iron work, as well as Foundry Sieves and Brushes of every character.

THE CLARK STAMPING COMPANY are a new enterprise located at Rochester, N. Y. They have erected a five-story building at East Rochester and have set up machinery for stamping all kinds of small articles from sheet metal. One of their specialties will be a Back Band Buckle for use on web harness, such as is used in the Southern States. They have a tinning plant in connection with their works for tinning goods of their manufacture.

THE SHEET MILL of the Lalance & Grosjean M(g. Company, Harrisburg, Pa., resumed work in all departments on Monday, after a shut down of some weeks, owing to want of fuel.

#### Reduction in Radiators.

The American Radiator Company, 111 and 113 Lake street, Chicago, have arranged to sell the entire output of Favorite radiators manufactured by the M. Steele Company of Springfield, Ohio. They are listed at 18 cents for steam and 20 cents for water. On radiators manufactured by themselves they announce the following important reductions in price: Two cents a foot on direct steam radiators of the Perfection, Detroit, National and Ideal patterns.
On the National single column, 1 cent; on the Peerless, 2 cents; on the Detroit plain fluted, 1 cent; on the National four-column, Perfection flue and Excel-slor patterns. 2 cents; the new Detroit flue, standard hight, not listed before, is 18 cents. On indirect steam radiation they have reduced the Perfection pin 5 cents per section on standard sizes and 10 cents per section on extra large sizes. On water radiation the following reductions are announced: On Perfection, Detroit ornamental flue, Ideal and Peerless, 3 cents a foot; on National two column, 4 cents a foot; on National four-column, 2 cents a foot;

foot; on Perfection flue, 2 cents a foot; Detroit flue, standard hight, not listed heretofore, is quoted at 19 cents. On Excelsion indirect the reduction is 15 cents per section. On dining room radiation the discount amounts to 163 per cent. On direct indirect radiation the reduction is 4 cents per section. They have changed their terms of payment, so that they are now 3 per cent. discount for cash in ten days, 2 per cent, for cash in 30 days, with regular terms of 60 days. The reasons for mak. ing these reductions are stated by the company to be the lower prices at which they are able to purchase their raw materials and lower rates for labor, so that in making their contracts for the manufacture of their goods for the year they have been able to make economies in the cost of manufacture which they are pleased to share with their customers.

The index for *The Metal Worker*, Volume XLI, January-June, 1894, is now ready, and may be obtained on application to David Williams, publisher, 96-102 Reade street, New York; or to 220 South Fourth street, Philadelphia: Room 509 Hamilton Building, Pittsburgh; 59 Dearborn street, Chicago: Rooms 22-24 Pickering Building, Cuncinnati; Bank of Commerce Building, St. Louis: 146 Franklin street, Boston, and 312 The Chyahoga, Cleveland.

#### Roofing and Cornice Instruction.

The announcement made on another page as to the decision of the management of the New York Trade School to inaugurate a day class for instruction in roofing and cornice work will be of interest to many of the readers of The Metal Worker. So far as we know, no such means of education in this particular trade exists in the United States. The opportunity, therefore, should be a welcome one to young men desirous of obtaining a sound training in roofing and cornice work. That the course of instruction will be thorough and efficient is guaranteed by the fact that the New York Association of Master Roofers and Manufacturers in Sheet Metal will co operate with the managers of the trade school and supervise the class.

### Prepayment Gas Meters.

At the last annual meeting of the Incorporated Gas Institute of Great Britain an interesting inaugural address was delivered by the president, John West, on the general question of gas consumption and the means of promoting it. A part of especial interest was that which concerned the prepayment gas meter. Every one is familiar with the variety of penny in the slot machines which flooded the country a few years since. Most of them were of the toy order, but in some directions

there were useful applications of the idea. A year er two ago reference was made to the application of the plan to gas meters, by which means on depositing a coin of a certain denomination in a meter the householder was provided with a given number of cubic feet of gas. It appears in England this apparatus has come into greatest practical use, and it is likely to have still further introduction. As showing the degree the business has reached it is mentioned that the number of prepayment meters that have been made and ordered amounts to nearly 68,000, of which 27,000 have been supplied to the Liverpool & South Metropolitan Gas Company. A table annexed to the address of President West gives many interesting particulars concerning the application of the prepayment gas meter system by some 20 different English companies. In most of the places this style of meter was restricted to houses of low rental, workmen's cottages and the like, though in some others it was used in residences of all classes. It is the plan abroad apparently to supply the ordinary pipe and gas fixtures, such as wall brackets, and in some instances a cook stove or range, &c., the householder contracting to give up the apparatus and fixtures on the demand of the company. The price of gas, according to the reports furnished, varies from about 58 cents to \$1 per 1000 cubic feet, and the prepayment meters are arranged to furnish from 20 to 28 cubic feet for 1 penny (2 cents.) Of the 20 companies reporting 7 furnish 25 cubic feet for that amount. Undoubtedly the introduction of this system has increased the consumption of gas, but it has been used so short a time that accurate statistics are not obtainable. The general average would perhaps be 10,000 cubic feet a year used by each meter. The experience of the English companies in this matter is worth bearing in mind, and with the increasing use of gas stoves the possibilities of the prepayment gas meter will still further extend.

### Rest and Recreation.

The Saturday half holiday is being more generally observed in New York City and Brooklyn this season than during any previous summer. A large proportion of stores and offices close at 1 or 2 o'clock on the last day of the week and many factories and industrial establishments are following the same plan. It has been found to pay. Employers who have had experience of Saturday early closing in the heated term find, as a rule, that they lose nothing by it. They are rather the gainers. Clerks, workmen and employees generally are ready to re-

turn on Morda, morning, refreshed and reinvigorated and far more capable of good work than if they had not had the Saturday attern in for recreation. It gives to many the opportunity of getting away out of the heat of the town to the cooler and fresher atmosphere of the seaside or the country for a full day and a half. This boon to a tired worker during the exhausting weather of a typical New York July and August is incalculable. Early closing on Saturday has been the rule in Eugland and in many parts of the Continent of Europe for many years, with the best results in respect of the physical well-being of their workers. The increase of public holidays in the United States is a healthy sign of the times. There has been too much strain and stress in the working lives of our people hitherto. It is time to take a little more leisure for repairing the waste of tissue and resting the overwrought hand and brain. It pays

### A Little Object Lesson.

The report just made public of the result of the attempt to operate a rolling mill at Hubbard, Ohio, on the cooperative plan is extremely interesting. After paying up all outstanding indebtedness there will be a surplus of about 25 per cent, to distribute to the stockholders out of the 50 per cent, of the wages that have been retained by the managers to create a capital. This is equivalent to a reduction of 25 per cent, in wages for the time that the mill was in operation. In other words, in order to get out even the company could only afford to pay 75 per cent. of the wage scale. This should be a practical lesson to rolling mill hands of the difficulties which now beset employers. If men who are working absolutely in their own interest, and are therefore watching every corner and practicing the utmost economy in fuel consumption, care of furnaces, breakage of rolls. &c., can not show better results, how can they expect full wages to be paid by manufacturers whose workmen have no financial interest whatever in the plant? By what hocus pocus can the average mill make a profit when a mill run by first-class men, as this one undoubtedly was, shows such a loss?

An alteration which will be made in the arrangements of the New York Trade School for the season 1894-1895 is that the length of the course for the day trade classes will be four instead of three months, as heretofore. The extra month is introduced in order to give the necessary time for instruction in elementary plan drawing in connection with each of the classes taught. This is a new and valuable departure in the work of the school. The ability to make and comprehend a plan of work is an absolute necessity to a first-class workman in these days.

# THE LETTER BOX.

#### Loss in Pickling.

From W. W. T., Cleveland, Ohio. -We recently had some discussion with regard to the percentage of loss in the pickling of steel. If you care to do so we should be glad to have you make inquiry for information as to the average loss from this operation.

Note. - This inquiry, which comes from a large manufacturer of sheet metal goods, involves an interesting question, and we should be glad to have those of our readers who have had experience in the matter furnish us some particulars. More especially the tin plate manufacturers and makers of galvanized iron could furnish reliable statistics if they have kept records, and we trust some of them will write us for the benefit of our correspondent. As of interest in this connection we would present the following figures taken from a recent article on the subject of galvanizing. The figures refer to four different gauges of black iron and the weight of the black iron and of the iron after pickling are given, from which the loss may be deduced :

#### The Electrolytic Decomposition of Steel Plates.

From A. H. S., Philadelphia, Pa.-In reference to the well known rapid decomposition of steel tin plates and galvanized steel plates the thought has occurred to the writer that the trouble may be caused by electrolytic action. It is well known that steel is peculiarly susceptible to electrical influence, and it is just as well known that there is a constant greater or lesser action of electric influence in all substances sub ject to clectric action. The question arises whether electrical influence may not have the same effect on steel plates imperfectly costed with either zinc or terne coating that it has on the zinc pole of a battery when placed in juxtaposition to a pole of carbon, the effect of decomposition. As many know from observation of an ordinary tele phone battery, the process of decomposition of the zinc pole of the battery is always more rapid while the battery is working--that is, while the telephone is operating-so that it follows that the precess of decomposition of the zinc pole is the result of electrolytic action. May it not be a fact that the rapid deterioration of galvanized steel sheets in particular when used for such work as cornices, conductor pipes, &c., coming in contact with the sulphurous acid known to exist in quantity in the stmosphere of those portions of the country where coal is largely used as fuel, is caused by electrolytic action, generated by the acid in the atmosphere through the medium of the zinc and carbon of which the plates are largely composed, I

creating as it were an electric current or effect of sufficient force to accelerate the process of decomposition of the steel in the plates by electrolysis? fact, it may not be necessary that the steel plates shall be costed with either zinc, tin or terne in order that the action of electrolysis may take place. Steel itself, and particularly the soft annealed steel of which all plates must necessarily be made, may and probably does have that electrical quality within it which, through the influences I have recited, leads to its destruction as a p'ate and its resolution into an en tirely different element. When it is asserted that iron pipes under the surfaces of streets are affected by electrolysis and disintregated through the action of the underground wires used for trolley cars, such action affecting the pipes, although apparently remote from the electrical influence, one can readily infer that a sufficiently active electrolytic action may exist within the electrical field of fragile steel plates imperfectly coated with either tin or terne coating, and galvanized steel with the coating pecked off here and there through the process of working it into the shapes in which it is used, to cause all the evils now known to exist and which did not exist when iron was used for those purposes before it was supplanted by the apparently cheaper steel. If my idea is correct it follows that the present method of constructing tremendously expensive armored ships of steel and subjecting them to the action of the muriatic acid knowu to exist in sea water puts them in presence of an enemy more formidable than all the navies of the world.

Note. - Our readers will undoubtedly be interested in these views of our correspondent, but we fear he has not struck the correct solution of the difficulty. The electrical action that takes place when iron and zinc are together in the presence of moisture results in the destruction of the zinc and not of the iron. In fact the presence of zinc in combination with iron is a means of protecting the latter mctal. It is used on ships' bottoms to preserve the iron plates, and experiments have also been carried on abroad, in which a bridge was connected with a zinc plate sunk in the damp ground, the result being that the plate was corroded and the bridge preserved. Our correspondent is also probably aware of the method of protecting tinware by means of small pieces of zinc soldered into the utensil, so we fear his explanation is not applicable to the present trouble. There is one bearing of it, however, that should be noted: The electrical current developed in the presence of the two metals will result in the more rapid destruction of the zinc than if it were not used in connection with iron. In this way the black sheet is more quickly stripped of merged steam condenser. In passing

its protecting metal and corrosion is given thereby a better chance to progress. Or again, if we consider the possibility of electrical action within the steel itself, so to speak, between the carbon and iron, leaving the zinc coating out of consideration, there is still no reason to believe it, if it exists at all, to be an adequate explanation. If it were so, cast iron would corrode more readily than wrought iron, for in the former the carbon is separated to some extent in the graphitic form and the analogy to an electrical battery is more close. As a matter of fact, however, cast iron resists corrosion far better than the purer metal and makes much more enduring water pipes and water receptacles. As of general interest in this connection it may be remarked that quite recently new theories have been put forth concerning the rusting of iron, the old explanation of the manner of the oxygen combining with the iron not serving to explain some of the phenomens of rusting.

#### Choked Water Backs.

From D. H. B., Phanix, Ari.—Having read the articles on "Choked Water Backs" in The Metal Worker of May 19 and June 2, would say that one of my "steady jobs" here is putting in new water backs. The water here is full of alksli, so much so that water standing in an open vessel, co'd, will leave a noticeable deposit; and when heated deposits very rap'dly and in large quantities a substance that is almost impervious to liquids of any kind. I had the same idea as is advanced in your answer, Msy 9, "that a large pipe should be used in making coil water backs," but found after a fair trial that inch pipe is the best size to use, and that only one coil should be used, as it is not so liable to fill up with sediment. I have found that it is an absolute necessity to have the cold water pipe to the water back as straight as it is possible to get it, and when it is, that the water back will last from two to six months longer. The only remedy that I know of to clean a choked water back is to put in a new one. I put in one; yesterday to replace one that was burned entirely through, the city pressure (of 40 pounds) being on all the time and no complaints to speak of, except from the cook, who said he could "get no hot water" and that the fire box of the range was "wet" every morning. The two burned ends, being solid with deposit, kept it from leaking.

I send by express a small piece of the deposit taken from an old pipe that had been used as the overflow from a con-denser at the ice works here. The water was first used in cooling an elevated, hot ammonia condenser; from there it ran through a large tank that is used as a cooler, and then over the subover the two condensers and through the tank the greater part of the sediment was left, but enough passed over to give you an idea of how it acts when cooling and of the character of the deposit. In steam boilers a compound serves to keep the scale soft; but it (the scale) has to be scraped from the tlues about once in two weeks in order to do good work.

Note.—The sample of deposit referred to looks as if it had come from a battered 3-inch tin or sheet iron pipe from its irregular shape and has an irregular hole through the center that is about equivalent to a 1½-inch pipe. The material seems like a dirty, coarse marble, and on what we suppose was the bottom side it is ¾ inch thick, the opposite

furnace was adjusted correctly a naked hand could be laid on the smoke pipe and held there without any inconvenience. How much upward current would be obtained by his method? Again, according to the system "T. H. H" has adopted, the vent should be nearly equal to the inflow, but the outlet amounts to about one-eighth of the inflow. The vent stack should support a velocity of not less than 600 feet per minute with a proper adjustment, but as planned one-third of it could not be maintained. He remarks that if "W. S. G" had taken the pains to read the carpenter's specifications he would find so and so. When did it become obligatory for the heating man to read the carpenter's, the plumber's and the mason's specifications to find out what he was expected to bid on? His remarks on smoke

wrapping, his cellar would overheat and his furnace would not last onethird of its natural life. I think a careful study of the iuclesed diagram will bear me out in the judgment of any first class heating man.

Note.—Sufficient space has been devoted to the consideration of this heating plant for all to have learned something from it, and we think our readers will be satisfied to let "Casar's" letter be the last one on the subject. We have received a letter from "W. S. G." in which he states his desire was not to offer offense, but rather to give opportunity for furnacemen to learn, and his purpose has been well served.

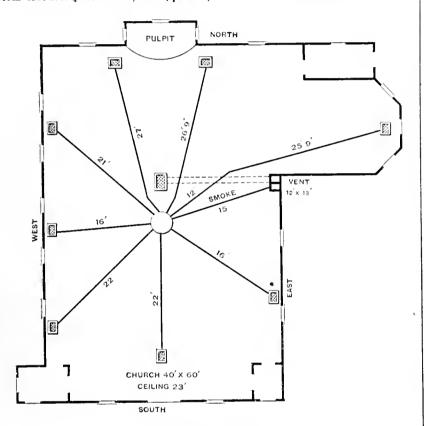

## Wants Statistics on Brick Set Furnaces.

From GEO. M. BARR, Allegheny, Pa. Commenting on "Caesar's" letter in The Metal Worker of June 23 regarding brick set furnaces, would say that while we have never learned the per cent. of decrease in use of same, we know there has been a considerable falling off in this locality, as well as the territory covered by salesmen south and west of here. There are several reasons for this. The portable furnace is chesper. It requires less room. When cased as our furnaces less room. When cased as our furnaces are there is less radiation of heat in the cellar. The portable turnace is much easier erected, and at less expense to contractor. It is also cleaner. Iu case of making repairs to castings the work can be done in half the time and with less expense than it could be done in the brick set furnace, and mason's services are not required. It has occa-sionally been said to us that metal casings are easily damaged and banged up.
We have not found this the case, and we have our apparatus in schools, churches, stores, asylums and dwellings. Of course the metal casings will not stand the onslaughts of an axe or sledge hammer in the hands of a dctermined, able bodied man, and up to date we haven't seen a brick casing that would either.

Notwithstanding every effort on the part of the employers to arrive at a settlement of the dispute with their operatives, the prolonged Trenton pottery strike still continues, with little present prospect of an adjustment. Conference committees of manufacturing and operative potters met last week and had practically agreed to compromise on a reduction of 15 per cent. in wages from the old list, when the operatives suddenly withdrew their authority to the committee to settle the atrike, restlirming their claim to the old rate of wages.

Reports come from Parls to the effect that the liquidators of the Panama Canal Company have signed an agreement with a new company, capitalized at \$300,000,000, who undertake to complete the canal.

Large Irrigation works costing \$2,000,000 and Irrigating 400,000 acres of land are to be built in the Rio Verde Valley of Arlzona. The work is to be completed in 18 months. It includes about 110 miles of canal, and a reservoir of immense capacity.

Wants a Better System.

side being only §. One end evidently has been broken, as it shows an irregular fracture; the other has been sawed off, showing that the material is quite hard. The suggestion of "P." in *The Metal Worker* June 23 would prevent the trouble in the water back, but that there would be a deposit at some other point is quite probable where there is so much alksli in the water.

### Wants a Better System.

From C.ESAR, Louisville, Ky.—Having read remarks in The Metal Worker, June 23, by "T. H. H." on article by "W. S. G.," May 12, I am still constrained to say the former is very much in error in his ideas of planning a hot air heating job. I find by measurement that the vent flue is only 12 x 18 inches, which "T. H. H." states is warmed by the smoke flue. Has he ever tested a flue of this kind to see what degree of heat would be acquired from the smoke flue? Has he ever tested the velocity of the air in a job of this kind? If the

stack shows that his experience is limited in regard to this one point. It has been granted by experienced men that a stack which has its top below the comb of the roof is objectionable, and prevents a man who understands his business from guaranteeing a job completely. The only safe way is to insist that the chimney should reach a few inches above the comb of the roof. He speaks of having some experience with an undivided column of air, and speaks of some people roasting and some freezing. He should be very certain of the quality of the work that his experience came by before he undertakes to criticise other people's work. I say, and can prove it by actual experience, that if the job is adjusted properly the person next to the register is no warmer than the one 20 feet away. And also that one cannot feel any current until reaching the perpendicular line of opening in the register. This statement has been substantiated too often to admit of an argument. Again, his adjustment of the job cannot show less than 188 feet of cellar pipe, and by this plan, notwithstanding his asbestos

## Press Working of Sheet Metals.—IX.

BY CREBLIN SMITH.

coining Processes.

The process of coining, as has been indicated earlier in this article, is analogous to drop forging; or pumping melted metal into a type mold; or squeezing a piece of soap or clay in the palm of one's hand; or molding a pat of butter. In it we see illustrated the principle of the flow of tolida even more vividly than in the drawing

process

In Fig. 298 is shown, in vertical axial section, a pair of ordinary drop press dies, arranged for drop forging a small hand wheel, as shown in axial section in Fig. 300 and in top view in Fig. 30t. It is possible to do such work as this cold, where copper, lead and other soft metals are used. In practice such dies are more often cmployed for iron or steel, heated almost to a white heat. In Fig. 299 is shown a blank from which the wheel is made, which may be of any appropriate form. In this case it is simply a round punching, made from that bar iron. The process is, of course, simply one of molding, the die L being rigidly se cured to the bed of the press and the die U to the ram. The latter descends one U to the ram. The latter descends from a considerable hight, and with a force for greater than is usually em-ployed in sheet metal work. A disproyed in sheet metal work. A distinguishing characteristic of such products is the beautifully irregular little fin, surrounding the work like a halo at a a. It is true this fin might not occur, but it generally does. Its absence is attainable only by the blank being placed exactly in the right position, remaining there during the blow, and containing exactly the right amount of metal. These fins, as before intimated, are always present in some degree, but are trimmed off afterward in what is called a trimming press, in which are mounted dies that are, of course, nothing but ordinary cutting dies. Obviously, by this process such articles only can be made as will deliver freely from the dies, by reason of having considerable taper and no high vertical

walls.

The process of coining, as employed for manufacturing medals and metallic money, embodies the same general principles as drop forging work, but is carried out very differently in detail. Furthermore, the metals used are generally worked cold, and there is much more uniformity in the general design of the product than in the drop forging art, whose products embrace almost every concelvable kind of article adapted to

the processes employed.

In Fig. 302 are shown, in vertical axtal aection, a pair of coining dies, U and L, together with their collar C, such as are used in the mints of all the principal civilized nations of the earth for stamping the coins of the realm, from so-called "planchets" or milled blanks, as shown in axial section in Fig. 306. These dies are shown in open position, ready for the planchet to be fed into them by sliding it over the face of the collar and allowing it to drop into the same and over the lower die. In Fig. 303 the same dies are shown in closed position, when giving pressure to the embryo com. In Fig. 304 they are shown when the upper die has risen out of the way and when the lower die has risen in its collar to

cject the coin; or, as is often the case with an alternative device, when the collar has descended for the same purpose, the lower die remaining stationary.

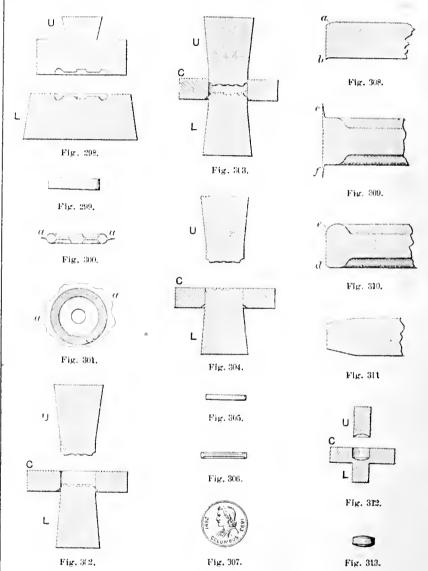

ary.

In Fig. 305 is shown, in edge view, a blank as punched by ordinary round cutting dies from a strlp of metal of the proper thickness; and in Fig. 308 an enlarged partial section of the same appears. At a b are shown the characteristic rounding on one side and burring on the other, incident to all punching operations. These, however, do not signify, as the milling machine kindly

takes care of them.

cogs, running parallel with the sxis of the coin. These are formed by fluting the internal surface of the collar c, which, by the way, is made very slightly conical, to facilitate easy deliverance.

It is evident that in this kind of work, as well as in drop forging, there is a tendency to produce unwelcome fins, should there be a surplus of metal to the slightest degree. These fins of course tend to form as at e and f, Fig. 309, in the only place available for the metal to escape, which is in the joints between the dies and collar. Manifestly they must be avolded, and great

PRESS WORKING OF SHEET METALS.

In Fig. 306 is shown in section as before mentioned and in Fig. 310 in partial section a planchet which has been made from a blank by the "milling process" so called. This consists of rolling the edges in a special machine, the radial compression thus obtained upsetting or thickening them into the form shown, while at the same time the corners are rolled down to a rounded shape, preferably more like c than d. In Fig. 307 is shown the face of a finished medal which has received upon both aides at once reversed impressions from the respective upper and lower dies employed.

In some cases a coin or medal is reeded or fluted upon the edges, as is the case with our American silver and gold coins, the so called reeding consisting of a number of fine teeth, or

care is therefore taken, for this as well as for financial reasons, that the weight and consequently the approximate mass of metal in all the planchets shall be uniform, at least to within a very small limit of error. Even with this accuracy of bulk thers would sometimes be minute fins, especially as the dies cannot be depended upon to always come exactly the right distance apart, were an attempt made to produce perfectly sharp corners at c and d. For this reason, as well as for convenience and beauty in the coin, these corners are rounded, an attempt being made to leave them of nearly as great a radius of curvature as was given to them by the milling process. This, of course, can only be done by not pressing the planchet hard enough in the middle to

make the edge flow out violently and force itself into the Interstices of the mold, as in Fig. 309. Fortunately, with the metals ordinarily used, this can be done successfully, and yet a sufficiently deep, sharp, cameo impression can be obtained upon each face of the coin. The changing conditions above referred to, however-viz, some slight difference in bulk, a non-uniform descent of the upper die owing to springiness in the machinery, and certain trifling variations in the density of the metal—cause a different smount of edgeward flow. Consequently, upon some coins, and upon one face more than the other of some certain coin, and perhaps at certain places around the edge of a given coin face, the metal will flow outwardly scarcely at all, thus leaving a considerably rounded corner at c. At other times and places the circumstances mentioned will eause a greater flow edgeward, with the result of a much sharper corner, as shown at d. The constant effort of the coiner, how-ever, is to prevent d from ever becoming entirely sharp. A easual examination of any new coin will show, without a magnifying glass, these inaccuracies as to the relative sharpness of corners, even in different places upon the same coin.

Within a short time past, and since the production of aluminum has been so wonderfully cheapened, it has become fashionable to coin this metal into medals of all imaginable designs and degrees of beauty and ugliness. Some of the makers of these have attempted an excessively deep cameo effect. The metal, however, has proved itself too prone to flow wheresoever it listeth, with the practical result of a finned edge like Fig. 309, the metal near the periphery not proving itself to be a sufficiently strong boop to hold in against the radial flow started by the central expanding forces. The makers. who attempted but a small production, dressed the obnoxious fins off in a lathe, which, of course, was a slow and wasteful process. In any case, these difficulties were brought to the attention of the writer, who suggested the use of a planchet made thinner around its edge, instead of thicker, and also considerably tapered off, as in Fig. 311. Such a shape is easily made in a pair of special dies after cutting the blank, or in the sheet before cutting the same by compressing dies set in a gang with the cutting die, so as to produce the blanks at one operation.

This form of planchet proved successful, as the surplus flow from the center was, by the time the impressions were made, none too great to properly fill the edges of the mold, by which term I refer to the group formed by the closed dies and collar, closed as in Fig.

303.

In Fig. 312 is shown a pair of dies and a collar, such as is used for making the ordinary medicinal tablets, or disk shaped pills, shown in Fig. 313. These work precisely upon the same principle as do the dies in a coining press, and are sometimes made of other shapes than round, such as square, triangular, &c. The material in this case is usually a dry powder which adheres by compression. Any fins that may occur are so fragile as to rub off in handling, and are not noticed.

Soap presses also work upon precisely the same principles above described, and all the cake soap in common use is simply the product of coining the crude pieces of irregular shape, which are placed in the lower die by hand.

The same process is sometimes used

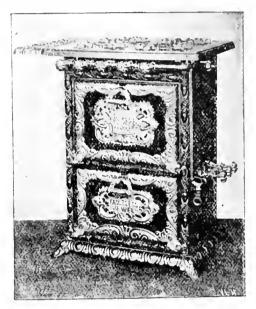

for compressing cakes of salt and other materials, usually in the form of reet angular bricks. The ordinary brick press of commerce is another illustration of a coining apparatus, the diea or molds being usually set in gangs of several together in a row. That formef brick press which uses dry powdered clay is a most as elaborately built as is a smaller coining press, but is, of course, relatively immense in its proportions and strength, as very great pressure is required to preperly compact the clay.

Regarding the pressure required for ordinary coining, but few data are available. The force applied to any given coin, however, of course considerably exceeds the ultimate compressive attempth of that particular piece of metal, otherwise it would not tlow.

The speed employed in such operations should not be too fast to obtain the fine impressions usually required. It is probable that the ordinary speed of a drop press ram might in some cases give the metal scarcely time enough to flow, but there is no difficulty in practically running such machines at a

enables the user to change the stove for different qualities of gas or for radical changes in pressure by lessening or increasing the air supply. A simmering burner for keeping things warm and a giant burner for extra power to boil the contents of a kettle quickly are provided on each stove, operated by valves at the side. The oven or brolling burner is double, extending the entire length of the oven and spreading the heat uniformly. The pilot light is provided with an air mixer the same as the reguar burners. It is said that the arms bring the light in direct contact with each burner so that they light instantaneously when the gas is turned on. The broiling rack is separate from the drip pan so that the latter may be placed at a suflicient distance from the burners to prevent the contents of the pan from taking fire.

The body of the range is made of cold rolled steel, japanned on the inside as well as the outside, a point to which the manufacturers direct special attention, the claim being made that such treatment doubles the life of the range.

The Faultiess Jewel Gas Range.

speed of from 100 to 200 strokes per minute, 120 being the usual standard for small coins in the United States mints, and 100 for the larger ones.

The presses used for medals, of which but small quantities are usually required, are generally hand fed, and are cither of the serew or toggle driven type. For regular coinage in Government mints, and in some cases in the factories of medal and badge makers, automatic presses are used in which the planchets are simply piled by hand into a long vertical tube, the machine doing the rest upon its own responsibility.

#### The Faultless Jewel Gas Range.

In order to keep up with the times in the way of modern appliances connected with the stove industry, the Detroit Stove Works of Detroit, Mich., have engaged in the manufacture of gas rauges and have just placed upon the market one size of what is known as the Faultless Jewel. A general view showing the ornamentation of the stove is presented herewith. The range has four burners in the top surface, these being of a special sawed pattern carefully adjusted. Every second slot is sawed but half way, thus bringing an equal distance between the flames. An adjustable air mixer on each burner

by preventing the moisture formed fromrusting through the body. Asbestos linings cover the entire steel body on the inside, thus retaining the heat within the range and economizing the gas. The castings are of smooth finish, artistically decorated, and, it is said, of great strength. The range is raised great strength. from the floor, thus providing for ample admission of air to the broiling chamber, while at the same time preventing the burning of the floor. The oven and broller doors are both poised, and when dropped form convenient shelves. The baking and broiling ovens are full flued, the flue plates being portable, so that they can be removed with ease when required. The bottom of the oven is protected from the direct heat of the burners by a heavy cast plate. A water heater attachment having an eight return coil pipe can be added at any time, taking the place of the top shelf. A double burner is provided, which, it is claimed, will heat water rapidly. The Faultless Jewel has a bake oven, 18 x 16 x 12 inches; brolling oven, 18 x 16 x 11 inches, while the body of the range measures 22 x 17 inches. The area of the top plate is 22 x 26 inches. The width of the top shelf is 8 inches, and the width of the top of the water heater 101 inches. The range atands. 36 inches in hight.

# THE TIN SHOP.

Patterns for Cold Air Box.

From A. L. M., New York City.—I have a peculiar elbow to construct in a cold air box which has puzzled me and some of my friends interested in pattern cutting, so I have concluded to ask The Metal Worker to solve the problem for me. The conditions are as follows: The box is rectangular 12 x 24 inches and proceeds horizontally from the bottom of the furnace 12 inches, thence it must reach a point 6 feet high, 4 feet further away from the furnace and at the same time have an offset of 3 feet. I inclose a rough diagram showing the position of the furnace and offset.

Answer. - Believing that the solution of this problem will be of general interest to those of our readers who are familiar with the subject of pattern cutting, we have taken some pains to consider the problem in its various phases and present herewith two solutions of it. Iu Fig. 1 the plan and side elevations embody the essential conditions of our correspondent's sketch, but we have substituted letters to represent the various dimensions instead of the figures given. Thus, a and b are used to represent the dimensions of the box instead of 12 and 24 inches, while c, dand e represent respectively the 6 feet, 4 feet and 3 feet mentioned cr, in other words, the hight, slant and offset of the oblique portion. The drawings are made to a uniform scale of § inch to the foot and corresponding points in the different views are lettered the same so as to facilitate making references from one view to the other.

We wish to call attention primarily to the fact that the solution of this problem is more a matter of drawing than of pattern cutting, as nothing can be more simple than the cutting of a miter between two pieces of rectangular pipc when the required angle between them is known. All of which points to the necessity of a knowledge of the principlea of geometric drawing, a subject upon which very little has been written for the benefit of the pattern cutter. That branch of drawing which most directly concerns him is known in the books as "Orthographic projection," the principles of which are quite simple and casily understood. These principles if carefully studied will render him much valuable assistance, of which the present instance is ample proof.

As it is necessary that drawings of some kind be made before the pattern can be developed, we will proceed to construct them upon the data given. First draw a plan and elevation of as much of the furnace as is necessary to show its connection with the cold air

box, placing each part of the plan directly under its corresponding part in the elevation, so that as soon as any new point is determined in either of the views its position can be located in the other by means of a perpendicular line dropped from one view to the other. Upon the plau set off the width of the box b and draw parallel lines from the side of the furnace body to the right indefinitely, and upon the elevation set off its blght, a, from the floor line up, and draw A Z. A vertical line from the point X of the plan will give the point Z upon the elevation, or, in other words, show how far the curve of the furnace body cuts into the top and bottom surfaces of the cold air box. Next, upon the elevation locate the point A 12 inches from the side of the body according to specification and find its position in the plan by means of a vertical line. as shown. From the point A in both views lines must be drawn to represent the angle or deflection of the pipe as it would appear in those views. Thus the elevation would show the slant, which is determined by the two dimensions c Therefore from the point A of the elevation erect a perpendicular line equal to the required hight c, from the top of which draw a horizontal line to the right of a length equal to the amount of slant d, thus locating the point E, which connect by a straight line with A. Then will A E represent the angle of the oblique portion of the pipe as it appears in the elevation But according to the requirements the pipe is also to have an offset a distance equal to e-that is, the point E of the elevation is nearer the observer than the point A. Therefore from A' of the plan draw a line forward the amount of the offset, from the end of which draw a line to the right, in length equal to d. or in other words till it comes directly under the point E of the elevation, thus locating that point in the plan, and draw A' E', which will show the apparent angle in the plan.

The depth and width of the oblique portion of the box will next demand attention. At right angles to the line A E of the elevation set off the depth of the box a and draw a line to represent the lower near corner of the box, which continue downward until it cuts the floor line, as shown at D; then draw A D, which represents the miter cut for the side of the box. At right angles to A' E' of the plan set off the width b, as shown and draw a line parallel to A' E' interaccting the line from X at B', as shown, and draw A' B', which gives the plan of the miter cut across the top

of the box. As the point D of the elevation is in the same vertical plane as A, it may now be dropped into the plan, intersecting with the line showing the front side of the box in that view, as shown at D'; and the point B' of the plan, being on a level with A', may be projected into the elevation, where it would intersect with the line showing the top of the box at B. A line drawn from D' of the plan parallel to A' E' (shown dotted) will then show the position of the lower near angle of the inclined portion of the box, and a line from B of the elevation parallel to A E will show the position in that view of the further top corner of the box

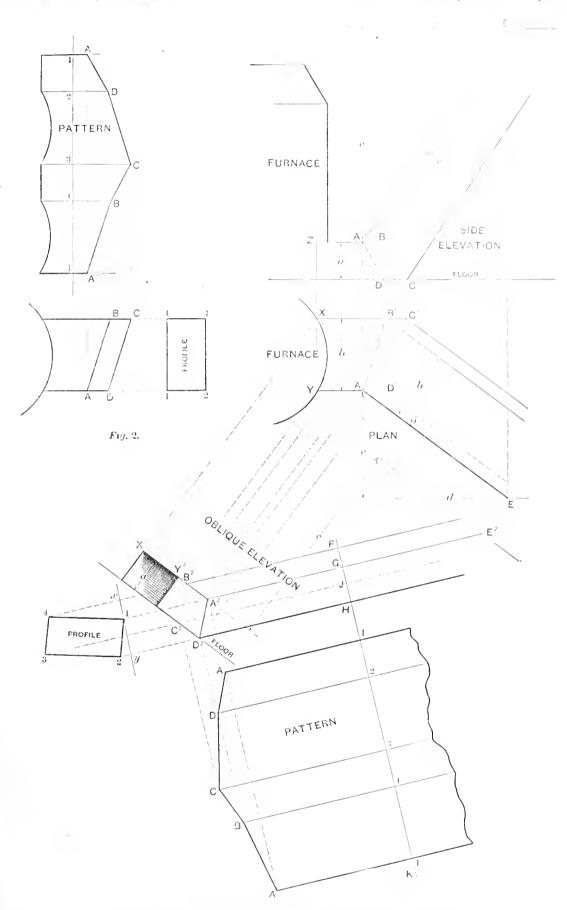

The position in the two views of the remaining angle of the inclined portion of the box may be ascertained in several ways: The width b may be set off from D' of the plan and a line drawn which will intersect with X B' continued, as shown at C'; thence it may be projected into the elevation at C, as shown; or the width a may be set off from B of the elevation, thus locating the line which intersects with the floor at C, which point may be dropped into the plan, thus locating the point C'; or, again, BC may be drawn parallel to A D, or D' C' may be drawn parallel to A' B', all producing the same result.

Those familiar with what in cornice work are called gable miters will no doubt at this stage notice the similarity between the relative position of the two portions of the air box, and the relative position between the two arms of a gable miter, in which the inclined arm meets the level arm at an octagon angic. Every experienced pattern cutter knows that in such a case, if the normal profile is adhered to in the level arm, the profile of the gable mold must be changed or "raked" before a perfect miter joint can be obtained. What is true in the case of the gable miter is equally true in the case of the furnace pipe-a correct profile or cross section of the box must be developed in order that a correct stretchout may be obtained for use in cutting the miter of the inclined arm of the pipe. As neither the plan nor the elevation, which we have taken pains to obtain correctly, gives the true length of the inclined plece—that is, the true distance from A to E-it will be necessary to obtain atill another elevation, in which such distance is correctly shown. As A' E' of the plan gives the horizontal distance between the points A and E, and c represents the vertical distance between them, if we construct

a right angled triangle with A' E' as a 1 base and c as the perpendicular, the

line A E of the plan, as follows: Parallel to A' E' at any convenient dis-

pipe. Above the line X: A:, at a hight equal to c, draw still another line, upon hypotenuse will then give us the de- | tance away draw a line to represent | which the point E is subsequently to be

Patterns for Cold Air Box.-Fig. 1.-Plan, Elevations and Patterns.

sired measurement. To accomplish | this according to prescribed drawing

which at a distance equal to a draw points of the plan, at right angles to methods, we will proceed to project an another parallel line, X<sup>2</sup> A<sup>2</sup>, representing by A' E', intersecting each with its coroblique elevation at right angles to the hight of the horizontal arm of the responding line of the new elevation,

the level of the floor, as shown; above | found. Now drop lines from all the

thus locating each point of the miter in that 'view. As points B' and C' are upon the 'loor, their position will be found at D' and C'. Likewise lines from A and B will locate those points in the upper surface of the horizontal pipe, as shown at A' and B', where they are also shown to be in the side elevation. A line dropped from E' will

by other parts are always shown dotted. Lines from X and Y locate those points in the new elevation, and show that while we have obtained a correct elevation of the inclined arm of the pipe we have also obtained an oblique view of the horizontal portion, the space between  $X^2$  and  $Y^2$  showing the open end to fix against the furnace body.

to them as a base from which to measure distances from front to back.

Assuming its crossing with the line from G (point 1) to represent the near angle of the pipe, set off from x on the line from F the horizontal breadth of the pipe b, thus locating point 4, which corresponds to the point F in the elevation. In like manner on the line

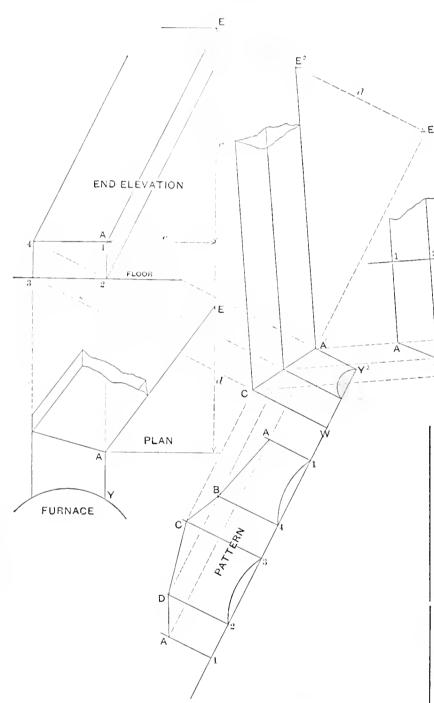

Fig. 3.—Pattern Derived by Second Method.

also locate that point at its proper hight, as shown at E<sup>2</sup>. A line connecting A<sup>2</sup> and E<sup>2</sup> wilt then be the hypotenuse above alluded to, and be the correct length sought. As all edges or corners, of the pipe are necessarily parallel, lines drawn from B<sup>2</sup>, C<sup>2</sup> and D<sup>2</sup> parallel to A<sup>2</sup> B<sup>2</sup> will complete this part of the elevation as far as necessary. In these, as in all geometrical drawings, lines showing parts concealed from view

Having now obtained a correct elevation, the next step is to obtain a correct profile upon any line, as F H, drawn at right angles across the pipe, which may be accomplished in the following manner: From each point upon the line of the section F, G, J and H, project lines parallel with the direction of the pipe to a convenient point outside the elevation, as shown at the left, across which draw a line, xy, at right angles

from H set off from y the distance o of the elevation, locating the point 2, which corresponds to point H of elevation, and draw the lines 1, 4 and 1, 2. The distance of point 3 from line x y is equal to distance b plus the distance o, or in other words draw the line 2, 3 parallel to 1, 4, and the line 4, 3 parallel to 1, 2, thus locating the point 3.

PATTERN

Having now a profile and a correct elevation of the miter, nothing remains but to lay off a stretchout, as shown, upon the line H K and drop the points in the usual manner from the profile to the miter line A<sup>2</sup> B<sup>2</sup> C<sup>3</sup> D<sup>2</sup>, thence into the measuring linea of the stretchout, all as clearly shown in the drawing.

As the plan shows all the dimensions of the horizontal arm of the pipe, the pattern for that can be developed in the usual manner. To avoid confusion a duplicate of that part of the plan has been transferred to Fig 2, where a stretchout of the normal profile is laid off at right angles to the lines of the pipe, into which the points are dropped from the miter line A B C D. In the normal profile of course the distances 1, 4 and 2, 3 are equal to b and the distances 1, 2 and 4, 3 to a.

It may be here remarked that the raking of the profile necessarily changes the dimensions of the inclined arm of the pipe, but as the change is very alight and only done to make a miter,

it can acarcely be considered as a violation of the original specifications.

But, the person of inquiring mind asks, is there no way of producing a miter without a change of profile, just as a carpenter would saw off the ends of two square sticks of timber of the same action and produce a perfect miter at an oblique angle? We reply there is, but the method of doing it is not so apparent as the one just described. To accomplish this a drawing or view must be obtained, in which the surface of the paper represents a plane common to both arms of the pipe. As three points determine the position of a plane, it will be seen at once that such a plane passes through the points Z, A and E. The best means of obtaining this view is shown in Fig. 3, in which the plan shown in Fig. 1 has been reproduced, but turned around in such a manner as to facilitate the projection from it of an end elevation, all of which is clearly shown in the drawing. This view shows the offset e and the rise c of the oblique portion of the pipe. The new view, which will give the required conditions, is obtained by looking at the pipe in a direction at right angles to A E of the end elevation, and is obtained as follows: Parallei to A E at any con venient distance away draw A' E', which make equal to A E by means of the lines drawn at right angles to A E, as shown. Upon the line E' E set off from E' the slant d as given in the side elevation and plan, Fig. 1, locating the point E2, and draw the line E<sup>2</sup> A'. From all points of the profile or end view of the horiz intal pipe, 1, 2, 3 and 4, project lines also at right angles to AE, continuing them across the line A' E', and make A' Y' equal to A Y of the plan. Then A' Y2 will be the length of the horizontal arm in the new view and A' E2 will be the length of the inclined arm, both lying in the same plane, and the angle E2 A' Y2 will be the angle at which the two arms meet. Under the above conditions, then, a line which bisects that angle, as A' C, will be the miter line between the two arms. As the two arms of the miter are symmetrical, the view can be completed, if desired, by drawing lines toward E2 from the points of intersection with the lines from the end view with the miter line A' C. As 1, 2, 3, 4 is the profile from which the short arm was projected in the new view, a stretchout may now be taken from it and laid off on any line at right angles to C W and the points dropped in the usual manner, all as shown. If desired, the stretchout may also be laid off at right angles to the inclined arm and the pattern for this piece thus developed from the same miter line, although the miter cut A BCDA is the same in both pieces, one simply being the reverse of the other.

JAMES TUCKER & SONS were awarded the contract for the plumbing in the new High School at Somerville, Mass., at a cost of \$3170.

## HEATING R PLUMBING.

### NEW WORK AND CONTRACTS.

Tue town of Newton, N. J., has just decided to put in a system of water works, which announcement will be of interest to contractors and others.

McKim, Mead & White, New York, have made the plans for a fine residence for E. A. Saunders, to be erected at New Haven. It will be heated by two Mercer boilers and a Cottage boiler will furnish hot water for demestic use. The house will have three bathrooms and a first class system of plumbing.

A \$50,000 ADDITION will be built to St. Francis Orphan Asylum, at New Haven, Conn., and will be heated by steam.

C. HERPICH has the plumbing contract for the new house being built by Wm. Beck, at New Haven, Conn.

R. G. CARLETON and D. A. THOMPson are to build a double house at New Haven, Conn., to be heated by hot water and have a system of plumbing.

A PETITION from the plumbers of Lawrence, Mass., to the City Council, led to reopening the competition to supplying water closets for the public schools.

THE CLARK & WELLINGTON PLUMBING COMPANY, Bridgeport, Conn., are finishing work on two Thatcher furnaces for W. It Muirhead's house on Pembroke street, two for J. Funkie on Catherine street and one for D. F. Bogey on North avenue. They also have the contract to do the plumbing for a new house for W. S. Hurlburt and one for George Bright on Joseph street.

THE CONTRACT for ateam heating for the jail at West Ches'er, Pa., has been awarded by the county commissioners to James Bros., a well-known West Chester firm. The price was \$700.

HAYES & ROURKE, New Haven, Conn., have the contract for the plumbing in two houses to be built by II. E. Franklin.

THE PLUMBING CONTRACT for the new house of C. L. Deming, at New Haven, has been let to Sheahan & Groark, and the heating contract to the New Haven Heating & Plumbing Company.

THE QUEENS COUNTY SUPERVISORS awarded the contract for heating and ventilating the Long Island City, N. Y., Court House to Baker, Smith & Co., for \$1536.

THE WALTHAM HEATING & PLUMB-INE COMPANY, Waltham, Mass., have been awarded the contract for plumbing the B. M. Company houses.

Bids will be received till July 16 for the heating apparatus for three engine houses at Springfield, Mass., at the office of J. B. Dunleavy.

HUBBARD & Sons have the plumbing contract for the new hospital at Urbana,

Rubel & Co, 75 and 77 Lake street, Chicago, are to install a steam heating plant in the 16-flat building of II. M. Gromwold, 32 and 34 Walnut atreet, and a hot water heating plant in the six flat building of G20. W. Milliken, Thirtieth street and South Park avenue.

E. Bagoor, 169 and 171 Adams street, Chicago, has the contracts for plumbing, gas fitting and sewerage in the following apartment buildings:

E. E. Wilcox, Forty third street and Champlain avenue; Chas. F. Atkinson, 31 to 37 Lake avenue; F. II. Winston, 377 to 383 Superior street; James V. Burk, 2314 West Congress street.

J. J. Wade & Son, 276 Dearborn street, Chicago, have the contract for the plumbing, gas fitting and sewerage in the Reliance Building, State and Washington streets.

KEIM BROS. & MERTY 289 Kinzle street, Chicago, have the contract for steam heating in the Motley School, Shell street and Chicago avenue.

THE J. L. MOTT IRON WORKS 311 and 313 Wabash avenue, Chicago, are to place a star combination heater in the residence of J. Stanley Grepe, Evanston, III.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until July 31, for the plumbing, gas piping and electric wire conduit work in the United States Custom House and Post Office Building at Newark, N. J. Drawings and specifications may be obtained at the office of the Supervising Architect, Washington, or from the superintendent at Newark, N. J.

THE EXETER BOILERS AND RADIATORS are to be used in the new Hotel McKinley, at Boston, and also at the Saco House, Saco, Maine.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until July 31 for alterations in ventilation and repairs to steam boilers and heating apparatus in the United States Court House and Post Office Building, at Atlants, Ga. Drawings and specifications may be obtained at the office of the Supervising Architect, Washington, or from the Custodian at Atlants, Ga.

THE CONTRACT for heating St. Patrick's new church, at Fort lloward, Wis., has been awarded to C. L. Anderson of the Lake Superior Heating Company, for \$1245. The church will be heated by steam furnished by a locomotive fire box boiler, 44 inches by 10 feet. There will be 1700 feet of direct radiation and a stack of 250 square feet of indirect radiation.

C. C. STEBBINS, Albany, N. Y., has taken the contract for the plumbing, roofing and hot water heating of the residence of  $\Lambda$ . D. Mynders, which is now in course of construction.

ALEXANDER DON & Co., Newark, N. J, are setting some tanks and doing some plumbing and ateam fitting work at the Madison Square Garden, New York, in preparation for the World's Fair Exhibition, which is the next attraction to appear at this well-known pleasure resort.

CORBIN, McKINNEY & Co. are going to put steam heating apparatus into the Exchange Block, at Rossville, Conn.

THE KELLY & JONES COMPANY 48 to 52 North Clinton street, Chicago, have the contract for steam heating in the Frear Estate Building, 105 to 109 Madison street.

The Theo. Jacobs Company, 72 and 74 Market street, Chicago, are to install a steam heating plant in the State Safety Company Building, State and Van Buren streets.

THE CONTRACT for heating and ventilating the new central fire station at Somerville, Mass., was awarded to the Smith & Anthony Company, Boston, at a cost of \$993.

# STEAM AND HOT WATER.

The Niagara Radiator.

The illustrations presented herewith show a general view and one of the intermediate loops of the Niagara radiator, made by the Niagara Radiator Company of Buffalo, N. Y. This company recently erected a manufacturing plant at North Tonawanda, a few miles from the city named, which is interesting from the fact that it is altogether modern and is said to be provided with many labor saving devices and economical features, and will have an annual productive capacity of 1,000,000 feet of radiation. The works were lately put in operation and some preliminary shipments of goods have already been made. Fig. 1 shows the general appearance of the radiator, which is constructed with the idea of appealing to the artistic teste of the public. The two end acctions are made solid, giving the radiator a more finished appearance and affording opportunity for a different character of ornamentation than that usually employed. The intermediate loops, one of which is shown in Fig. 2, are of the three-column type, which has been adopted by the manufacturers, as they say it gives the best and quickest circulation for both steam and hot water. The smooth nipple connection

The Niagara Radiator.—Fig. 1.—General View of Radiator.

is employed in joining loops, using wrought iron nipples tapered in a lathe to insure a perfectly tight joint, and being connected at both the top and bottom they can be used for either steam and hot water. The radiators measure 10½ inches at the widest part, and each section takes up 3 inches of floor space. This allows ample air space between the

different sections, and it is claimed a more rapid and free circulation of air is the result. The radiators are made in four different hights—20, 20, 32 and 38

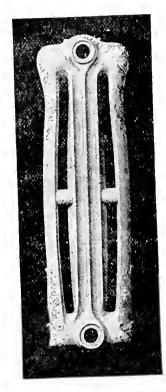

Fig. 2 - Intermediate Loop.

inches—exposing, respectively, 4, 5, 6 and 7 square feet of surface per loop.

### HEATING NOTES.

THE NEW CLASS to be established in the New York Trade School, New York City, for instruction in steam and hot water heating, will be atarted on January 2, 1895. It will be a day class, and will occupy a course of three months. The co-operation has been secured of the New York City Master Steam and Hot Water Fitters' Association, who will appoint a committee to supervise the work of the class.

THE ROYAL hot water and ateam heaters are the subject of a circular issued by Hart & Crouse, Utica, N. Y. The circular gives small views of the heaters, and the remaining three pages are devoted to testimonial letters and lists of references. The letters of testimonial come from owners of greenhouses, residences, public buildings, &c., located in all parts of the country, and are all of recent date.

WE ARE IN RECEIPT of catalogues relating to Richmond heaters for steam and hot water published in the interests of the Kennedy & Sullivan Mfg. Company, Holyoke, Mass.; George T. Barnes, Newburg, N. Y., and Grassler & Gezelachap, Milwaukee, Wis. All these pamphlets centain illustrated descriptions of the Richmond heaters, besides many testimonial letters, and, what

is of especial interest, views of residences and buildings in the different neighborhoods which are heated by the Richmond apparatus.

The popularity of the Cottage boiler made by the II. B. Smith Company, Westfield, Mass., has made it necessary to prepare three new sizes, the largest to carry 800 feet of radiation. One of this size has just been put in their showroom on Centre street, New York.

CHAS. S. WALTHER, vice-president and manager of the Nisgara Radiator Company, Buffalo, N. Y., was one of the visitors to the heating trade in New York City this week.

## Trenton Pottery Strike Settled.

After a shut down of more than six months, the difficulties that have caused a suspension of work in the large pottery center at Trenton, N. J., have heen adjusted through the intervention of Senator Smith of New Jersey, and the works will, it is said, be atarted up again at cnce. When the potteries closed, on January 1, the manufacturers offered a reduced scale of from 25 to 40 per cent., which the men refused. In accordance with the request of the manufacturers, Senator Smith was induced to interest himself as a mediator between them and their operatives, and on July 11 a committee from both sides fully discussed the matter in the Senator's presence at Washington with the result that the manufacturers agreed to start up if the men would accept a reduction of 12½ per cent, in their wages. This proposal was accepted. The manufacturing potters of Ohio and Pennsylvania where the same controversy had closed the works were not represented at the meeting, but it is believed that they will be influenced by the action taken, and that a settlement of the troubles on a similar basis will have the result of opening all the closed potteries in those States.

In an address delivered by Governor Northen of Georgia, at the opening of the Augusta Exposition, he stated that the agricultural products of the Southern States, exclusive of cotton, for the past ten years, will average more than \$1,000,000,000 yearly, or a total of \$10,669,000,000. The products which yielded this vast sum are corn, \$300,000,000; wheat, \$49,000,000; oats, 35,000,000; tobacco, \$36,000,000; sugar and molasses, \$36,000,000; rice, \$9,000,000; hay, \$2,500,000; potatoes, \$19,000,000, and other crops, \$185,000,000, making the enormous total of over \$10,000,000,000. The figures he mentioned were authoritative, having been obtained from official sources in Washington.

Borings have been begun for the purpose of determining proper locations for the piers of the New York and New Jersey Bridge. Charles B. Brush is the engineer in charge of this work.

# PLUMBING and GAS FITTING.

The Committees of the Na-1 tional Association of Master Plumbers.

The following have been announced as members of the different committees of the National Association of Master Plumbers appointed by President John Mitchell:

#### EXECUTIVE COMMITTEE.

John Mitchell, 113 Hudson street,

New York.
L. B. Cross, 1212 Main street, Kansas City, Mo.
H. J. Pattison, 258 West Eighteenth street, New York City.
W. E. Goodman, 444 E. Water street, Milwaukee, Wis.
D. G. Finnerty, 478 Boylston street.

D. G. Finnerty, 478 Boylston street, Boston.

James Meathe, 73 Shelby street, De-

troit, Mich.

Henry G Gabsy, 892 Third avenue,
New York.

John Trainor, 307 Mosher street,
Baltimore, Md.

C. C. Dawstoe, 290 Seneca street,

Cleveland.

Paul Redieske, 99 Claybourn avenue, Chicago.

## APPRENTICESHIP COMMITTEE.

Thos. II. Radcliffe, 846 Fulton street, Brooklyn.

Wm. J. Gault, 509 DeKalb avenue,

Brooklyn. Geo. B. Lewis, 660 Fulton atreet, Brooklyn.

#### ESSAY COMMITTEE.

Jeremiah Sheehan, 1717 Washington avenue, St. Louis.

Thos. Cantwell, 1004 Olive street, St. Louis

Frederick Abel, 909 N. Sixth street, St. Louis. John F. Reardon, 3841 Finney ave-

nue, St. Louis. F. R. O'Neil, 904 Pine street, St.

Louis.

## LEGISLATIVE COMMITTEE.

Jos. R Quinter, 1414 Rhode Island avenue, Washington, D. C. T. V. Noonan, 1128 Fifteenth street,

N. W., Washington, D. C.
James Ragan, 1503 Pennsylvania avenue, N. W., Washington, D. C.
Wm. Reynolds, 1728 Pennsylvania avenue, N. W., Washington, D. C.

James Cunningham, 930 S street, N. W., Washington, D. C.

### SANITARY COMMITTEE.

Jno. L. E. Firmen, 1236 Valencia street, San Francisco, Cal.

Jno. B. Butterworth, 1809 Polk street. San Francisco, Cal. James McGivney, 665 Franklin street,

Oakland, Cal. Jno. Crimmins, 624, South Spring street, Los Angeles, Cal. L. Scholes, 262 South Los Angeles

street, Los Angeles, Cal.

E. Hostetter, at 509, and Terry Bros., at 511 Thirty ninth street, Chicago, sustained a slight loss in their plumbing shops from a fire in the block.

## Gas and Gas Fitting.—III.\*

BY J. W. HUGHES.

The Distribution of Gas from the Gas Holder through the Town.

Having our completed gas works with holders full of gas, the next question is to get it to the consumer. this purpose it is necessary to lay the mains or pipes under the streets. As these articles are specially intended for the gas fitter, as best known to the genersl public-viz., the man who introduces the pipes into the houses and puts up the gasaliers and brackets-it will not be necessary to go into the general details of the various processes used in the laying of large street main pipes, but simply give a general idea of them so as not to break the continuity of the

subject. The first care of workmen employed in the fitting of gas pipes, or any work that may bring them into immediate contact with gas, must be for their own bodily welfare (health). Gas of any kind if breathed into the lungs is a deadly poison, some kinds of gas being more deadly in their effects than others, but the danger is ever present and dif-fers only in degree. A workman who is compelled to work for any time where it is impossible to avoid inhaling gas should take such precautions as may be within his power to reduce the danger of suffocation to a minimum. joint and fitting should be tested before attempting to put them together in an excavation, or any other place where a final connection may have to be made with gas turned on, as it generally is. A short time ago in the city where the writer lives an old employee of the gas company lost his life for want of such precaution. A bolt he had to acrew up was too short or had some defect in the screw thread that compelled him to work longer than would otherwise have been necessary over a large escape of gas, resulting in his being overcome to auch an extent that he died. There should always be an intelligent helper at hand in case of accident to afford immediate assistance, and the work-man, the moment he begins to feel the least giddy, or confused, should go away from where the air is impregnated with gas, preferably out into the open air, and fill and empty his lunga by inhaling all the fresh air he can and rapidly breathing it out again, repeating the operation for a number of times. And it is not safe after once being overcome, or partially so, to at once expose oneself to the gas fumes, but a considerable interval of time (several hours) should elapse before so doing. any one is overcome by gas the usual means taken for his recovery are the same as for one smothered from any other cause, the details of which will be given later.

The mains leaving the gasometer are usually made of cast iron of such size as the magnitude of the work may call for, and are laid in trenches, suitable valves

being fitted in the vicinity of the gasom eter for stopping off and controlling Gas regulator valves for the the gas. proper adjustment and maintenance of the pressure are also frequently used. It is customary in well managed gas works to first earry the gas to what is known as the station meter, which serves to measure the same and keep a record of the consumption. In laying mains care must be taken to so grade them to certain points that any moisture that may accumulate in the pipes will run to a place provided for the collection of the same, called a siphou. This is so fitted that a pipe from it comes to the surface of the ground, to which, from time to time as may be necessary, a pump is attached and the accumulated liquid (gas water) pumped out. This is carefully saved and from it are derived certain substances of commercial value.

There are various kinds of joints used in putting gas mains together, the ordinary calked lead joint, Fig. 2, made by driving oakum into the hub or large end of the pipe and afterward running in molten lead which is set or wedged tight with the calking tool, Fig. 3, being one common kind of joint. Another is made by a similar arrangement of the ends of the pipe, but the space is filled with oakum, soaked in a mixture of red lead and oil, and a third, Fig. 4, is made by having the ends of the pipe so arranged that they make a close fit and the spigot end of the pipe, being well painted with red lead, is simply driven into the hub, that is made to correspond with a fair amount of exactness. Where wrought iron pipes are used the ordinary screw thread is employed, which is put together with red lead and screwed up with tongs.

Referring again to Fig. 2, A is the large end of the pipe, called the hub or socket; B, the small end, called the apigot; C, oakum driven in with the calking tool; D, lead poured in hot and afterward calked or driven tightly home with a calking tool. The calking tool for driving in the oakum is shown in Fig. 5. The different calking tools vary in shape, size and length, accord-

ing to the work to be done.

The quantity of lead to be used in making a joint of course varies with the size of the pipes. A rule is 1 pound of lead for each inch of diameter of pipe, or 4-inch joint 4 pounds of lead. and so on; but common sense and brains have to be exercised in this as in all other matters. It is safe to say that the pipe layer must leave enough apace for lead above the oakum to insure a solid body of lead being in the hub. A thin skin on top of the oakum is not a lead joint, but only the skeleton of one. No special skill is required in making leaded joints when the joint to be made is upright so that the lead can easily be poured into the hub, care being taken to drive the oakum home hard to prevent the lead running into the pipe. It is next in order to pour in the lead. It should be hot enough to run freely, but not red hot, and a sufficiently large pot or pouring ladle should be used to enable the joint to be made with one pouring—that is, a good joint is not made if the space to be

<sup>\*</sup> Copyrighted, 1894, by David Williams.

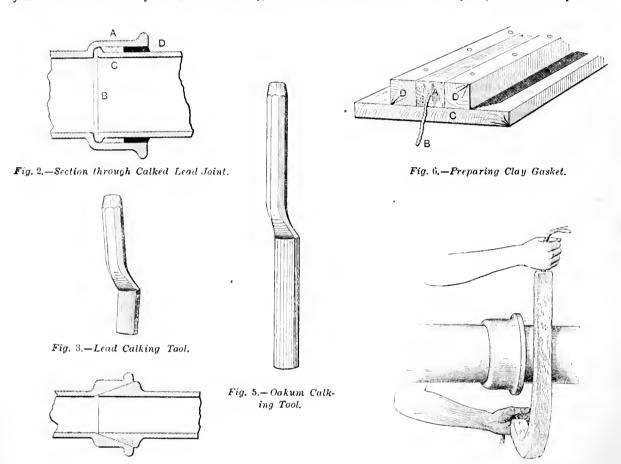

filled by the lead is only partially filled on the first pouring, and the operation has to be completed by a second.

When the lead has cooled it is calked by means of the calking tool and ham mer, care being taken not to split the hub, which can easily be done if too large a hammer is used or too violent a blow is struck What are called "slugging" blows must not be used, but a succession of solid taps sufficient to fully expand the lead and make the joint tight and no more is what is required. Making hub and spigot joints with red lead and oakum is a similar process to the one just described, except that the joint is made tight without the use of lead. The method of putting together pipes with the fitted joint will be understood by an examina-

1½ inches square. The distance these strips are placed apart corresponds to the size of the desired gasket. The space formed by the two strips and the board to which they are nailed forms two sides and the bottom of a trough, or gutter. Work in the clay, putting into the center of it a piece of strong string several inches longer than the clay, to keep it together, as in Fig. 6. The wood must be kept well moistened and the clay be of such a consistency that it will hold together, about the same consistency as ordinary glaziers' putty, which material, by the way, is frequently used for the purpose when small joints are to be made.

Having worked the clay well down into the groove and smoothed it off on the top, take hold of the two ends of

the gasket and calk tight, as before described. A little practice is, of course, required to get into what is called the hang of it, but the operation is a simple Again, a word of caution. Great care must be taken before forming a lead joint that there is no water or moisture in the joint. If there is, the lead will be violently blown out and the workman is likely to have to lay upfor repairs, and if he escapes with his eyesight uninjured he will be fortunate. Where joints have stood in the rain any time with only the oakum in them, it is safest, and therefore best, to remove the oakum and calk in fresh. But the better plan is not to let joints stand, but finish them at once if possible. Where a joint is doubtful on the moisture point, a little tallow put into it has

GAS AND GAS FITTING.

tion of Fig. 4. It is sometimes called the stopper joint, it being similar to the stopper in a glass bottle.

Fig. 4.—Stopper Joint.

When leaded joints have to be made in a horizontal position a special mode of procedure is required, differing somewhat from that employed in making an upright joint, the special features having reference to the method employed in introducing the molten lead. To do this it is necessary to use what is called a "clay gasket," although there are now in the market special gaskets made for the purpose. To prepare the clay gasket, take a sufficient quantity of ordinary clay, well puddled (mixed). Have prepared a piece of flat board of sufficient length for the purpose—vlz., long enough to make a gasket on that will completely encircle the pipe. To this nail two strips of wood of a size to suit the gasket to be made, which varies according to the size of the joint, but is usually about

the string projecting from the clay and lift the gasket out of the gutter. Pass one end of it under the pipe, as in Fig. 7, bringing it around on the opposite side to the top of the pipe, Fig. 8, where cross the two ends of the gasket so that a small cup or "pour hole' will be on top of the pipe. Keep one angle of the gasket against the opening of the joint, being careful not to work the clay into the joint, and see that it firmly adheres to the pipe. This is best done by rubbing it with the hand well moistened just before the lead is ready to pour, the object being to have the clay sufficiently tirm to resist the weight of the lead while in the molten state.

Next pour in the lead by the pour hole, and as soon as it has set remove the gasket, trim off the projecting piece that has been left at the joining point, trim off with a sharp chisel any inequalities caused by the non-fitting of

a quieting effect. Always pour from the back of the joint—that is, away from the opening—and keep the head away from the line the lead will take if violently blown out.

Fig. 7 .- Putting Gasket Around Pipe.

Referring to Fig. 6, A is the clay forced into space formed by bottem board C and strips D D nailed on to it; B is the string projecting from the clay.

Fig. 7 is a sketch of the gasket held in the hand by the string just previous to passing it around the pipe, showing one hand holding the gasket up, while the other, passed under the pipe, has caught the string of the lower end in order to draw the gasket around the pipe.

pipe.

Fig. 8 shows the position of the gasket after it has been passed under the pipe and just before turning down on top of the pipe to form the pour hole. In doing this the workman sits astride of the pipe, back of, and facing toward, the rear part of the hub.

The pour hole is formed by keeping the two ends of the gasket away from the face of the hub for 1 inch or 2 inches on the top, then laying them down on the pipe and working a suitable sized and shaped aperture into which the lead can conveniently be poured. One angle of the gasket fits against the aperture in the joint which is to receive the lead, and if nicely adjusted, when the gasket is taken off the joint will be found filled flush and even, and no trimming will be required except the removal of the plece that has filled the pouring hole.

In trenching there has to be made at proper intervals a depression or recessed part in the bottom of the trench, as in Fig. 9, and sometimes at the sides when large pipes are being laid, to afford space in which to perform the various operations of joint making.

Sometimes it is more convenient, especially in old work, to connect them by means of a saddle piece and bolts, as in Fig. 11, the joint between the saddle piece and main being made tight with red lead putty.

## Newark and Paterson Plumbers.

At the last meeting of the Master Plumbers' Association of Paterson, N. J., they entertained quite a large delegation from the Newark Association. The members of the Newark Association drove over to Paterson and arrived at the association hall at the close of the regular business session, when President Berla of Newark was invited to preside over the meeting. Refresh-

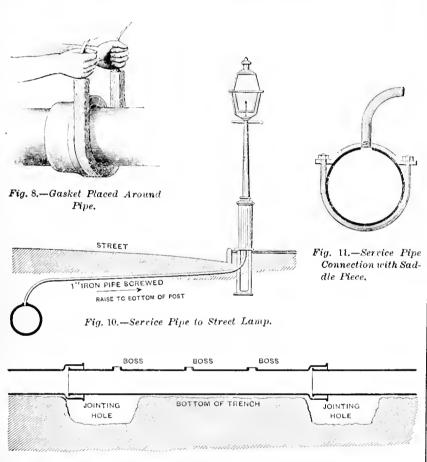

Fig. 9.-Section through Bottom of Trench.

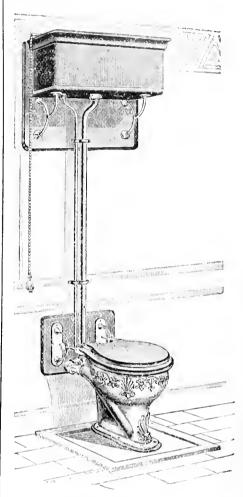

#### GAS AND GAS FITTING.

The mains are laid sufficiently below the surface to insure their freedom from injury by the weight of passing vehicles, and must be protected against shifting or disturbance, as a broken joint and a large escape of gas is a serious matter, frequently involving the loss of life and property. At the proper intervals to the mains are attached the service pipes that are to serve as means for conveying the gas to the different buildings and lamps. These are usually of wrought iron pipe with screw joints, and are connected with the mains in several ways. It is better they should be taken from the top of the main and have a decided rise from the main to the building or lamp they are to supply, as in Fig. 10. The usual method of connecting them to the mains is by means of a screwthread, a suitable hole being drilled and tapped into the main for the purpose. A boss is generally formed on the mains for this purpose.

were served and numerous ments speeches made. President John Hlckman was ably assisted by ex-Alderman Kearney in extending hospitality to their guests. Secretary Don of the Newark Association was the bearer of a present to Levi McBride, one of the Paterson delegates to the Detroit convention. It was presented with a fitting speech, and Mr. McBride with becoming modesty showed his present to all the members and visitors. The Newark plumbers took this opportunity to invite the Paterson plumbers to join them in their first annual outing to Pleasure Bay, which will take place on July 27, and by unanimous vote of all present the invitation was accepted. Invitations were also extended to the supply houses of Newark and Paterson, and representatives from some New York houses are expected to join the party, which leaves Newark at 7.30 a.m. to take the steamer at New York.

#### The Lucania Water Closet.

The Pierce, Butler & Pierce Mfg. Company, Syracuse, N. Y., are offering the trade their latest production 11 water closets, known as the Lucania, a general view of which is shown in the accompanying illustration. It is an improved siphon jet closet, carefully constructed and thoroughly tested. The

The Lucania Water Closet.

manufacturers furnish a tank made expressly for the closet, which is of ample size to thoroughly flush it, the ball cock being practically noiseless, and all the trimmings of the best materials and workmanship. The Lucania closet is made in four different combinations at varying prices, the finish being ash, cherry and oak. The No. 1 combination includes an embossed Lucania siphon jet closet, with round cornered tank and board seat with cover, back and solid brass adjustable brackets, solid brass tank brackets, flush and supply pipes, straps, offsets and bolts, all nickel plated, as shown in the cut, without marble floor slab.

New Plate olass show windows and a fine display of modern plumbing fixtures, a handsome show of gas chandeliers and fixtures and a variety of steam, hot air and hot water heaters, gas, gasoline and oil stoves and a line of stoves, refrigerators, tinware and house furnishing goods show the enterprise of Curtiss & Pierpont at New Haven, Conn. Their increasing business made larger quarters necessary and their recent opening presented many attractions.

LAWRENCE TROTTER and EDGAR BUCK, practical plumbers, formerly with

Forney Bres., have entered into part. nership and have opened a shop at 1714 Eleventh avenue, Altoona, Pa.

### OBITUARY.

BENJAMIN DOUGLAS.

We give herewith a portrait of the Hon. Benjamin Douglas, president of the the corporation of W. & B. Douglas, Middletown, Conn., whose death was noted in our last issue. Mr. Douglas died on Tuesday, 26th ult.

Mr. Douglas was bern at Northford, Conn., April 3, 1816, of Scotch ancestry, and was therefore in his seventy-ninth year at the time of his death. His father was a farmer, whose ancestors were among the earliest settlers fors were among the earliest settlers of New England, as his grandfather was Col. William Douglas, an officer in a New Haven regiment of the Revolutionary War. He acquired the rudinents of his education by a few months' attendance at the district school during the winter while a led months attendance at the district school during the winter while a lad and by extensive reading. Like all farmers sons, he spent his summers working on the farm. When 16 years of age, or in 1832, he came to Middletown and ap-

prenticed himself to a machinist. In 1839 he joined his brother William, who in 1832 had with W. H. Guild established a machine shop.

For three years they carried on the business of an ordinary foundry and machine shop, manufacturing hydraulic rams and pumps. From the inven-tion in 1842 of the celebrated tion in 1842 of the celebrated revolving stand pump, the success of this firm was established. Year after year the business increased until the name of W. & B. Douglas was known the whole world over. The corporation have had a house in New York City for the past 50 years, and their Chicago branch was established some 20 years ago.

Mr. Douglas always attended

Mr. Douglas always attended strictly to his business until his health prevented it, and since then has almost daily been driven down to the factory which he founded. He also found time to devote to public enterprises and works of be-nevelence. He became early in life an earnest friend of the

colored people, and when the war broke out he was prominent among his fellow citizens in the support of

the Government.
Mr. Douglas filled many positions of honer and trust in the city and State. He was Mayor of Middletown from 1849 to 1855, and a member of the General Assembly in 1854. While in the Legislature he was known for his broad and progressive views and his businesslike manner in caring for the State's interests. In politics Mr. Douglas was a Republican, having been a delegate at the convention which nominated Fremont and one of the Presidential electors when Lincoln was chosen President in 1860. He also served as Lieutenant - Governor of Connecticut in 1861. He was a member of the Board of Education for many years, and helped to establish the schools on their present broad

Mr. Douglas united with the Congregational Church in Northford in 1831 by profession of faith, and joined the South Church in Middletown by letter in 1832. He was for many years its Sunday school superintendent and was a deacon for nearly 40 years.

Mr. Douglas was a director in the

Middletown Gas Company and the Air Line Railroad and a director and large stockholder in the People's Fire Insurance Company. He was the first president of the First National Bank, and continued to hold that office until Hon. John N. Camp was elected, since Hon. John N. Camp was elected, since which time he was a director. He was also for years president of the Farmers and Mechanics' Savings Bank, and was for 26 years president of the Middletown Bible Society. He was also for many years a trustee of Wesleyan University, and was at his death a trustee of the Connecticut Hospital for the Insane. On his twenty-second birthday, April 3, 1838, he married Mary Adeline, daughter of Elias and Grace Totten Mansfield Parker, and a niece of Major-General Joseph K. Mansfield. She died June 24, 1885. Mansfield. She died June 24, 1885. Mansfield. She died June 24, 1885. There were six children, of whom three survive—John Mansfield, born in Norwich; William and Benjamin, Jr. Three children have died—Sarah Kirtland, September 21, 1841; Benjamin, December 18, 1843, and Edward who died in Paris, May 22, 1889.

Mr. Douglas was a pioneer in the manufacturing field, and occupied

BENJAMIN DOUGLAS.

from the outset a very preminent position as one of the feremest and most successful of American manufacturers. The worldwide reputation and standing which the house of which he was the founder enjoys is a noble tribute to his industry, perseverance, zeal and integrity.

The story of his life is the story of one who by his perseverance, indomitable will and Christian character, attained a large measure of success, exerted a wide influence for good and had the confidence and esteem of every

one who knew him.

## TRAPS AND VENTS.

THE LOWELL HEATING & PLUMBING COMPANY, Lowell, Mass., of which D. W. Mullin, formerly with D. H. Wilson & Co., is manager, have epened a place of business at 43 East Pine street and are ready to receive orders for plumbing, steam heating, gas fitting, &c.

IN HEB BOOK, "Women, Plumbers and Dectors," Mrs. H. M. Plunkett says: "If wemen and plumbers do their

whole sanitary duty, there will be comparatively little occasion for the services of the doctors." She claims no originality in the book, because "sanitary science is a science of cellated facts."

FAY & FAHERITY will open a plumbing shop in Windsor Locks, Conn.

E. GRIFFITH is erecting a new plumbing shop at 7 Tichener street, New-

GEORGE S. O'NEILL, a plumber, steam and gas fitter, has gone into business at 57 Godwin street, Paterson, N. J.

THE LICENSES GRANTED to two Jersey City, N. J., plumbers have been rescinded because they dld not file their bonds with the proper officer.

ZALMON GOODSELL was one of the speakers at the Newton, Conn., Fourth of July celebration.

THOS. KELLY & BROS., manufacturers and patentees of Kelly's self acting water closets, noiseless water closets. self acting urinals, step and waste ceck

and sanitary wash basin, 123 Franklin street, Chicago, have issued an interesting circular addressed to architects and the plumbing trade. After referring to the fact that they depend exclusively on honorable methods of advertising to recommend their goods and empley ne unscrupulous parties to decry the goods of other makers, the attentien of the reader is called te a large number of testimonials of the Kelly line of plumbing specialties. The chief sanitary inspectors of Chicago and Buffalo contribute strong statements in their favor, while plumbers and owners from the Atlantic to the Pacific express their complete satisfaction. The testimenials cover hotels, schools and other places of frequent use, as well as private families. The frest proof closets particulate results in the control of t ticularly come in for a large share of praise.

THE UNION HEATER SUPPLY COMPANY, Detroit, Mich., are improving their Helper gasoline plumbers' fire pot with a brasa tank and other details to increase its usefulness. The frame

which supports the metal pet can be removed and the burner turned so as to enable the flame to be threwn against an old joint to be melted, and can be freely moved without danger of being extinguished.

HASTINGS & HARKINS is the name of a new firm who have opened up in buslness as plumbers at 115 South Rose street, Kalamazoo, Mich.

THE PARTNERSHIP existing between Peter Schneider and U. J. Stoltz, Murphysbore, Ill., as the City Plumbing Company and U. J. Stoltz & Co., has been disselved. The business will be centinued by Peter Schneider.

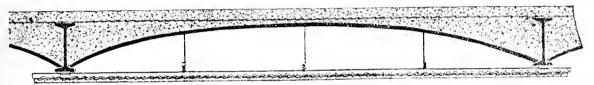

LEWIS & WILSON have moved their plumbing establishment to 819 Wood street, Wilkinsburg, Pa., where they make a fine display of baths and lavatories connected with the water supply, se that they can be shown as used. They also show a varied line of cooking stoves and gas ranges, making a specialty of the Favorite line of gas goods. They are engaged on some plumbing work that is said to be the finest in their city.

## ROOFING AND CORNICE.

## Instruction in Roofing and Cornice Work.

It has been decided by the management of the New York Trade School to establish next season a class for instruction in roofing and cornice work. demand for such a class has been felt for some time, but it is only now that the trustees have seen their way to adding another to the increasing lists of trades taught. It is believed that the opportunity offered in this class will be much appreciated by the younger members of the trade. The New York Association of Master Roofers and Manufacturers in Sheet Metals have signified their willingness to co-operate in the matter, and they will appoint a trade school committee for the supervision of the work of the class, similar to those appointed by the associations of master plumbers, master painters, master stone cutters,

to 8 feet apart, according to the weight the floor is to sustain. In setting these arches the channel sides are placed upward, the proper curve being given to the iron by machinery especially adapted to the purpose. Between the channel irons are placed wood centerings in such a way as to leave the channel arches and I-beams exposed. These arched ribs or haunches are first filled with concrete, after which expanded metal is laid across the arches and covering the false floor. Above these concrete is placed to the thickness required. As soon as the concrete is set the false floor and all other wood work is removed from underneath, this leaving a system of steel and concrete arches and flats of concrete, having embedded in their underside a continuous layer of expanded metal. In constructing the floors of a building this scheme is continued block by block until the entire interesting to receive a catalogue of sheet metal goods from such a far distant city. In presenting this catalogue to the trade the E. K. Dillingham Iron Company mention that they have gone into the manufacture of sheet metal goods on a larger scale than has heretofore been attempted in Texas, and feel confident that the trade of their State will patronize the home enterprise. Among the specialties they mention are round beaded galvanized steel eave troughs in 10-foot sections and galvanized steel conductor pipes in lengths. The concern are equipped with machinery for curving corrugated iron for awnings, arches, &c., and have acquired the exclusive right to manufacture and sell Harry's patent galvanized corrugated iron cisterns and windmill tanks in Southern Texas. They refer to their excellent facilities for turning out all kinds of

Expanded Metal for Floors and Ceilings.—Sectional View, Showing Method of Construction.

&c. The class will be a day one. It will commence work on January 2, 1895, and will have a course of three months. The course of instruction is not yet definitely decided upon. It will, however, he confined to work directly connected with the roofing and cornice trade, and will probably embrace the laying of simple roofing of varlous kinds, making and lining of gutters, making rain water leaders, chimney caps, ventilating caps and window caps, with other practical roofing work, together with simple and fancy cornice work. It is also proposed to include pattern drawing and cutting, so far as applies to the roofing trade. Any information in regard to the class may be obtained by application to the New York Trade School, First avenue, Sixty-seventh and Sixty-eighth streets, New York city.

## Expanded Metal for Floors and Ceilings.

Among the many uses to which expanded metal has been put, one of the most recent is its introduction into the construction of floors and ceilings of buildings, both large and small. It is referred to as an improved fire proof system, and has received the approval of many departments of buildings, as well as of architects, builders and contractors, who have examined into the merits claimed for it by the Expanded Metal Fire Proof Construction Company of 107 Chambers and 91 Reade streets, New York City. The arch and floor construction, in which expanded metal plates form an important part, may briefly be described as follows: Between the I-beams of a building channel iron arches are placed from 3

work is finished. The company state that floors can be made to stand any desired load by simply increasing or diminishing the number or weight of the steel arches and concrete. The srched steel channels and expanded metal furnish the foundation and bond for the concrete, thus combining lightness with great strength. The claim is made that tests performed by Prof. J. B. Johnson in the Washington University, St. Louis, Mo., demonstrated the fact that the carrying strength of a concrete slab 2½ inches thick was increased ten times by the use of a single layer of expanded metal.

The improved fire proof system of the company also provides for the finish of the floor arches, with or without suspended ceilings. When the ceiling is put upon the arch all the iron work is covered with expanded metal lathing, the ceiling consisting of tightly drawn furring atrips secured to I-beams and arches and covered with expanded metal lath ready for plastering. The claim is made that ceilings thus constructed will not crack and are free from stains, beside double fire proofing the floor arches above. The sectional view which we present herewith shows the manner of constructing the floor arches, and also of putting up the suspended ceiling.

#### FLASHINGS.

PAUL F. WEBER has opened a shop at 447 North Third street, Philadelphia, to do a general sheet iron, tinning and roofing business. He has worked for a long time for the J. S. Thorn Company.

THE E. K. DILLINGHAM IRON COMPANY, Houston, Texas, issue their first annual catalogue and price list. It is

cornice work. The catalogue illustrates and gives prices and tables of dimensions of the goods enumerated. A page in the pamphlet is given up to Kernan warm air furnaces, for which the E. K. Dillingham Iron Company are agents.

BERGER BROS. of Philadelphia make the statement that trade within the last two years has increased beyond their highest expectations, the panic year heing the best year they ever experienced both as to the amount of sales and profits. With the present low cost of producing supplies in their line and their facilities for handling goods in large quantities they look for a still larger trade in the future. Besides handling a general line of tinners' and roofers' supplies the firm carry an immense stock of tinners' hardware, covering almost everything in that line. They have just issued an 1894 edition of their catalogue and are sending copies to all who will take the trouble to make application for them.

THE GLOBE VENTILATOR COMPANY, Troy, N. Y., distribute neat circulars relating to the Globe ventilators of their manufacture. The folder refers to the ventilator, gives descriptions and illustrations of it, presents a few testimonial letters and shows an engraving of a residence at Lansingburg, N. Y., upon which these ventilators are used.

THE KNISELY & YELDHAM COMPANY, 68 to 74 West Monroe street, Chicago, are to furnish the copper, slate and tin work for the residence of Mrs. Periolat, Serf street, near Sheridan Drive.

Reports given by the Northwestern Lumberman indicate a serious shortage, amounting to billions of feet in the Northwestern pine region.

# TIM PLATES,

## Freight Discrimination against American Tin Plate.

We have received the following letter from Clarence R. Britton, secretary Britton Rolling Mill Company and the Cleve aud Tin Pla e Company:

"I have noticed in the last few issues of *The Metal Worker* several articles on discrimination in freight rates. I wish to call your attention to the discrimination of the American railroads against the American tin plate manufacturers. Inclosed you will find two circulars, one from the largest tin plate handlers in Wales and the other from a large importing house in New York. From this you will see that the rate on tin plates per 100 pounds from New York to Cleveland is 9.3 cents. Our rate to New York is 18 cents. The rates to St. Louis, Chicago, Cincinnati, &c., are less than Cleveland rates to these points. We have called the attention of the freight agents to this matter, but all the answer we get is that it is a "shame."

"It seems to us that the railroads are blind to their best interests. As it is, they obtain not over 200,000 tons of tin plate freight, for at least a third of the amount consumed is used on the Atlantic Ccast. If we manufactured all our plates they get not only freight on the finished articles, but on all the raw materials, which will be at least 2,000,000 tons, taking in iron ore, coal, steel, lumber for Wayand the sid of the lumber, &c. We need the aid of the railroads. We would not care about bringing our rates down to those of the importers if they would only bring their rates up to ours. All we want is to be on somewhat of an equal basis."

The circulars referred to by our correspondent contain figures of cost of delivery at a number of points above quotations given f.o.b. cars New York, Philadelphia or Baltimore. They cover 108 pound, 100 pound, 95-pound and 90 pound boxes. We choose as examples the figures on 100-pound boxes given below.

From the circular of C. S. Trench & Co., New York, March 14, 1894:

"For delivery at the following points the extra cost over the above offers made for import would be:"

Per box,	100 lb.	Per box,	100 lb.
$14 \times 20$ .	Cents.	14 x 20.	Cents.
Boston	6	Milwaukee	15
Buffalo	9	Minneapolis.	36
Chicago		Nashville	
Cincinnati		New Orlean

#### SCRAP.

GORSEMON TIN PLATE WORKS, near Swansea, Wales, were, on June 26, the scene of a serious riot. Three hundred tin plate strikers endeavored to prevent the workmen from starting the mills in opposition to the orders of the labor union. The police interfered to protect the workmen and a conflict ensued, in which many on both sides were severely injured. The Gorsemon Mills had been idle for some months, owing to a dispute as to the output. were restarted with workmen agreed to make 40 boxes a shift.

THE Cleveland Leader reports that the town of New Lisbon, Ohio, has been selected for the erection of a large tin mill by a newly formed company.

THE SETTLEMENT of the tin plate wage scale at Pittsburgh was followed by the full resumption of work-which had been temporarily suspended pending the conference-st the large tin Ing the conference—at the large the plate mills of Wallace Banfield & Co., Irondale. Ohio; American Tin Plate Company, Elwood, Ind.; United States Iron and Tin Plate Mfg. Company, Demmler, Pa., and others.

THE BLACK SHEET MILLS of the New Philadelphia Iron & Steel Company, New Philadelphia, Ohio, and those of the Falcon Iron & Nail Company, Niles, Ohio, resumed operations on Monday, on the settlement of the tin plate wage scale.

A CERTIFICATE OF INCORPORATION WAS issued at Columbus, Ohio, last week to the Morton Tin Plate Company, Cambridge, Ohio, who will immediately commence building black plate mills. At a subsequent meeting of the stockholders John W. Marquand, Charles L. Campbell, John C. Becket, John C. Morton and A. Beard were elected di-Morton and A. Beard were elected directors. The officers of the company are John W. Marquand, president; Chas. L. Campbell, vice-president; John C. Becket, secretary and treasurer; A. Beard, general manager. The plant will be located at Cambridge, at the junction of the Baltimore & Ohlo and Cleveland & Marietta railroads. The Cleveland & Marietta railroads. The buildings will be constructed of iron and steel. Modern machinery and appliances will be used. It is expected that tinning pots will be added to the plant later on.

BRITISH TIN PLATE EXPORTS still exarch 30, 1894:

"For delivery at the following points last year. The total foreign shipments

Britain in the month of June were only 25,000 tons, as against 37,000 tons in June, 1893.

PEDEN & Co., tin plate importers, iron merchants and jobbers, of Houston, Texas, announce by circular that R. P. Smith, who retired from the firm of Smith, Peden & Co. on May 1, had no moneyed interest in the firm, which is continued by the remaining partners, D. D. Peden and E. A. Peden.

THEOPHILUS D. MORGAN has tendered his resignation as superintendent of the New Philadelphia, Ohio, Iron & Steel Company, and will be succeeded by Jacob James, formerly superintendent of the Arethusa Iron Works, New Castle, Pa. Mr. Morgan contemplates entering into the manufacture of black plates for tinning purposes.

MERRY & CLARK, 535-547 West Fifteenth street, New York, advise us that their special brands of tin plates, known under the names Merry's Old Method, Monarch and Merry's Lion, have had a large sale among architects, builders and the trade in general, and numerous testimonials of them have been received, speaking in high terms of their excellent qualities. During the dull season, we understand, their trade has continued good, their orders up to July 1 having exceeded those of a year ago.

JENNINOS BROS. & Co., Leechburg, Pa., have announced their decision to start their sheet mills as a non-union establishment. The firm do not anticipate any trouble in making the change. Several of their old hands are willing to return as individuals, and a large number of workmen have been obtained from Apollo. The starting of this plant on a non union basis makes every plant in the Kiskiminetas Valley except one independent of the Amslgamated Association.

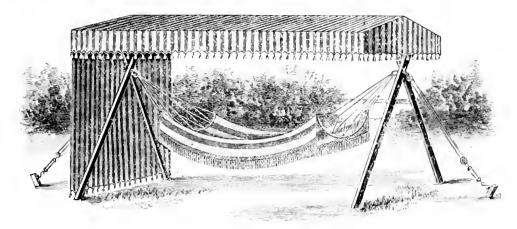

PHIL. R. JENNINGS of the firm of Saturday, by the "Campania," from a two months' tour in England and the Continent of Europe. In the course of his travels Mr. Jennings visited the South Wales tin plate districts and obtained a good insight into the condition of affairs there. He describes general trade in England as being fully equal in point of depression to that of this country.

The work of demolishing the World's Fair buildings at Chicago was expedited by a destructive fire on the evening of the 5th inst. It broke out in the Terminal Building and spread to the Administration, Mines and Mining, Elec-tricity, Machinery, Agricultural and Manufactures buildings, inclosing what was known as the Court of Honor. Some of these buildings were not completcly destroyed, but not much was left of most of them but shapeless masses of distorted steel frame work and charred timbers. The buildings belong to the Columbian Exposition Salvage Company, who have for some time been engaged in the work of tearing them down and disposing of the material.

## THE RETAIL STORE.

### Excelsior Hammock Swing.

The accompanying illustration representa a hammock swing put on the market by the American Roofing Company, 15-17 Public Landing, Cincinnati, Ohio. The roof frame is composed of two light iron rods at the outer edges and apex and a central bar of oak. It order for a few cakes, resulting, it is explained, in a great saving of gas. The goods are made in four sizes, as fellows: No. 1, 3 griddles with a capacity of 18 cakes at one time; No. 2, 3 griddles with a capacity of 24 cakes at one time; No. 3, 2 griddles with a capacity of 12 cakes, and a welle iron with 8 cakes, and No. 4, 2 griddles The manufacturers claim that the vise is simple in construction, durable and effective; that it is light and easily carried with other tools; that the form is such that it can be readily attached to a post or any convenient place, and that it will hold brass or iron pipe with the greatest firmness without the slightest injury. The vise is made in sizes Nos. 1,

Excelsior Hammock Swing.

is explained that the device can be knocked down in a small space for shipping; that it requires but a few moments to set up in position, and that when in position it is perfectly rigid.

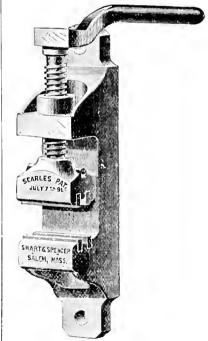

The point is made that the awing makes a handsome appearance, and that it is an ornament to the premises; that it can be converted into a tent by adding side curtains, and that where lawn space is not available the swing can be set on a veranda or porch. The swing is sold complete with one end curtain. Extra curtains for the end and sides, and hammecks in a variety of styles are furnished as desired.

### Gas Cake Griddle.

The Stuart & Peterson Company, Burlington, N. J., are offering gas with a capacity of 16 cakes, and a wifile iron with 8 cakes.

### Searle's Pipe Vise.

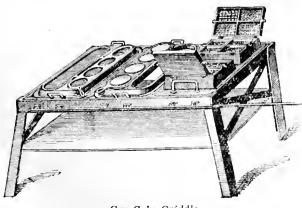

The accompanying cut represents a pipe vise put on the market by Smart & Spencer, Salem, Mass. The vise is described as having a body of cast iron, a screw of steel and four gripping jaws of the very best tool steel, which are reversible, thereby allowing all the edges of each jaw to be used. The point is made that when the jaws become dull from constant use they may be easily sharpened, or they may be renewed at a slight cost, thus making the vise almost indestructible. In the No. 2 vise the jaws are 2 inches long, thus giving a bearing on the pipe of 8 inches, and re2 and 3. No. 1 holds from 1 to 1 inch iron pipe, No. 2 from 1 to 1 inch iron

Searle's Pipe Vise.

pipe and No. 3 from \$ to 2 inch iron pipe.

The return from Washington to their homes—so far as they possess them—of the members of the various "industrial armies," is taking place with more or less speed. The retreat of the Commonwealers is not always "in good order," and many complaints are made in regard to their presence along the different lines of march.

Gas Cake Griddle.

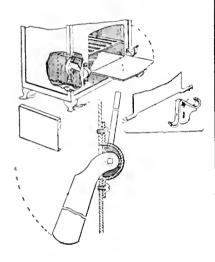

cake griddles, as illustrated in the accompanying cut. Each griddle and waffle iron ia controlled by an independent burner, so that it is not necessary to heat the entire frame to fill and sary to heat the entire frame to fill an

quiring, it is atated, but very little pressure to hold firmly the smoothest pipe. It is remarked that the jaws are diametrically opposite and that the strain on all four edges of the jaws is equal.

## STOVE TRADE NOTES.

Improvement in Oven Doors.

The Portsmouth Stove & Range Company, Portsmouth, Ohio, are introducing in connection with some of their goods an improvement in oven door construction, which is illustrated herewith. The idea is to prevent the disagreeable noise which usually ensnes when a drop oven door is thrown down and falls upon its supports. The arrangement is such that the door is automatically retained in a closed position without the aid of a latch, while an improved form of pedal or tumbler permits the door to be readily opened or closed at pleasure by means of the foot. The illustrations which we present represent the improvement and the manner in which it operates. The upper portion

Improvement in Stove Oven Doors.—Cut Showing the Various Parts.

of the cut shows a part of a stove with the oven door dropped into position and a portion of the casing of the stove broken away, so as to make clear the position of the counterbalancing arm. The extremity of one of the trunnions on which the door awings is squared and fitted in a corresponding opening in the outer end of a swinging arm designed to counterbalance the door. The bracket is recessed for this counterbalancing arm, and it is thus prevented from becoming disengaged from the trunnion. An adjustable friction spring is attached to the side of the oven and engages the free end of the counterbalancing arm, thus controlling the movement of the door when thrown open. The second largest portion of the cut shows an enlarged view of the counterbalancing arm or lever and its connection with the oven door. The right hand portion of the cut represents a detail of the pedal attachment or tumbler and its relation to the door, while the remaining portion of the engraving represents the casing or box, which is inserted between the oven and the outer shelf of the range and covera the counterbalancing lever with the friction apring which engages it. In operating the device, the door is

thrown open by applying the foot to the lower end of the tumbler and thrusting it backward. When the door approaches a horizontal position it overcomes the counterbalance or swinging arm, but the spring being properly adjusted engages the arm and checks the movement of the door authiciently to prevent a noisy rebound when it falls into position. In order to close the door the foot is applied to the upper end of the tumbler.

#### ODD PLATES.

THE ANSHUTZ-BRADBERRY COMPANY, Pittsburgh, Pa., send us a circular of their Tremont s'cel tubular side air blast furnaces, which states that "a blast of air is delivered in the combustion chamber just where the smoke is thickest and effects a combustion that saves fuel and gives perfect control of the fire. But this is not all. There is a large radiator, a big, heavily ribbed fire pot with asbestos packed cup joint, dust flue and a grate that is just the thing."

II. L. Mosher, with the Round Oak Stove Works, Dowagiac, Mich., spent the Fourth in New York renewing old acquaintanceships, and is now soliciting orders for goods in his line in New York State.

A LETTER RECEIVED from the Anshutz Bradberry Company, Pittaburgh, Pa., has a handsome lithograph at the top, giving the officers of the company, their Tremont trade mark and their name and address. An envelope which they inclose when an answer is desired is a pictorial history of the company. It shows the plant first occupied in 1844, their present works in Allegheuy, near a bridge across the river, a bell with the words, "long distance telephone," with their number "Manchester 47" beneath it, and the name and address in a pretty shade of blue, forming a pleasing contrast to their Tremont trade-mark, shown in a yellow tint.

W. S. FERRELL, who 28 years ago entered the foundry of the Abram Cox Stove Company, Philadelphia, to learn the molders' trade and for years has been the superintendent of their shipping department, is enjoying a vacation previous to accepting a more lucrative position with Jesse Jones & Co., manutacturers of paper boxes for hardware. On his resignation he was presented with a handsome Masonic mark by his associates.

THE BEAVER FALLS HEATING & VENTILATING COMPANY are a new concern who will establish themselves at Beaver Falls, Pa. The company will manufacture furnaces and heating and ventilating appliances. The capital stock is \$100,000.

THE LIEBRANDT & McDowell STOVE COMPANY, Philadelphia, are getting some new goods ready for the fall trade

THE LARGE WATER TANK that is used to supply the hollow ware manufacturing plant of the Stuirt & Peterson Company, Burlington, N. J., is located on the top of their highest building and

attracts wide attention. It is provided with a long handle and a cover and is painted black, so that it appears like a mammouth saucepan and can be seen at a great distance. To turn everything about a manufacturing plant to a profitable account is a long step toward a successful business.

Previous to joining the ranks of the benedicts W. E. Hopkin, superintendent of the stove repair department of F. M. Borden & Bros., Philadelphia, gave a supper to the following friends at the Delaware House: F. M. Borden, J. B. Borden, Wm. F. Habicht, Jos. McCall, C. B. Smythe, H. E. Borzell, Howard Seller, W. H. Borden, David Zelenski and Albert Brandt. At the supper his friends presented him with a handsome mosaic clock, the presentation speech being made by H. E. Borzell. The good wishes and good advice given were as abundant as was the hospitality of the host.

THE HOME STOVE COMPANY of Indianapolis have bought the plant of the Wells Mfg. Company, at Greenfield, Ind., and expected to put it in full operation last week.

Fox Furnace Company, 28 Vincent street, Cleveland, Ohio, are favoring the trade with a circular illustrating some of the leading furnaces which they manufacture. These are made under the name Fox, and are adapted for using various forms of fuel. Among the features to which special attention is invited may be mentioned double corrugated fire pot, triangular bar grate and gas tight joints. Their solid cast iron radiator furnace for soft coal is said to have but one joint above the gas ring and is thoroughly gas, smoke and dust tight.

THE CARTON FURNACE COMPANY of Utica, N. Y., make atrong claims for their soft coal amoke burning furnace, which they have lately placed on the market. It embodies the latest features, has self cleaning radiators, Smyth's triangular grate and vertical self cleaning combustion flues. It is substantial in construction, and the manufacturers expect a large demand for it.

WE HAVE RECEIVED from the Troy Nickel Works of Troy, N. Y., the first number of a publication which may properly be classed among the comic papers of the day. It is entitled Yours Truly and is published by G. L. Tyler & Son of Troy. It is full of comedies in picture and prosc, and the matter is by no means slow. The only advertisement is that of the Troy Nickel Works, this occupying the second and last pages. The merits of the Alaska goods are cleverly presented and the general make up is such that members of the trade receiving a copy of Yours Truly will be apt to keep it within convenient reach.

E. Bement & Sons of Lansing, Mich., have recently purchased all the patterns, atock, machinery and business of the Wilcox Heat-Light Company of Orand Rapids, Mich., and will now manufacture that line of oil stoves and gas radiators in their works at Lansing under

their own name. The company's line of oil stoves now includes among others the Standard, Eclipse, Challenge and Model. The superior facilities enjoyed by the company and their long experience in manufacturing insure to their customers prompt shipments.

IN ORDER to meet the demand for a first-class base heating wood stove, in which the fuel would rest on the bottom of the stove instead of upon the grate, the Michigan Stove Company have brought out the Maple Garland, possessing many features of interest. The decoration is artistic in character and the design exceedingly attractive. The constructive features include large feed door, capacious hot air circulating draft, single swing cover, heavy fire back and automatic damper. The company also call attention to the Carbon-Garland, a square parlor heater, for soft or hard coal. In this stove the grate and fire pot are about 7 inches nearer the floor than is ordinarily the case; the feed door is attached to the body of the stove instead of to the outer casing, and is fitted over tlanges, making this part of the stove, by means of a turn buckle, very tight; the grate is of the draw center pattern and the pipe collar is cast solid to the upper portion of the fire chamber. The combustion chamber is made in one piece and so constructed as to prevent smoke coming out of the feed door.

AT THE ANNUAL MEETING of the Somerset Stove Foundry Company, at Somerset, Mass., held on Monday, July 9, officers were re-elected as follows: John D. Flint, president, and William P. Hood, tressurer and manager. The Board of Directors consists of John D. Flint, Hon. Frank S. Stevens, I. T. Brownell, A. N. Lincoln, Alfred H. Hood and William P. Hood. The report of the treasurer, showing the condition of the company to be very favorable, was accepted, and it was voted to pay a dividend of 6 per cent. The sales of stoves for the past year showed a heavy falling off as compared with previous years.

Brief Mention was made in these columns July 7 of the fact that Geo. D. Hoffman, 82 Lake street, Chicago, Ill.. had been appointed general Western manager of the Craig-Reynolds Foundry Company of Dayton, Ohio, for the sale of their various furnace productions. The company now state that Mr. Hoffman is well known to the heating and ventilating engineering public as an ex-pert in that line and that he considers the series one of the most complete and extensive ever introduced, consisting as it does of over 34 sizes and seven styles, embracing furnaces for warm air, hot water and steam with all of the latest ventilating features and modern im-provements embodied therein, including the company's well-known air blast principle. The furnaces are entirely new in design and construction and complete stocks of all sizes, styles and designs will be kept on hand at the Chicago warehouse so that prompt shipments may be made at all times. The capacity of the foundry at Dayton, Ohio, is said to be over 5000 furnaces per annum, and 275 molders are constantly employed. The company further refer to the fact that the success of the Triumph King furnaces has been something phenomenal consider-ing the time they have been before the trade and that the prospects for the future are very bright. The principals of the company at Dayton are all capable and practical foundrymen with long state that the only hindrance to the

experience, and the location and arrangement of their plant at the point named are admirably adapted for the economical and rapid production of goods. A magnificent and handsomely printed cataloge of the company's produtions is now in the hands of the printers and will be ready for distribution at an early date.

THE JOHN VAN RANGE COMPANY OF Cincinnati, Ohio, lately furnished the complete kitchen apparatus, both for the pessengers' and crew's galleys for the magnificent passenger steamer "North West" of the Northern Steamship Company, which plies between Buffalo and Duluth, making weekly round trips. The kitchen equipment in the passengers' galley is on the same plan as a first-class hotel kitchen, and is one of the finest and most complete kitchen equipments that this company have ever furnished.

CHAS. NOBLE & Co. of Philadelphia, Pa., in addition to the new goods previously mentioned, are this season introducing the Liberty Oak, a new heating stove in six sizes, suitable for hard or soft coal or wood. It is of attractive appearance, with nickeled side rails and top rim, nickeled and tiled panel on upper door, nickeled latch on lower door, and is surmounted by a handsome spun urn. The body is of sheet ateel and the base and fire pot of cast iron. When required, extra linings will be furnished for the fire pot. They are furnished for the fire pot. They are also redressing their Liberty square parlor atove.

THE WORKS of the Portsmouth Stove & Range Company shut down the first week in July for the purpose of giving the employees a chance to rest during the period of the national holiday and to make some needed repairs to make some needed repairs. This short interlude is the first stop in a steady run of six months of what would have been phenomenal business even in brisk times. The works resumed on Monday last with a full complement of men.

THE FACTORY of the Quick Meal Stove Company was partially destroyed by fire early on the morning of the 8th inst., causing a less of between \$20,000 and \$25,000. The fire will not in any and \$25,000. The fire will not in any way affect the shipments of Quick Meal stoves, as the company have ware-houses in Chicago, Des Moines, St. Paul and St. Louis, which are sufficiently well stocked to meet all the requirements of the trade. The work of rebuilding the destroyed portion of the plant will be commenced immediately. Numerous letters and telegrams of sympathy were received by the Quick Meal Stove Company from the trade throughout the country, and as it is impossible for them to answer them all personally, they take this means of stating that the expressions of good will contained in all the communications are greatly appreciated by them.

HAGEY STOVE COMPANY, St. Louis, Mo., are manufacturing and placing on the market Hagey's King heater, a wood stove which is claimed to have remarkable heating capacity. The King is a wood burning stove of neat appear ance, and will keep fire, it is said, for 36 hours. The company, we understand, wish to establish agencies in every city, and say that exclusive sale will be given to such agents. The Hagey Stove Company have row in preparation a descriptive pamphlet of their King hester with handsome litho-

perfection of their plans for consolidation may be the unsettling of business by the labor troubles. As bonds are to be floated, it is possible that a longer time than until Angust 1 will be required to arrange the financial details. Otherwise there is no obstacle which cannot easily be surmounted.

#### Cribben, Sexton & Co.

of Chicago are now eccupying their new etliee and warehouse building. It oecupies 52, 54 and 56 Erie street, adjoining the main building of the stove works, with which it is connected on every floor by fire proof doors. The new building is a fine structure, six stories high, including the basement. Its dimensions are 60 x 125 feet, and it is very substantially built of brick in the style known as mill construction. basement, which is on a level with the floor of the foundry, is fitted with racks for stove repairs, as is also the basement of the acjoining old building. A hand elevator enables repairs to be easily hoisted to the repair elerk's effice on the main theor. The arrangements are of a character to enable business in this line to be handled with dispatch. The first floor, which is on a level with the front street, is used for the double purpose of offices and sample room. The offices extend along one side of the room, being separated from the sample floor by an ornamental oak railing. Near the door is the desk of William H. Cribben, around whom are grouped the clerical force. In the rear of this room are separate private offices for Henry Cribben and Col. James A. Sexton. Colonel Sexton has but recently retired from the responsible but onerous position of postmaster of Chicago, and is now back in the traces as one of the wheel horses of this establishment. The samples shown on this floor comprise coal goods.

The second floor is exclusively used as a sample room. Here are displayed wood turning stoves, oaks, &c. The platforms used on both these floors are of a new pattern. They are mounted on stout legs 12 inches high, and sre built in short sections of varying lengths, printed a parcon color with lengths, painted a maroon color with a silver stripe, and present a novel but striking appearance. Being portable, these platforms permit the sample room to be changed from time to time, so as to make the display of special lines more effective or to break the monotony of a rigid arrangement. Both sample floors are unusually light and have high ceilings. Together they provide 50 per cent. more space for samples than in the old storeroom on Lake street. The upper floors are used for storage purposes, but it is probable that a portion of this space will be taken for a wood pattern shop, tin shop, mounting oak stoves, &c.

The removal of the offices and sample room to the foundry had been contemplated for several years, but it was not until quite recently that definite action was taken. The firm of Cribben, Sexton & Co. were among the first of the stove houses to locate their sales department on Lake street and among the last to leave it. They were on that street for 20 years, and in all that time occupied the same store, being its only occupied the same store, being its only tenants until the past spring. They have already realized the great advantage of having their offices and sample room located in close proximity to the foundry. As business improves they expect to find this advantage increasing. Owing to the central location of the foundry they are still within easy walking distance of the hardware

center on Lake street.

# TRADE REPORT.

## The Iron Market.

The week has been one of exceptional dullness throughout the whole Iron and Metal industry. To this the rioting in Chicago and the general feeling of uneasiness have greatly contributed. Business men have not been inclined to consider purchases or sales while an irresponsible labor organization was trying to bulldoze the transportation interests of an important section of the country. Fortunstely, the latest news

ls reasturing.

In the Iron trade proper labor quesin the fron trate proper 1800r questions are adjusting themselves in a sat isfactory manner. The Sheet mill scale has been signed, and some of the Steel works are getting their scales into good shape. Wages in many instances are low. It may even be said that in some branches and in some localities they are unduly low. But until there is a revival in the demand and until better prices are secured there can be no betterment in this respect. Those mills which have at least regular employment are doing the best attainable for their men. The Coke strike drags along and keeps a good many furnaces idle.
The success of the Chicago furnaces in crowding the Southern producers out of their territory on Foundry Pig Iron offers some explanation of the failure to advance prices on Southern Iron in other sections. Under ordinary conditions the withdrawal of some producers, the stoppage of others and the lowering of stocks all sround ought to have stiff ened prices. But the fact is that the demand is very light all around and that the Southern producers have lost their hold on an important territory. When they are sgain running full they may be forced into active warfare in other leading markets.

Pig Iron.—Buying is on a very restricted scale in the New York market, and yet reports of low prices made by some Northern and some Virginia furnaces continue to come in. A number of founders in this vicinity have had a good deal of trouble about prompt deliveries of Iron on low priced contracts, and have been forced to cover with other parties for prompt delivery at a round advance. The watermelon acason is, as usual, interfering with deliveries of Southern Iron, the steamers taking the perishable freight and leaving the Pig Iron behind. We quote standard brands \$12.50 @ \$13 for No. 1; \$11 @ \$12 for No. 2, at tidewater. Southern Iron, same delivery, \$11.50 @ \$12.25 for No. 1; \$10.50 @ \$11 for No. 2; \$10 @ \$10.25 for No. 3; \$10.25 @ \$10.75 for No. 2 Soft, and \$10.50 @ \$11 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9.75 @

Phliadelphia advices intimate that the market for Pig Iron is very dull, according to sellers' views. Production, however, has been reduced to such an extent that asless must necessarily be in proportion, and tocrefore this dullness is natural. Nevertheless it is significant to find that there is very little Iron for sale. Sales agents say that it is hard to get deliveries, and that consumers do

not want to buy uew lots until the old orders are completed, so that new business is comparatively slow, especially as better prices are required in the majority of cases. Taking everything into account, therefore, it would seem that the market is shaping for improvement, notwithstanding its dullness and the apathy of luyers. Quotations are given about as follows for Philadelphia and equivalent points:

Standard No. 1 Foundry X Standard No. 2 Foundry X	\$12.50 @ 11.50 @	\$13,00 12 00
No. 2 Plain	10.75 @	11,00
No. 1 Soft	11.50 @	11,75
No. 2 Soft	10.75 @	-11 00

In Chicago the local manufacturers have again booked a heavy tonnage in the shape of season contracts. Other business has been tight, as shipments have been almost completely stopped by the strike. The heavy buying is now about over and a period of comparative inactivity may be expected to set in. Quotations on local Coke Iron are reduced, not because costs have been lowered, but on account of the continued competition for business by the leading producers. Southern Coke Iron is very quiet, while prices are higher, owing to advance in freight rates. Lake Superior Charcoal is in very limited demand and prices are not so strong, except on apecial brands, which are well held. Quotations are given as follows for cash:

Lake Superior Charcoal	\$14.50 @	\$15.50
Local Coke Foundry, No. 1	10.75 @	11.00
Local Coke Foundry, No. 2	10.00 @	10.50
Local Coke Foundry, No. 3	9500	10.00
Local Scotch	10.75 @	11.0)
Ohio Strong Softeners No. 1	13.00 @	13.50
Southern Silvery, No. 1	@	
Southern Silvery, No. 2	ā	
Southern Coke, No. 2	@s	10.75
Southern Coke, No. 3	@	10,50
Southern, No. 1, Soft	a	10,75
Southern. No. 2, Soft	@	10,50
Tennessee Charcoal, No. 1	@	
Tennessee Charcoal, No. 2	@	
Alabama Car Wheel	17.50 @	18.00
Jackson County Silvery	15.00 @	16.00

Inquiries are a little better for Foundry Iron In the Pittsburgh district, but sales are still confined to 59 and 100 ton lots. Sales are noted of several such lots of Nos. 1 and 2 Foundry, at prices equal to about \$12, Pittsburgh, for No. 1 and \$11 for No. 2. Q totations are given as follows:

No. 1 Foundry......\$11.75 @ \$12.60, cash No. 2 Foundry.......... 10.75 @ 11.00 "

There has been rather more Southern Coke Iron available in the Cincinnati market during the week, and there were increased deliveries on old contracts, which has given an undertone of easiness to the market, but the demand was mainly for single car lots with an occasional inquiry for as much as 500 tons. The demand for No. 1 and No. 2 Soft continues in excess of the ability of the furnaces to promptly supply. Consumers in that district are melting about as much Iron as usual of late, the Iron Pipe works and the agricultural works being the largest, while the jobbing foundrles are doing comparatively little. Quotations are as follows:

ò
)
ı
)
)

Our correspondent at Birmingham, Ala., reports that market as being in a waiting condition. Orders are refused daily and few orders are accepted beyond six months. Shipments are in carload lots and time orders are for small lots. Stocks of Pig Iron are still decreasing, in fact there are no stocks on hand unsold. No. 1 Foundry is about the only grade on hand. As high as \$10 has been asked for this grade but not accepted. No. 2 Soft commands comparatively better prices, being in great demand. Quotations range as follows: No. 1 Foundry, \$8 @ \$850; No. 2 Foundry, \$750; No. 3 Foundry, \$7; No. 1 Soft, \$750; No. 2 Soft, \$7.25.

## Metal Market.

Pig Tin.—Movement in the market for Pig Tin has been extremely slow. Jobbers and consumers have purchased in a perfunctory manner, evidently looking for the imminent passage of the tariff bill to lower prices before laying in any stock beyond such as they need for immediate requirements. Prices for small lots rule at about 20½ @ 21¢ \$\mathfrak{P}\$ it, although jobbing sales are said to have been made lately at as low as 20¢ for moderate parcels. Importations have been in excess of the broadest estimates of consumption.

Copper.—In the face of slow sales and a tame demand, the price of Ingot Copper has hardened aomewhat, consequent upon the freight embargo and moderate shipments from primary points. Retailers' prices are firmly maintained at former quotations.

Sheet Copper.—The consumptive demand continues entremely moderate and below the average, partaking of the depression which at the present time seems to prevail in all lines of sheet metal products in this section. The price for small lots of Sheet Copper from store is on a basis of 15¢, without discount.

Pig Lead.—The scarcity of ore and fuel serves not only to arouse livelier interest on the part of consumers, but prompts more reserve in the offering by smelters, thus imparting considerably more tone to the market. Prompt shipments from the West are very difficult to make, and spot stocks in hand are quite moderate. This has resulted in slightly higher prices being asked by dealers for small quantities, jobbers quoting them at  $3\frac{2}{3} \oint A 4 \oint P$  lb.

SpeIter.—The demand in this district shows no visible improvement, but offerings are not by any means large, owing to restricted production and the momentary uncertainty as to facilities for obtaining freight from the West. Consequently prices remain steady at former rates Forsmall quantities jobbers' rates are quoted at 41¢ \$\mathrew{F}\$ lb.

Antimony. - Merely routine business has been done, at 10¢ for Hallett's, and 10% for Cookson's, in small lots.

Tin Plates .- Neither spot goods nor future contracts have been purchased except in a very indifferent way, and the buying interest continues tame. Consumers appear to be holding off everything beyond the supply of absolute present needs. Orders reon everything beyond the supply of absolute present needs. Orders received are almost invariably for very limited quantities, but these in the aggregate suffice to keep jobbers fairly busy. The demand for Rooting Plates is fair. A growing demand for the better qualities is noted in New York Otherwise the market is feature-City. Otherwise the market is feature-less. Prices show little change, but the leaning is more in buyers' favor than in the other direction.

A special London cable dispatch of July 11 to The Iron Age reports on the British Tin Plate market as follows: Tin Plate prices have undergone very little change, and except from Canada inquiries are no better. The market is thus rather soft as well as dull. There are now about 273,000 boxes at Swansea stores. Prices there are as follows:

Bessemer Cokes, 14 x 20	@	10/3
Siemens Cokes, 14 x 20	. (1)	10, 6
Ternes, double box	(0)	19
Charcoals	13/ @	15/

Sheet Iron.-No very extensive demand is noted for either Black or Galvanized Sheets. The settlement of the wage scale has resulted in the starting up of a number of mills, and the rest will commence operations within a few weeks at the outside. Consequently the supply will from now on be fully adequate to the demand, and higher prices are unlikely to be had in the immediate future. Those for small lots of Black Iron from stock remain at about former quotations. Galvanized Sheets are hardly as firm as they have been during the past few weeks. Black Sheets for tinning continue in active demand.

## Chicago Report.

Scrap.-Dealers continue to quote the following list of buying prices, Chi-

oago denvery:		
Per i	net ton.	Per lb

## Trade Notes.

THE SUBJECT OF COLLARS would seem at first thought to be more in the seem at first thought to be more in the line of a fashion magazine than a metal trade journal, but in their advertisement this week the Excelsior Steel Furnace Company, 38 West Monroe street, Chicago, show that Collars are strictly in our line. They advertise Square Stack Collars, Top Casing Collars, Boot Collars and Box Collars and cell the street. Collars and Box Collars and call the attention of furnacemen to the fact that these and a vast number of other fur nace fittings are made and carried in stock by that company.

E. T. BARNUM, Detroit, Mich., has been awarded the contract for the Steel Jail Cella for the new prison at Clayton, New Mexico.

THE GRISWOLD MEG. COMPANY, Erie, Pa., issue a circular bearing on the front cover an engraving of a large Kettle, within which is said to be announcements of interest to the person to whom the circular is addressed. The pamphlet calls attention to Waffle Irons, aluminum Kettles, Tea Kettles, Broilers, Cake Pans, &c., while an inset slip refers to a suit on improvements in Waf-fle Irons just decided in their favor.

A fac simile of the official ribbon issued by the authority of the World's Columbian Exposition is being distributed by E. N. Lang & Co., Portland, Maine, relative to stick, drop and wire Solder, which they exhibited at Chi-cago and for which this ribbon was awarded.

A PERMIT has been granted to the Standard Brass Company to build a frame foundry, 50 feet square, on Portland street, Cambridgeport, Mass.

THE BRIDGEPORT WOODENWARE COMPANY, Bridgeport, Ala., are erecting a large addition to their present plant.

THE W. DEWEES WOOD SHEET IRON WORKS, McKeesport, Pa., which have been closed down, will resume work on Monday.

THE SLEEMAN GAS SAVING GOVERNOR MFG. COMPANY Of New York City have been incorporated, with a capital of \$100,000. The directors named are Nathaniel Sleeman and Frederick E. Street of New Haven, Conn., and Ira Selkins, Henry Belden and E. T. Wastell of New York City.

W. P. Loughry, lately representing the Moorhead McCleane Company of Pittsburgh, at 81 John street, York, is now at 96 John street, where he is conducting a general commission business in Iron and Steel of all descriptions. Mr. Loughry's special lines are Galvanized and Black Iron and Steel Sheets, Corrugated Roofing, American Tin and Terne Plates, Sott Stamping Steel and Black Sheets for Tinning. Tinning. He describes the demand for the last named material as being very active.

## CONDITION OF THE

## Hardware Trade.

BUSINESS is practically at a standstill, on account of the strike and the consequent feeling of uncertainty which pervades the public mind. It is, however, hoped that the strike will be of short duration and that law and order will soon again prevail with the resumption of normal conditions. Until this matter is settled the trade are naturally holding back their orders awaiting developments. Notwithstanding the fact that this is the dull season, some manufacturing concerns report a very fair business during the month of June, which has continued in at least moderate volume up to the present time. There is little new in the matter of prices, which remain practically as for the past few months on most lines, the market not being at all strong, but a disposition on the part of manufacturers to refuse to go lower being evident. Collections are fair, but there is some complaint in regard to them.

Advices from Chicago.—The railroad strike has overshadowed everything else. It almost suspended business in Shelf and Heavy Hardware. The movement has been mainly local, as it was impossible for salesmen to travel through the Northwest, and traver through the Northwest, and shipment of goods for a considerable time could only be made by one line of railroad, as all others were unable to run any freight trains. The railroad situation at present is improving, and nearly all the lines are notifying ship-pers that they will again receive freight for points along their roads. It is expected that the curtailment of is expected that the curtainness of the past ten days will cause an active movement for some little time after the railroads are opened. Apprehension exists, howopened. Apprehension exists, now-ever, regarding the proposed sympa-thetic strike on the part of the general labor unions. Should this occur the situation may radically change and traffic be again completely paralyzed. Reports from the agricultural sections are of an encouraging character, crops being much heavier than had been expected until very recently, and there is every reason to hope for good business after the labor troubles are settled.

#### Notes on Prices.

Wire Nails.—The improvement in the tone of the market in the matter of prices, which was noted in our last issue, still continues and a further advance has been made. The manufacturers are now quite firmly quoting \$1.15 on carload lots at mill. The demand, however, is limited, comparatively few orders being placed. Many of the mills have stopped or are materially diminishing their production. Stocks on hand with the manufacturers are referred to as light. Quotations for small lots from store in New York are \$1.30 to \$1.35.

Advices from Chicago. - Business is at a complete standstill and manufacturers appear to be making no effort whatever to take orders, as their works are shut down and shipments have for some time been out of the question. Quotations on factory lots are, therefore, unchanged at \$1.20 to \$1.25, Chicago. Small lots from stock are still held at \$1 25.

Cut Nails.—In sympathy with the improved condition in Wire Nails a slight advance has been made in the price of Cut Nails, which are now regularly quoted at \$1 to \$1.05 for carload lots on dock in New York. The demand is only moderate. Stocks in the hands of manufacturers are not large, and with the present diminished output are not likely to be materially increased during the next few weeks. Small lots from store in New York are quoted at \$1.10 to \$1.15.

Advices from Chicago.—Almost nothing is doing by manufacturers, as they have been unable to operate their mills on account of their inability to get fuel or to make shipments to customers. Prices on factory lots are unchanged at 95 cents, Chicago, on 55-cent average. Jobbers quote small lots at \$1.15.

Barb Wire.—There is little to note in the Barb Wire market, the demand, as usual at this season, being light. Prices are without change and somewhat uneven, and represented by the following quotations for Four-Point Galvanized, delivered at the points named: Pittsburgh. \$2.05 to \$2.10; Cleveland, \$2.10 to \$2.15; Cincinnation Allentown, \$2.25 to \$2.30; Chicago or New York, \$2.25 to \$2.30.

Advices from Chicago.—Manufacturers' agents have been doing little or nothing for some time past. Factories are shut down and shipments are completely checked. No one is disposed to talk of new business. Jobbers continue to quote Galvanized in small lots from stock at \$2.35 to \$2.40, with 10 cents off for carleads.

Aluminum Juice Extractors.—In our last tssue we illustrated some new Juice Extractors which Silver & Co., 304 to 310 Hewes atreet, Brocklyn, N. Y., have recently put on the market. These goods are sold to the trade at the following net prices:

Cordage.—There has been no further advance in the price of Cordage since our last review of the market. The successive advances enable the jobbers to meet or, if desirable, undersell manufacturers' prices, and consequently the greater part of the trade is in their hands.

Glass. — Present conditions are not favorable to activity in trade, the past week having witnessed a large falling off in business, especially in the West. Manufacturers are not making concessions in prices to secure orders, not withstanding the season of the year nor the possibility of an increased importation of foreign Glass. The impression prevails that when assortments of American Window Glass are so far depleted that the foreign article will be required to make up the deficiency, advantage will be taken of the situation and the price of imported Glass will be advanced on the other side. Manufacturers' quotations on Pittsburgh Glass are reported as being 80 and 10 and 5 per cent. discount.

Old Metals.—Although the market for Old Metals generally is quiet, there has been sufficient business passing to keep prices steady. Those for Metals, other than Scrap Iron show a slight advance. The following quotations represent about the rates paid by dealers in this city for small lots:

Heavy Copper	Ib 7 🦸
Light and Tinned Copper	1 616¢
Heavy Brass	1b 5 ¢
Light Brass	1b 4 ¢
Lead	1b 3 ¢
Tea Lead	1b 28; €

Jute Rope # 15 1½ @ 1%	ŧ
Mixed Rope	
013 0-13.44 4 4.5-1	

Old Rubber.—A fairly active demand exists for some lines of Old Rubber. Dealers' purchasing prices, New York delivery, are as follows:

THE NEW JERSEY METAL REFINING WORKS of Elizabeth, N. J., announce that they have appointed Saunders, Fielding & Bond, 108 Fulton street, New York, as their commercial agents.

An unusually attractive advertisement is the eight-page announcement elsewhere in this issue of the Favorite Stove & Range Company, Piqua, Ohio. Four pages are printed in black and four in red, the colored ink making a handsome contrast. The goods shown are all sessonable and will appeal to the trade at large. There are six heating Stoves illustrated and two cook Stoves, while all necessary particulars are given of the constructions in the advertisement.

The announcement, made some weeks ago, that the Spanish Government, in order to increase the revenues of the island of Cuba, proposed imposing a tarlff of 25 per cent. ad valorem on all foreign goods imported into that country, caused the sending over of a number of substantial orders for galvanized iron for prompt shipment, in order to escape the expected duty. In the then condition of stocks, however, the mills were utterly unable to meet them, and the orders were generally returned. As, by later advices, it appears nearly certain that the reciprocity arrangement between Cuba and this country will be undisturbed, these large orders are unlikely to be renewed. Exporters have, however, been making some fair sized shipments of galvanized roofing sheets to Cuba within the past week or two, and the outlook for a good export business in this material is said to be favorable.

The "Daring," one of the new British torpedo boat destroyers built by Thorneycroft, in her recent speed trial

on the Thames eclipsed the high speed record held previously by the "Hornet," another of this new type of vessels. The "Daring" attained against the tide s speed of 29.268 knots, while the Yarrow built "Hornet" accomplished but little over 28 knots. The "Daring's" record is the highest made by any vessel.

THE BOOUS PLUMBER is abroad in Philadelphia, mssquerading for nefarious ends under the guise of a plumbing inspector. The police of that city have sent out notices warning heuseholders against him.

### Reinforcing Dry Wells.

We commend to the attention of our readers the contributed article that is presented elsewhere in this issue on the reinforcement of deficient water supply in wells. In the country distriets, at this time of the year, many people who depend upon wells for their water supply suffer from drought and are compelled to either borrow from their neighbors or do without waterthe last being a very disagreeable necessity in warm weather. The artiele recounting methods of increasing the water supply of wells is interesting and has been prepared by one thoroughly competent to advise on this subject. We believe many of our readers who are called upon to do work of this kind will read with interest the suggestions therein contained, and we hope they may prove nseful to them during the present season.

Proposed Legislation Relating to Care of Steam Boilers.

There is always some danger that special legistion directed toward the suppression of existing evils may fail of its object by the introduction of ill considered and impracticable features. Particularly does this liability exist when those not skilled in framing laws attempt this difficult work. Legislation is, so to speak, one of the arts of statesmanship; and when those who are not trained in the art, however skilled they may be in other walks of seience or business, attempt to frame laws, they are quite as apt to make a mess of it as a very good lawyer might be if he attempted to make shoes, or as a skillful surgeon might be should he undertake the execution of plumbers' work. Proposed measures have been brought to the notice of the steam and hot water heating trades having for their purpose the legal regulation of the care and attendance required in | practical knowledge of the real neces-

the operation of steam boilers. The proposal seems to have been favorably regarded in some quarters, and, either in its present form or with some medifications, is likely to be brought forward again before long. It is held by the promoters of this measure that no employer ought to exact from employees caring for and operating sta-tionary engines and boilers any kind of work except such as is involved in such operation and care; and it is proposed to legally prohibit such exactions with penalties both for employers who demand and employees who submit to them. The intent is, obviously, to reach and suppress a practice which. while sometimes leading to dangerous neglect on the part of engineers in charge of steam plants, does not relieve them of responsibility for such neglect when damage to life and property re-

#### A Reprehensible Practice.

Engineers in charge of engines and boilers used for power purposes only, for heating purposes only or for both these purposes simultaneously—the latter use being constantly on the increase, as in the rapidly multiplying large office buildings of our cities-are frequently ealled upon to leave their legitimate and special work to perform repairs of machinery, to do plumbing work and even painting and earpenters' work. Derangements of the steam plant may occur during their absence, which if not at once attended to may either induce dangerous conditions or be attended with immediate destruction.
If the latter result the engineer in charge is usually blamed and not unfrequently punished, while the underlying fact is that, in most cases, his neglect is not willful, but enforced by the demands of his employer. This practice admittedly calls for some restrictive measures, and perhaps legislative enactment could be made to cover the necessary ground without introducing undesirable features. It will, however, be found no easy task to provide suitable and adequate legal remedies.

## A Possible Danger.

The history of special legislation of this kind shows that it is liable to be made at first altogether too broad and comprehensive. Subsequent reconsideration and amendment are found necessary to remove burdensome evils imposed by conditions not at first recognized and in ways not at first foreseen. As a ease pertinent to the proposition under discussion, let us cite a small shop wherein a portable engine of, say, 2 horse-power supplies all the power needed for such work as is not performed by hand. Such an engine usually stands on the shop floor, and a machinist running a lathe or some other tool near it is charged with supplying the engine with fuel and water, keeping it oiled and maintaining it in good running order. No one having a

sities of the case would insist that such an engine requires the full time of a skilled engineer. The terms of any enactment directed to the regulations of care and attendance required by steam boilers should, therefore, discriminate between such a plant and one which comprises one or more large engines for power purposes, or one which, perhaps, comprises a set of passenger elevators, dynamos for electric lighting and heating apparatus of capacity for warming the largest buildings. Thousands of factories exist where large or small steam boilers, working under low pressure, are used to begin begins liquide in table or vate. for heating liquids in tanks or vats. Discrimination would be necessary between extensive dye works, employing boilers of perhaps 100 horse-power and, say, a cheese factory only needing and, say a three and the say in the auto-natic damper and water feeder, for warming milk and supplying hot water for cleansing vats and utensils. pressure boilers for domestic heating, with gravity returns, could not be properly included in the same eategory as high pressure boilers. Many other distinctions relating to uses, pressures, situations and limitations must be regarded in order that any law, while reaching the real evil it is sought to remedy, shall not be so handicapped with impracticable and unwise provisions as to neutralize its usefulness.

## No More Cyclones Feared. \

A despondent correspondent writes us: "Well, the great railroad strike is over, and the country has again suffered heavy losses to swell the aggregate of the national profit and loss account for this year of grace. From which direction are we to expect another cyclone? It is too much to hope that our troubles are over." We beg to enter a disclaimer against this line of reasoning. All sorts of unexpected things have happened to upset business, and possibly Jove may have another thunderbolt ready forged to hurl against us, but we don't believe it. For some time the only calamity to be really feared was a national upheaval of labor. The leaders have been determined to try conclusions by the adoption of forcible measures to overcome the influences which have latterly borne so hard on those who work for wages. The effort has been made, and The leaders have been dethe most formidable undertaking of modern industrial history has com-pletely failed. The conservative policy now manifested by those leaders who have not lost their prestige by futile strikes appears to be a guarantee that we are to have no further disturbance of this kind in the immediate future. The labor crisis burst upon us suddenly, and has passed. Local issues may still have to be fought out and may still have to be folget out and settled, but they are comparatively unimportant, and such conflicts will gradually terminate. The settlement of the tariff question is also very near at hand, and the business interests of at nand, and the business interests of the country will then proceed to the great work of building up and restor-ing the sadly shattered structure of national prosperity.

# THE LETTER BOX.

## Comparative Cost of Fuels.

From S. D., London, Ontario. - Will The Metal Worker or some of its readers favor me with figures showing the comparative cost of gas, oil and coal as fuel for heating purposes, the gas to be taken at a cost of \$1 per 1000 cubic feet; the coal oil to be converted into gas at 10 cents per imperial gallon, which is one fifth more than United States measure, and coal at \$5.25 a ton? I have an idea that gas at \$1 per 1000 cubic feet will cost less than coal at \$5.25 per ton, to be used in base burners and furnaces. It is well known that gas at \$1 per 1000 cubic feet is the cheapest kind of fuel for cooking, but for heating it is a new departure in this part of the country, and I should be lad to receive suggestions and data on the subject.

Note -We hope our readers who have had experience in this line will give this correspondent some information. In the natural gas districts of the United States the opinion seems to prevail that gas at 35 or 40 cents per 1000 cubic feet would compare favorably with coal at the price mentioned by our correspondent. The use of oil for fuel in hot air furnaces and stoves has not been so general in the past as to furnish much reliable information regarding its cost, but the assertion is made by the manufacturer of a burner adapted for using such fuel that oil would cost something less than coal.

## Capacity of Gas Pipes.

From R. L. S., Fredericksburg, Va. I would like to ask what would be the difference in the amount of gas furnished if a 3-inch main is tapped with 11/2. inch pipe and run to the meter full size (11 inch) and the same main be tapped with a 1-inch pipe and run to the meter by means of a 1-inch nipple, connected with 1½ inch pipe. What I want to get at is this: Is there any advantage, after tapping a main with 1-inch nipple, in using 11 inch pipe the rest of the way?

Note. - In a general way the capacity of the pipe is determined by the area of its smallest section, in the same sense that the atrength of a chain is equal to the strength of the weakest link. The analogy, however, is not quite correct, because of the element of friction. The friction of the fluid, whether water or gas, will be increased in the smaller pips, and, therefore, in the case our correspondent cites, the 11-inch pipe connected to the 1-inch nipple will give a greater volume of gas than a 1-inch pipe connected to a 1-inch nlpple. While we say that there will be a difference in favor of the larger pipe, we do not think it would be any appreciable quantity, provided the length of run is only for a comparatively abort distance.

Friction is not only dependent upon the size of the pipe, but it is also affected by the distance the gas is carried. In the case of water carried in a pipe the element of friction is very considerable, but it may be left out of account in this gas problem. Considered in a practical light, therefore, we think our correspondent would do well to use the smaller pipe, or, in other words, make the pipe conform to the size of the nipple, as the advantage he would get with the larger pipe would not, under ordinary circumstances, be very great.

### Wants a Cheap Japan.

From BATES & LUTZ, Wilkes-Barre, Pa.—Please inform me through The Metal Worker how to make a cheap japan for use on tin.

Note. - We are inclined to think that our correspondent can obtain from man ufacturers or dealers a japan that will answer his purpose better and at less coat than he could make it. One of the workshop receipt books gives the following as a black japan for tin lanterns: Asphalt, 11 ounces; boiled linseed oil, 4 pints; burnt umber, 4 ounces. Heat until well mixed, and when cool add turpentine until of the proper conalstency, applying with a soft brush.

### Utilizing Condensation.

From OLD SUBSCRIBER, Toronto. We want a simple system of saving the water of condensation from the heating aystem of a factory carrying 10 pounds pressure and from the dry kilns and kettles carrying a higher pressure. want to discharge it into a tank so that it can be pumped out for other purpose. How can it be done?

Note. - Many of our readers doubtless can supply the information needed, and we hope to hear from them as to the methods they would advise to be used. Any one of several different makes of steam traps could be connected with the piping which carries the condensation, a trap being required on each line of pipe carrying a different pressure. The operation of these traps is such that after collecting a quantity of water they trip and discharge into the outlet leading to the tank.

## Connecting the Vent Pipe.

From H. H. L., Willimantic Conn. Please inform me through The Metal Worker which is the better way to ventilate a water closet. Should the vent pipe be connected with the lead bend or to the vent horn on the pottery? If connected with the vent horn there is liability of it cracking off should there be a severe jar on the floor, or from the | its ateerage passage rates to \$10.

strain caused by the weight of the pipe if the pipe should settle.

Note. - We shall be glad to have our practical readers give their opinion on this aubject. It is generally considered that as little space as possible in the water closet should be left unvented. Therefore when the closet is constructed with a vent horn the ventilating pipe should be attached to it, and by the use of the rubber connections adapted for this purpose the danger of breakage is very small. Many closets are made without vent horns, in which case there is no choice but to ventilate from the lead bend as suggested.

"Vulcan" in the London Ironmonger warns English metal casters and dealers in scrap metal, when purchasing from Continental dealers, to exercise considcrable care or they will run a chance of having their premises wrecked by the explosion of infernal machines. At the warehouse of George Parsons, Birmingham, metal refiner, &c., he says, a brasa bomb has been discovered, making the fifth which has come to light in the same city in three months, and, like the othera, its place of origin is the Con-tinent. This was found owing to the care which has been exercised since one of the furnacea was wrecked by a bomb which a workman had accidently thrown into it. That no one was killed or maimed is marvelous. As it was, a portion of the bomb passed through a man's coat, through an open door and ultimately found its billet at the other side of the thoroughfare.

An open letter has been addressed by Jacob Meurer of Meurer Bros. Company, Brooklyn, to Mayor Schieren of that city, protesting against the proposed action of the Bureau of Taxation to levy a personal and aupplemental tax upon manufacturing corporations whose plants are located within the city's limits. Mr. Meurer points out that this plan would embrace only 442 out of the 11,000 manufactories of Brooklyn, the number that are incorporated, and this discrimination he claims to be unjust and detrimental to the best interests of the city, as liable to drive the larger manufacturers out of its bounds.

The potteries of Wheeling, W. Va., resumed in full on Tuesday, after a seven months' shut down. The men agreed to return to work on the same basis as the Trenton potters-namely, a reduction in wages of 121 per cent. More than 1500 employees are affected. Only the East Liverpool, Ohio, potters are now holding out.

The latest move in the ateerage rate war between the transatlantic lines has been made by the directors of the White Star Line, who have cut their steerage rate from \$25 to \$10. The American Line has also followed suit in reducing

closes the oven. The dimensions of the portable ovens are 46 inches high, 36 The Excelsior Steel Furnace Com- inches wide, 36 inches deep and the pany, Chicago, put on the market a legs are 9½ inches high. The fire box is

Double Hot Air Branch.

84 inches square.

number of new sizes and lengths of double and single het air stacks and branches, and have thus increased their already extensive assortment of furnace fittings. They are now carrying over 300 different sizes and lengths of stacks and stack branches in stock, and they are in a position to supply every reasonable want of the trade. We show in the accompanying illustration a double branch consisting of one and a half joints 29 inches long. They are also made of one joint, two joints, two and a half joints, three, three and a half and four joints. The double stack is also made in a variety of lengths, giving altogether a variation in size from 193 inches to 13 feet 6 inches, which can be placed in partitions without patching or soldering.

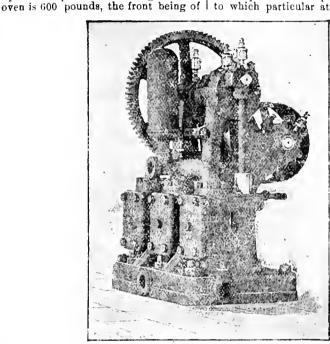

#### Millet's Patent Portable Core Oven.

The Millet Portable Oven Company, Brightwood, Msss., are offering the trade s portable core oven such as is shown in the illustration presented herewith. This firm brought out about six years ago a similar core oven, brick aet, which has been used iu many foun-dries. The present oven has been brought out to meet the needs of smaller foundries who want a portable oven. A special feature of the Millet | back of galvanized iron. As shown in

The weight of the

Triplex Power Pump.

At a recent convention of the Steam and Hot Water Fitters' Association of the United States, held at the Broadway Central Hotel, New York City, an interesting exhibit was made by the Dean Steam Pump Company, Holyoke, Mass., with New York office at 72 Cortlandt street. One pump that attracted particular attention was the Triplex power pump, shown in the accompanying illustration. This machine was recently put on the market and is designed especially for situations where steam is not available or where its use may be objectionable, and it is particularly adapted for operation by electricity. It is compact in form and every part of the machine is easily accessible for inspection or repairs. A feature to which particular attention is called

Triplex Power Pump.

There are four doors 5 inches high and

is that it lends itself to a large and varied field of usefulness, such as boiler feeding, elevator work, either of the closed or open tank system, and can be easily arranged to run with any form of electric motor. The regular form of design is intended for belt power and is supplied with tight and loose pulleys. All the bearings of the pump are lined with phosphor bronze and supplied with glass oilers For supplying water to tanks and general distribution in hotels, large office buildings and apartment houses, it is claimed to have many advantages, notably its remarkable smoothness of motion, giving a steady flow, free from jar and shock and running practically noiseless.

Norwich, Conn., is to have a new manual training building attached to the free scademy of that town.

The world's wheat production in 1893 was estimated at 2,449,000,000 bushels. The Swiss Society of Commerce gives the following table of consumption of wheat per capita in the various countries named: England, 252 various countries named: England, 252 pounds; Italy, 310 pounds; Holland, 283 pounds; Austria, 187 pounds; Portugal, 136 pounds; Denmark, 165 pounds; Germany, 143 pounds; Norway, 66 pounds; Sweden, 66 pounds; Russia, 99 pounds; United Statea, 357 pounds; France, 705 pounds; Switzerland 405 pounds; Spain, 418 pounds. land, 405 pounds; Spain, 418 pounds; Belgium, 378 pounds; Hungary, 351 pounds.

## PLUMBING and GAS FITTING.

The Reinforcement of Deficient Water Supply in Wells.

BY G. D. HISCOX.

The water supply of the ordinary well is but little appreciated by communities enjoying the luxury of a water supply from a water works distribution; but to a vast population not only of the United States, but of all the world, the common well is the only source of dependence for good and wholesome water. Its failure from overdraft or a dry

It therefore becomes a matter of importance to those having little or no resource beyond the supply of their wells, to have at hand such information as may be applicable to the various conditions of water supply as will enable them to know what can be done to increase the tlow of water in their wells in the most economical manner.

The depth of the subterranean waterways varies to a considerable extent with the seasons, rising and falling with the seasonal variation in the rainfall. Wells that have been sunk in a wet season are very liable to become deficient or lose

the driving tube, Fig. 2, and the boring auger, Fig. 3. The driving tube may be made of galvanized sheet iron No. 16 or 18 wire gauge, 1½ to 2½ inch thick, with a band made of the same metal about 2 inches while riveted upon the outside at both ends. The length required should be found by sounding the bottom of the well with a pointed ½-inch iron rod to see if it is clear of boulders or rock for the desired distance. Four to 6 feet in length, and from 8 to 12 inches in diameter, will be found generally sufficient for this kind of tube.

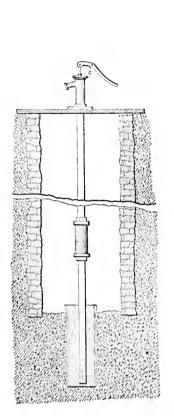

Fig. 1.-A Reinforced Well.

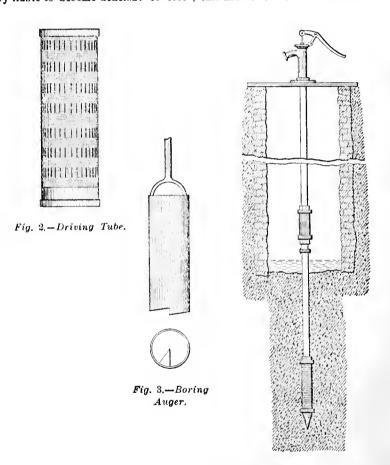

Fig. 4.—Drive Well Point Connected to Pump Suction.

THE REINFORCEMENT OF DEFICIENT WATER SUPPLY IN WELLS.

season is a source of apprehension and deprivation that invites any means of repairing the fault or reinforcing its output as worthy of serious consideration.

It has become a common complaint that by the forest clearing of the country and the incressed draft on the subterranean waterways by the increase in population, the old wells are losing their normal level and often run entirely dry during a drought.

their normal fever and order that the tirely dry during a drought.

At such times of drought or minimum rain supply, not only farm wells, but villages and towns not blessed with water works and ample summer storage, have not only to nurse their scanty supply, but often have to bring water from a distance

their water entirely during a dry season, while those sunk in a dry season seldom fail.

After a well curb has been put into place and the earth settled solidly around, it is a matter of no little difficulty to deepen the well by the old method of digging out and sinking an inside curb.

In wells having a substratum of gravel, sand or even quicksand, the most treacherous of water holding material, much can be done toward obtaining a greater depth by materials and appliances that can be furnished by any tin or sheet iron worker, or by a neighboring blacksmith. For this purpose we illustrate a reinforced well, Fig. 1;

Cutting the slots may be done by sliding the tube upon a bar of large round iron, or a sheet iron worker's horn, and with a sharp, thin cold chiscl cut through the tube in rows so arranged as not to wesken it, as shown in Fig. 2, making the slots no wider than will allow a slip of tin to enter. If a slot should be inadvertently cut too wide, it should be pressed or hammered back at the end of the horn. If convenient it may be covered with a fine brass wire gauze.

The next appliance is the auger, to bore out the sand from the inside of the pipe. This may be made of the same iron as the pipe, and from 1 to 2 inches smaller, 18 to 20 inches in length,

the boring end to have a spiral lip, as shown in Fig. 3, which may be strongly soldered into place; the forked handle to be riveted to the auger tube, as shown, and of a length suitable for building. The operation of sinking and boring out the strainer tube can be most conveniently done by the use of

holes in rows about 11 inches apart for a distance of 3 or 4 feet from the bottom, after which it may be galvanized and covered with two layers of brass wire cloth or ganze, No. 40 upon the inside or next the pipe, and No. 50 upon the outside. The gauze to be soldered at the laps and also to the pipe

the pump pipe just above the water level. As many as four 2 inch pipes have been thus connected in a well 6 feet in diameter with most satisfactory

Where there is uncertainty as to the character of the lower stratum, which may be clay, or have boulders that require to be displaced, it is better to make the reinforce of a more substantial material, say of the ordinary galvanized iron pipe with screw joints; using a little more precaution in fastening the wire gauze strongly to the perforated pipe. For large strainer pipes, say of 6 to 10 inches in diameter, machine screws may be used to fasten the gauze to the pipe, and a spot of gauze around each screw head soldered to it; also a row of screws around the bottom to keep the gauze from slipping, as shown in Fig. 5.

For large reinforcements to be made without boring out the sand, or where severe driving may be necessary, as through a clay stratum, a point or chisel may be made for the strainer, Fig. 5, by drawing or tlattening a short piece of pipe and screwing into the lower coupling. The upper end of the completed pipe should have a screw cap for receiving the blows of a hardwood ram, which may be a stick of oak timber, handled by hand or slung in a rope over

a pulley.

Where there is opportunity of using a lever or screw jack to press the pipe down, it makes the work much easier. The fulcrum may be a piece of timber placed across the well and loaded with atone.

This system of reinforcing wells has been long in use by the writer, and a variety of plans of application may be suggested by the situation of the well and the means at hand, a pole being often the means of transmitting the power for driving the pipes from the top to the bottom of a well.

There are many wells in the vicinity

of New York that have been reinforced in the manner above described, with the result of a large addition to their old supply, and here and there a dry well has been restored to usefulness.

In wells that bottom on rock, a reinforce may be made by drilling a 3 or 4 inch hole in the rock to the desired depth, and placing the pump suction and strainer within and reaching to the bottom of the drilled hole, as shown in Fig. 6. In this way not only the whole available depth of the original well may be utilized, but often a large increase of flow may be had from the fissures in the lower rock stratum.

We present herewith an illustration of a gasoline torch made by the Union Heater Supply Company of Detroit,

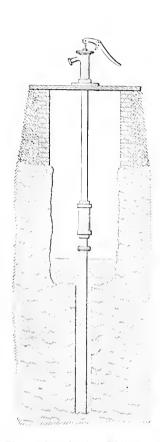

Fig. 5.-Fastening Gauze and Point to Large Strainer Pipe.

Fig. 5.-Reinforcing Well in Rock.

THE REINFORCEMENT OF DEFICIENT WATER SUPPLY IN WELLS.

two ladders, standing upon the bottom of the well, with a board across the rungs near the water, which will enable a person to operate the auger with facility and safety. The strainer tube is to be placed in position near the center of the well, and gently crowded down into the sand by the weight of the person, and rocking a little to settle it as far as possible before operating with the sand auger. Then, with the auger in hand, bore a charge from the inside of the strainer and pass the auger out of the well to be emptied.

As you bore below the bottom of the tube, continue to push it down, and at last strike the tube lightly with a wooden ram or block, keeping the atrainer tube in a vertical position. In this manner the strainer tube may be aunk until its top is nearly even with the bottom of the well and the sand bored out flush with the bottom of the strainer.

The pump pipe or suction may terminate near the bottom, as shown in the cut, Fig. 1, which will enable the full depth of the well and the reinforce to be utilized.

Where it is found desirable to sink a atrainer for a deeper and larger supply, a stronger pipe is recommended, such as a boiler tube drilled with a inch

in apots between the rows of holes, and well soldered at the top and bottom to keep it in place while in the process of ainking.

In this way a reinforce of from 10 to 20 feet in depth may be made in quicksand, which is a bar to the sinking of wells in the ordinary way. In large wells these pipes may be duplicated to the full extent of their water resources. Where drive well points can be readily procured they can be often used to

The Diamond Gasoline Torch.

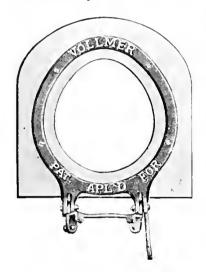

advantage, but if they are small will not allow the pump auction to be placed inside, and therefore may be connected directly with the pump, as shown in Fig. 4. If there is more water required than one pipe will furnish it may be duplicated by driving a pipe on each side of the well and connecting both to

Mich., that is meeting with a hearty reception at the hands of the trade, because of its excellent working qualities and convenience in handling. The deand convenience in handling. vice is light and small enough to be carried in the kit or pocket, and yet, it is said, possesses all the advantages of a larger tool for similar work. The tank is

made of brass and holds about 4 pint of gasoline, the top of the tank being made in such a way as to form a generating The burner is so constructed that the flame can be regulated to suit the work. The handle can be adjusted at any angle convenient to the operator, or it may be detached for close packing. The flame is very strong and not easily extinguished. In melting the joints to remove cocks or fittings from old pipe, the flame can be so manipulated as to cover every part of the work. In the hands of an expert, solder can be put on a pipe and a joint wiped in positions where it would be awkward to pour on the lead with a ladle as ordinarily done. It is furthermore very convenient for use in keeping the solder hot when wiping seams in lining tanks with lead.

## Hopper Closet Specialties.

The illustrations presented herewith show some hopper closet specialties put on the market by the Zero Valve Com-

Some Hopper Specialties .- Fig. 1.-Vollmer Closet Seat.

pany of 212 Seneca street, Buffalo, N. Y. Fig. 1 shows the Vollmer awing closet seat, adapted for use with ordi-nary Philadelphia hopper closets by the simple adjustment of two screws at the back. A malleable iron ring is fastened to the seat, reducing to a minimum liability of breakage, the iron ring serving also to prevent the wood work from warping or aplitting. This device is

being made for lifting the seat the closet is convenient and clean for use as a urinal.

Fig. 2 is a sectional view of the Zero anti-freezing closet valve, No. 1 on the cut being the supply pipe and No. 3 the flow pipe to the fixture, while No. 2 is

very durable, only one Fuller ball washer being used. The device is operated by a lever provided with a weight, which can be adjusted to suit the pressure against which it shuts. No. 1 is the supply and No. 2 the flow to the fixture. When the lever is raised

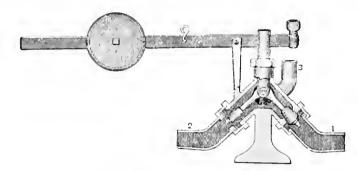

Fig. 3.- Vollmer Anti-Freezing Closet Valve.

the waste, permittingfall the water in the fixture above the valve to waste into the soil pipe to which the waste pipe runs and is connected. On raising the lever to open the valve, the piston closes the opening to the waste pipe and dropping the lever shuts off the supply and opens Complaint has sometimes the waste. been made of water hammer when the the valve shuts off the waste, leaving an unrestricted flow to flush the fixture. The weight dropping down closes against the pressure, overcoming the possibility of water hammer. When the waste is opened the water in the fixture above the valve flows through No. 3, leaving sufficient water in the valve to form a secure seal, preventing the pos-

Onondaga Bathlub.

valve closed with the pressure. This trouble, it is claimed, is entirely overcome in this device by connecting the aupply to the waste, No 2, and the waste in turn to No. 1, which is generally used for the supply. The lever is so constructed that it may be operated by either a chain or a connecting rod, a socket in one end of the lever and a

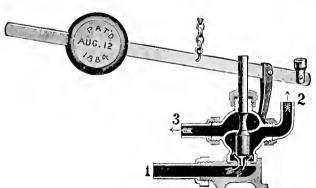

Fig. 2.—Zero Anti-Freezing Closet Valve.

claimed by the manufacturers to save time and cost as compared with the wood seat ordinarily furnished by a wood seat ordinarily furnished by a carpenter, and being composed of cherry, highly polished, is more ornamental and durable. By its use the necessity of inclosing the hopper closet in wood work is avoided, and provision link at the center being provided for the purpose.

Fig. 3 shows a sectional view of the Vollmer anti-freezing closet valve, more than 1500 of which, the makera state, have been sold in Buffalo during the past six months for use in connection with hopper closets. The valve is

sibility of sewer gas escaping through the fixture. Both of these devices are adapted for use with outside closets and can also be used with stop and waste cock if desired.

## Onondaga Bathtub.

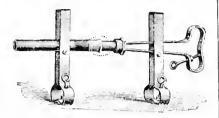

We show in the accompanying illustration a general view of the Onondaga bathtub made by the Pierce, Butler & Pierce Mfg. Company of Syracuse, N. Y. This is a 5-foot steel clad bath, decorated in light gray and gold and lined with 12-ounce planished copper. It is furnished complete with Fuller double bath cock, stand waste and overflow and supplies, all nickel plated. The rim is either natural oak or cherry. The bath, as mentioned, is 5 feet long and has a depth of  $17\frac{1}{2}$  inches and a width of 28 inches including the outside rim. The hight from the floor to side rim. the top of the rim is 231 inches. tub can also be furnished in lengths of 41 and 51 fect.

The Metal Worker acknowledges the receipt of a complimentary ticket to the first annual excursion of the Master Plumbers' Association of Newark, N. J., to Pleasure Bay, through the court-eay of Treasurer Jacobi. President Burda and Secretary Don of Newark will receive excellent assistance from President Hickman and the Paterson plumbers in making July 27 a day long

to be remembered. A clambake and refreshments are mentioned as enter-tainment.

## G. & V. Pipe Clamp.

The illustrations presented herewith ahow a plumbers' pipe clamp recently put on the market by Gardenier & Vermeulen, Paterson, N. J. The clamp consists of a piece of spring steel  $\frac{\pi}{4}$  inch wide and  $\frac{\pi}{4}$  inch thick, bent as

G. & V. Pipe Clamp.—Fig. 1.—Clamps Supporting Pipe for Soldering.

shown in Fig. 1, and provided with a set screw for accurely holding the pipe. In the base of the device a steel wood acrew having an eye in one end is provided for fastening to the floor or wall, being easily secured by the use of a hammer and bending pin. In Fig. 1 three clamps, which comprise a set, are shown. Two of the clamps are fastened to the floor, one to support a pipe which has been prepared for wiping a joint, while the second clamp secures a third, which is employed for supporting a union into which it has been inserted.

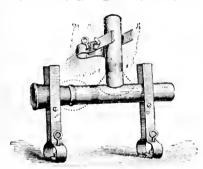

Fig. 2.—Showing Another Application of Clamps.

Fig. 2 shows two clamps fastened to the floor and supporting a soldering nipple and a piece of pipe, while still another is secured to the wall and holds an upright branch. It is claimed that this device is very light and durable, not adding much to the weight of the tool bag, while saving the time and labor of securing bricks for holding the pipe when wiping a joint. It is also claimed that the clamps hold the parts of pipe securely together, there being no danger of their parting while being worked.

#### TRAPS AND VENTS.

Louis W. GAY, "Red and White Pepper" of the "Knights of Tabasco," and dealer in plumbers' supplies at Buffalo, N. Y., informs us that "Peppers" Foster, Palmer and Duncan, accompanied by a mild plant named Smith of Buffalo, sailed for Europe last Saturday on the steamer "Farnesia."

THE PLUMBING GOODS FACTORY Of the Pfau Mfg. Company, Cincinnati, Ohio, was slightly injured by fire last week.

A NEW PLUMBING ESTABLISHMENT has been opened at 64 Foote street, New Haven, Conn., by Kelly & Coady. Mr. Kelly is from Newark and Mr. Coady was formerly with T. W. Corbett.

THE PUBLIC BUILDING COMMITTEE of the City Council of Wilwaukee, Wis., decided to recommend for passage the ordinance providing that only expert plumbers should be employed as city plumbing inspectors.

Moroan Jones, who was for a long time a plumber on Centre street, New York, died recently at his residence, 132 East Sixty-fourth street, at the age of 64 years. He was a Welshman and took a prominent part in politics, having served in the State Legislature and in Congress. He is survived by a family of adult children.

E. BROWNHILL has opened an office and showroom at 838 Broadway, New York, for the goods of the two companies whom he represents. For the Instantaneous Water Heating Company, Chicago, he is showing the Douglas and Acme instantaneous water heater set up in connection with two marble lavatories and a handsome enameled bathtub, so that the quantity of water and the time of heating can be readily shown to those who are interested. They are connected to use gas, and the gasoline heaters are also exhibited. Some of the goods are shown in planished copper, others full nickel plated and one in sectional construction to show the operation. Above this attractive display is one of the company's signs, which has a black velvet background on which are arranged nickel plated letters around a bas relief water heater connected with a bath. For the Brownhill Company, Chicago, he shows, attractively arranged, various sizes of the Perfect gas controller for automatically controlling the pressure and securing a more economical consumption of gas, whether used for lighting or cooking and heating. To demonstrate the difference in ing. To demonstrate the difference in the light and the consumption of gas under different pressures and with the Perfect controller he has an attractively painted gas holder with which by weighing when filled he can get a pressure of 20 inches, when an ordinary gas burner shows an almost entirely blue flame, which blows so that the waste of gas is readily understood, while lights that are protected by the Perfect controller are not influenced but burn steadily with a good, strong light. The vary-ing pressures in city gas mains are well known to many and the effect on gas stoves particularly for cooking has been very annoying but which can be remedied, it is said, by the use of a Perfect controller. Mr. Brownhill resides at Bergen Point, where gas is \$1.75 per 1000 feet, yet his gas bill, we understand, has been but \$6 for the past month for lighting, cooking and heating water with a Douglas instantaneous water heater for bath and laundry pur-

EVERETT, Mass., is to have a new ordinance governing the ventilation of plumbing systems.

A SECTION of 16-inch wrought iron pipe 20 feet long has been placed at the corner of the building of the Crane Company, Centre and White atreeta, New York, which has the following information: "Crane Company, factories and mills Chicago and Pittsburgh; branch houses New York, Philadelphia, Kanaas City, Omaha, St. Paul, Minneapolis, Duluth, Los Angeles, San Franciaco and Portland, Ore." At all of these branches a full line of pipe and fittings is carried as well as a line of plumbers' brass goods. The city refused to grant a permit to use the 60 foot section of 24-inch pipe exhibited at the World's Fair.

THE MONITOR IRON WORKS, New York, manufacturers of plumbers' cast iron work, soil pipe, fittings, sinks, drain traps, &c., report that they have kept their two foundries running steadily since February. They claim that the care used in making their goods makes their line popular with the trade.

Interest is being taken in improved plumbing systems at Carbondale, Pa.

Patrick J. Riordan, a well-known plumber of Worcester, Mass., was drowned while bathing at Lake Quinsigamond last Monday.

G. H. FARRELL of Westfield, Mass., has engaged the vacant store in Hamilton's Block and will establish a branch of his plumbing business at Chester.

Jos. ALLARD will carry on the tin rooting and plumbing business in Callahan's Block, Southbridge, Mass.

Tue firm of Allen & Marshall, plumbers and tinsmiths, at Greenwich, Mich., has been dissolved by mutual consent, Mr. Marshall retiring. The business will be carried on by D. K. Allen at the old stand on Greenwich avenue.

DAVID WALSH, a plumber, who has held several State offices, died last week at his residence at Hoboken, N. J., at the age of 80 years. He is survived by three sons and a daughter.

THE DETROIT RANGE BOILER COMPANY have filed articles of incorporation at Detroit, Mich., for a company with a capital stock of \$25,000, the incorporators being Thomas A. Parker, Edward W. Stoddard and Arthur M. Parker.

THE ARMSTRONG MFO. COMPANY, Bridgeport, Conn., report from their New York office some activity in their improved pipe threading and cutting machinery, five No. 2 machines having been shipped to different pipe fitters this week. They recently shipped one of their larger machines to the Pullman Palace Car Works, at Pullman, Ill.

THE MORRIS PLUMBING & SUPPLY COMPANY of Houston, Texas, have been incorporated, with a capital stock of \$25,000. Incorporators: B P. Morris, M. W. Kelley, G. E. Van Benthuysen.

THREE ARRESTS were made in Syracuse, N. Y., last week, for violation of the plumbing laws.

C. P. F. GENSLEY and C. L. TANNER have formed a partnership, with shops at 23 West Main street, Newark, O., to do all kinds of plumbing, steam, hot water and gas fitting work.

THE BOARD OF EDUCATION OF MIL-WAUKEE refused to receive bids for the plumbing work for the Emerson from any but licensed plumbers. The contract was awarded to G. R. Bridgman, who bid \$560.

F. L. Cram, representing the Perfection Cleanout Company, Haverhill, Mass., visited the New York trade in the interest of his soil pipe fittings and Cleanout specialties last week.

FRED. ADEE & Co., 90 Beekman street, New York, keeps a piece of vitreous earthenware standing with one end in an inkstand, in order to show visitors how perfectly impervious it is to the penetration of moisture. On being washed off the surface is quite clean, and by chipping it is clearly shown that the ink has not passed beyond the outside. This ware has been adopted in several of the Government contracts for water closets, urinals, lavatories and other sanitary goods.

## MOT WATER. STEAM AND

## The Winchester Heater.

I We show in the accompanying illustration a transparent view of the Winchester boiler, just put on the market by the Smith & Winchester Company of Boston, Mass. Our readers are already familiar with the name of this boiler, for it was chosen by general bal-

18 inch circle is but 561 inches, showing the great increase in the exposed aurface attained by the corrugations. It is pointed out that the corrugations present very little surface against which the coal lies, so that the dauger of chilling the fire is avoided, and there is also provided a free circulation of air at the edge of the fire, insuring thorough com-

Transparent View of Winchester Heater.

lot some months ago, the announcement being made in The Metal Worker at the On examining the cut it will be noticed that the fire pot is constructed with deep corrugations around and over the fire, thus presenting much more exthe fre, thus presenting much more ex-tended surface, backed with water, to the direct radiating heat of the fire than if it were plain. The actual circumfer-ence of the No. 12 fire pot, which has an 18 inch grate, is, we understand, 74 inches, while the circumference of an bustion and economy of fuel. Beginning on a line with the bottom of the fire door and meeting in the center over the fire are corrugations with openings between them, through which the products of combustion rise. The form of the upper sections is clearly shown in the engraving and needs no further description, the flues being staggered in the alternate horizontal sections, so that the products of combustion take a sinuous course and part very completely

CONNTING

with their heat to the water. Particular attention has been given to the cleaning facilities, and the grate is of the anti-clinker, rocking and dumping atyle, easily operated. The boiler is provided with a clinker door, which permits the thorough cleaning of the grate without dumping the fire. The Winchester is made for both steam and hot water, as well as for the combination system.

#### Early Reminiscences in Hot Water Heating.\*

BY JOHN B. FARNSWORTH.

Water Heating.\*

BY JOHN B. FARNSWORTH.

On June 15, 1880, I started, in company with a brother fitter, to see if we could learn something of the methods employed in heating by hot water. We visited in Harvard, Mass., a small two-story building of four rooms, two on each floor. The heating arrangement coosisted of a medium sized upright cylinder stove, such as was used at that time to heat large rooms. Inside of this stove was an upright water tube boiler, or annular, so called, manufactured by Jonathan Johnson of Lowell, Mass. It was made of two hollow cast iron riugs about 15 inches in diameter, one at the top and the other at the bottom. A row of linch upright pipes, about 13 inches long and 2 inches apart, extended from one of these rings to the other, leaving a space on one side of about 6 inches, so that the coal could be put in through the door. This boiler formed the fire pot, taking the place of the fire brick linings. The room on the first floor in which this stove, or combination of stove and boiler, was situated obtained the least benefit of either of the four from the fire. The three other rooms were heated with coils of 1-inch pipe.

A small expunsion tank was placed in the second story and the water, after becoming heated, passed directly to the expansion tank or separator, and from there descended through the different coils and returned to the boiler. It was entirely new to me and the results secured from a moderate amount of coal seemed quite marvelous. I was quite favorably impressed with what I had seen and learned, and coucluded that there was merit in it, which needed only to be more fully developed.

In the following August I visited Mr. Johnson, at Lowell, who was conducting a series of experiments in hot water heating hot water travel through coils in different rooms on the same floor, first passing through one, then down into the basement and up into another, seemingly without regard to what we supposed were fixed laws. This astonished me.

About this time my brother Buerkel began to i

cars by their system, which was somewhat different.

In November I went to Boston and looked over several small jobs of hot water heating, some of which were put in by my friends, Smith & Anthony of that city. In December a Leoninster gentleman called on me and said he understood I was investigating hot water heating, and wished me to heat his house if I thought I could make a success of it. I told him I was deeply interested in the subject and thought I could do what he desired, although I had not tried it. I had confidence ecough to put it into his house on condition that he need not pay for it until he was satisfied it was all right. Also, if it did not work all right and satisfactorily, I was to take it out without any expense to him.

<sup>\*</sup> Presented at the convention of the Master Steam and Hot Water Fitters' Association of the United States, held in New York, June 19-21, 1894.

I put in a Johnson boiler, 30 inches high I put in a Johnson boiler, 30 inches high by 22 inches in diameter, and pipe coils in four rooms. It was a complete success, even beyond my most sangnine expectations. About a week after the job was completed he came into my office and said he did not want it taken out, was perfectly satisfied, and paid me for the job before leaving. I was quite elated at this my first attemnt.

Later on I changed the wall coils for Later on I changed the wan cons for Laffin radiators in the chambers, and put pipes under the floors to heat the two rooms on the first floor. The boiler continued to give satisfaction for about ten years, when

rive satisfaction for about ten years, when I changed it for one of my own make, of which I will speak later. This job has always been satisfactory from first to last. The only radiators I knew of then for hot water were the Whittier, made by the H. B. Smith Company, and the Laffin, made at Westfield, Mass. I was told that hot

and was heated to 72° with 11% tons of coal

and was heated to 72° with 11′2 tons of coal per month during the winter of 1881-82. This job has given the best of satisfaction. The first boiler lasted about six years, when another of the same kind was out in its place. This one lasted only about five years, and was replaced by a No. 3 Spence. In November, 1881. I put a Johnson boiler into the American Express Company's office in Boston. The following December I went to Fall River, Mass., where I saw a job put in the Custon House and Post Office by Bartlett, Hayward & Co. of Baltimore, Md., and I noticed some points where I thought I could improve on that, even with my limited experience compared with theirs.

In February, 1882, I went to Portland, Maine, to see Kenneth McDonald. He was making and using an upright cylinder boiler made of boiler iron, with about I inch of water space between the shells.

I wanted to put this under pressure, but the Gurney people would not allow me to do it. I then put in one made by E. N. Gates of Holyoke and later of Fitchburg, and by running it under pressure I succeeded in heating the house. The Gates boiler was made of 3-inch pipe about 8 feet long, set in brick on a slight inclination, with the fire under the higher end.

I thought I could improve on the Gates boiler, so I designed and built several, using Py-inch pipe instead of 3-inch, and varying the arrangement very materially from his. There were some very good points about this, but I gave it up after a short time. I have since tried many different kinds of boilers, but have probably put in about twice as many of the Spence as of all the others put together. I find no trouble if the boilers and radiators are of sufficient capacity and properly put in. I know of but one hot water job of all I have put in that has not given good satisfaction and has not continued in use to the present time.

I have already alluded to the fact that the furnace men formerly ridiculed the idea of heating by hot water, but now nearly or

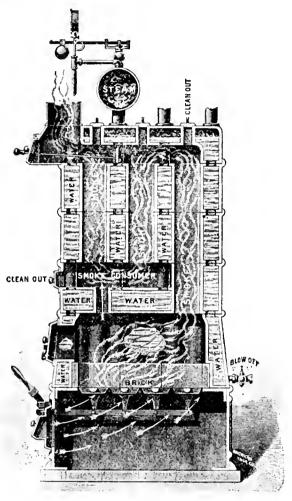

I have already alluded to the fact that the furnace men formerly ridiculed the idea of heating by hot water, but now nearly or quite all of them have a combination heater, and a hot water heater of their own, verifying the old saying that "straws show which way the wind blows"

I did not intend to bore you with so much

I did not intend to bore you with so much of my personal experience, and I fear it has not been interesting, but after beginning to revive the memories of past years I hardly knew where to stop. I have only attempted to give you some idea of what I had to contend with in the earlier days of hot water heating in eastern Massachusetts. I hope others may have had better facilities for obtaining knowledge, but what I have gained was by hard-earned experience.

#### The Boyce Heater.

We show in the accompanying illustration a sectional view of the Boyce steam, heater, manufactured by A. Boyce, 4512 Easton avenue, St. Louis, Mo. The same atyle of boiler is made for hot water heating, with the excep-Referring tion of the steam trimmings. to the illustration, the general features of the construction will be clearly understood. The base of the heater is so made that the water rises directly from the bottom to the top, and the fire course is such that after acting directly on all four sides of the fire pot section, the products of combustion come in contact with the first crown over the fire pot, then rise through six separate flues surrounded by water to the top chamber, where they spread between two crowns, and return by the same number of flues to the smoke consuming chamber, where it is said all the amoke and gases are consumed. The heated products of combustion finally rise through the six flues to the smoke flue. Upon the sections, and directly communi-cating with them through openings in its underside and top, rests the cap, the water freely passing through each acction and cap with nothing to impede its circulation. All the parts, it is pointed out, are connected by short bolts, which do not pass into the water space. Furthermore, in case of necessity any section can be removed within a very short time with little trouble. Special attention has been given to the matter of cleaning the boiler, the top section being made with two clean outs over each series of flues to admit a brush. The boiler is made in sections, and so can readily be passed through a small doorway, and can, it is asid, be set up in from two to three hours. Reference is made to the large combustion space, which enables the gases to be completely burned. The ateam heaters are made in seven sizes, covering a floor space from 22 x 33 to 33 x 41 inches; hight, 51 and 72 inches, and supplying from 350 to 1800 feet of direct radiation. The hot water heater direct radiation. is likewise made in seven sizes, and adapted to supply from 450 to 2800 feet of direct radiation.

The Boyce Heater .- Sectional View.

water heating had been tried and abandoned 50 years ago. The furnacemen laughed at the idea of heating by hot water; however, I didn't give it up, but kept right on.

In my next experiment I bought of Mr. Johnson one of his smaller heaters, 10 inches in diameter and 14 inches high, and placed it inside of an old sitting room stove I had, and attempted to heat my shop, a room containing about 15,000 cubic feet. In my first trial I got so much pipe on that I could scarcely warm the water, so I took off about half of it, and it worked fairly well, considering what a small affair it was. After a time I got a larger size boiler of the same kind, which was quite an improvement.

the same kind, which was quite an improvement.

The next April I put into a residence in Taunton, Mass., one of Mr. Johnson's boilers, in two parts. one inside the other. The outer one was 22 inches in diameter by 30 inches high, and the smaller one was 15 inches in diameter and about 24 inches high, just coming down to the top of the feed door. I used the Laffin radiators on this job, and had the water flow no through this job, and had the water flow up through a part of the radiators and down through the others. I vented the radiators with large pipes extending above the expansion tank. This house contained sevea rooms

This was surrounded by a sheet iron jacket and set on a cast iron base, arranged like a heating stove, with a direct and indirect draft. The coal was put in at the top, and the heat passed up through the boiler and down around the ontside. I afterward used several of these boilers with good results, and thought they were an improvement over the Johnson boiler. Mr. McDonald insed box coils almost exclusively for heating. I next tried a boiler made by Dr. I. Salmon of Boston, but did not like it. I do not remember it fully, but it was a small apright, with small brass tubes, more for a toy than for business.

I next tried a horizontal tubular boiler entirely filled with tubes. The heat passed first under the boiler, then back through part of the tubes, and returned to the rear through the remaining tubes. It was made similar to the Hawkins boiler of Springfield, Mass. This is still in use and works fairly well, but not up to my satisfaction. Later I tried to put in a cheap job (as I presume some of you may have done), consisting of a small boiler made by Walker & Pratt, and small radiators. During the mild weather in the fall it worked finely, but when the colder weather came on I could not heat the house. I changed this boiler for a Gurney, but could not do it with that.

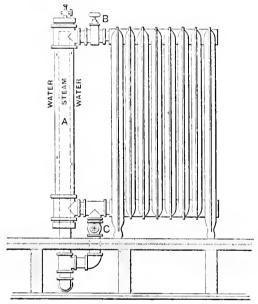

## Hot Water Heating from Steam Boiler.

From Branch Tee, Philadelphia. In The Metal Worker of May 19, 1894, "Rex" shows two systems of piping for circulating water from a steam boiler. The first shows a coil below the water line of boiler; the accord a coil on the floor above boiler. "Rex" is of the opinion that such systems should only be used to meet special requirements. While this may be true of the systems of piping he recommends, it is also true that it can be accomplished in a way that is more practical, and one which will give perfect satisfaction. I do not think it possible to maintain a given water line in the boiler with either of the systems of piping suggested by "Rex," for when the apparatus is in use the air, becoming separated from the water, will find its way to the air chamber, displacing the water, which will raise the water line in boiler and eventually stop the circulation in coil. In order to refill the apparatus, it would

radiator connections, the condensation keeping the radiators full of water. A valve, B, is provided to regulate the flow. The radiator can be operated on the one-pipe steam system by opening the emptying valve C. The use of this device enables the radiator to be used for steam or water heating. The cut shows the principle in its experimental stage, but it will soon be manufactured and placed on the market with the steam riser cast in the center of the radiator section. In a radiator 38 inches high the steam riser will maintain a temperature of 186° in a 60-foot radiator, while in a smaller radiator it is possible to maintain a higher temperature.

#### HEATING NOTES.

As a RESULT of some consideration of the subject of forming a boiler association composed of the manufacturers of steam and hot water boilers, a call has been issued for a meeting for the purpose at Taylor's Hotel, in Jersey

Hot Water Heating from Steam Bouler.

be necessary to flood the boiler, as no controlling valves are provided. As it is impossible to hold the water in the air chamber for any length of time when the water in boiler is at boiling point, both systems would be found a source of continual annoyance. The coil on same level as boiler would circulate if the flow pipe is taken direct from boiler (below water line), always descending until connected with boiler at bottom. As a connection of this kind prevents air accumulation and can be controlled by connecting a valve on lower pipe near boiler, it would be advisable to dispense with the overhead flow and air chamber.

The inclosed sketch shows a device for water heating from a steam boiler which has been used with success. While the principle of heating and circulating water with steam radiation has long been in use, this ingenious application has many advantages, requiring no expansion tank or refilling. It is also possible to maintain steam temperatures; as the radiator is closed, the same pressure indicated by gauge on boiler can be obtained at radiator; at least, the same pressure that would be obtained if an ordinary steam radiator were employed.

By referring to the sketch, it will be seen that the steam riser A is open on top and extends to the top of upper

City, N. J., near the Pennsylvania Railroad Company's ferry, at 10 o'clock next Monday morning.

Since the opening of the sample room by the J. H. McClain Company, Canton, Ohio, at 69 Centre street, New York, Manager G. R. McCallam reports an increasing interest in the Cambridge, Humber, Harvard, Yale and Sandow steam and hot water heaters. The men who install such goods are frequent visitors and the interest they show is manifested in the sales that are being made.

HART & CROUSE, Utica, N. Y., are sending out very serviceable souvenirs to the trade in the form of blotters carrying a modest announcement of their firm and names of their styles of heaters, which include hot water, steam, hot air and combination.

AT THE ANNUAL MEETING of the Adams Radiator Company, Reading, Pa., the following directors were elected; D. L. Adams, F. S. Seaman, J. S. Seaman, Wm. H. Clark and Philip Zieber.

F. RICHTER & Son, 382 to 400 Sixth street, Milwaukee, Wis., have secured the contract for heating an eight-flat building for W. A. Holbrook with one No. 3 12 section Richter boiler; also the heating of the P. H. Loftus flats with a No. 2 13 section Richter boiler.

They report quite a brisk demand from the trade in the past month for both ateam and hot water boilers. They are now placing on the market a new sectional portable boiler at a very low price, to meet the demand for a good article less expensive than a brick set boiler.

THE INTERESTS of the Standard radiators, made by the Standard Radiator Company, Buffalo. N. Y., are well taken care of by C. F. Gessert at 42 Dey atreet, New York. A number of carload shipments have been delivered as a result.

J. A. GORTON of the Gorton & Lidgerwood Company, 96 Liberty street, New York, is taking a vacation in the mountains of New York State, recuperrating his energies to take an active part in the heating trade with the Gorton steam and hot water boilers next fall.

THE UNITED STATES RADIATOR COM-PANY, Saltaburg, Pa., write us that they are now ready to fill promptly all orders for radiators that may be placed with them. They have made a series of tests of their goods, and are prepared to guarantee their radiators to do the work claimed for them.

W. H. Russell is fitting up an office and showrooms at 89 and 91 Centre street, New York, where he will manage the New York business of the Niagara Radiator Company of Buffalo, N. Y., and will soon be prepared to handle promptly all orders for radiators, either direct or indirect, which he secures. He is also representing the Detroit Lubricator Company, Detroit, Mich., steam and hot water quick working radiator valves of the angle pattern, with or without unions, and made of steam metal. The Detroit quick opening steam valve works on the piston principle, opening or closing by a push or pull. When closed by a push down it is tightly seated by a turn on a cam and is also locked.

W. HARRY DEWEY, formerly with W. F. Porter & Co., Minneapolis, is now the assistant engineer of the American Boiler Company, 94 Centre street, New York, Percival H. Seward, who also spent some time with the Minneapolis firm, being the engineer in charge.

GEO. FRANKLIN, 142 Centre street, New York, in addition to his heating business with the Mahony boilers, makes a specialty of piping hydraulic elevator plants. He now has contracts for the aewage and discharge tanks, pumps and piping for the elevators in the new Hotel Majestic, at Seventy-second street and Eighth avenue, and the McCreary building at Twenty-third street and Slxth avenue. His pipe cutting and threading plant is supplemented by a well equipped machine blacksmith shop, with several forges, a steam hammer and cutting shears. A sample of the capacity of the shop to bend pipe is shown gilded, hanging as a sign at the street entrance, composed of three different sizes of pipe welded together and ingeniously bent into a coil, a spiral, a return bend coil placed at different angles to each other, and connected in a compact space by other fantastic curves.

The McGuiness Smith Company have been incorporated at Pittsburgh, with \$100,000 capital. The company will manufacture and sell all kinds of steam, hot water and air heating and ventilating appliances. Directors: William K. McGuiness, Allegheny; Robert S. Smith, Joseph A. Langdon, William F. Hughes, Robert Munro, Pittsburgh.

## The Edgar Hydraulic Molding Machine.

The Edgar-Nelson Foundry Company of Mobile, Ala., build a molding machine in which the flask support is provided with a series of openings through which the patterns can be raised by hydraulic pressure and can be withdrawn from the mold when the pressure is removed. The head plate, flask support and pattern support are operated by hydraulic pressure. Journaled in the base plate A is a horizontal shaft, a, to which are attached the vertical rods  $a^1$ , connected at their upper ends by a cross piece carrying the head plate  $a^3$ . This shaft is operated by the hydraulic piston  $a^4$ , Fig. 1, and carries a weighted lever,  $a^5$ , Fig. 2. The main hydraulic cylinder B is mounted upon

A water pipe, E, is arranged within the cylinder D and passes through the table C into the cylinder  $c^1$ , whereby water is led into the cylinder to operate the ram  $c^2$  and elevate the plate.

Screwed upon the upper end of the cylinder  $c^1$  is a collar, M, through which the ram works. This collar is adjustable and regulates the distance the pattern plate shall drop upon the removal of pressure.

From the water supply cylinder F, shown in section in Fig. 3, water is admitted to the main cylinder, the supplemental cylinder and the horizontal cylinder for operating the head plate by means of a valve, G. The main and supply cylinders are connected by means of pipe f; the supplemental cylinder by means of a pipe, f, and the horizontal cylinder by the pipe f, and f indicates the supply pipe and f the

are held in such position. By continuing the revolution of the wheel the valve is moved to admit water to the horizontal cylinder which operates the head plate, and this movement of the wheel will be limited by the stop in the groove contacting with the rod  $\hbar^2$  bearing in the groove. The moment, however, that the head plate is raised rod  $\hbar^2$  drops ont of the groove and the revolution of the wheel may be continued, admitting water to the main cylinder, which raises the table C, flask support and pattern plate. By reversing the movement the flask support is lowered, the head plate is thrown back and the patterns withdrawn through the openings in the flask support or stripping plate.

It will be seen that by means of a single valve the patterns can be quickly and easily raised and pressed into the

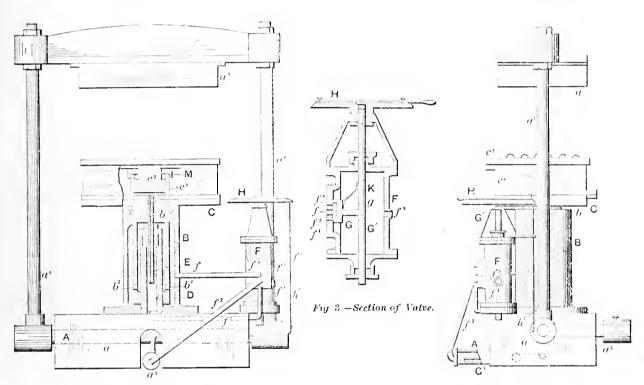

Fig. 1.—Sectional Front Elevation.

Fig. 2.—End Elevation.

## THE EDGAR HYDRAULIC MOLDING MACHINE.

the base A, and within this cylinder works a ram, b, carrying the table or platform C upon ita upper end. Upon the table is a second cylinder,  $c^1$ , carrying a ram,  $c^2$ , supporting a pattern plate, the pattern being arranged upon the upper side of the plate. A casing,  $c^4$ , surrounds the cylinder and is bolted fast to the table C. The casing is provided with a top,  $c^5$ , which aerves as the flask support, and this top is provided with a series of openings corresponding to the shape of the patterns, and through which the patterns are raised when the ram  $c^2$  and supporting plate are raised independent of the table and casing.

In order to raise the pattern a supplemental hydraulic cylinder, D, is provided upon the base A, this cylinder being arranged within the ram b, which raises the table carrying the pattern or flask support. The lower portion of the ram b, which envelops the supplemental cylinder, is formed with openings  $b^2$  to permit the entrance of water into the ram when it is desired to raise

the table C.

exhaust. It will thus be seen that there are five ports to the water cylinder, and coacting with four of them is a single valve, G, having a horizontal stem, g, which is attached to a vertically movable rod, G', working in the cylinder and provided at its upper end with a hand wheel, H, which has an annular groove in its under side, and within this groove is a stop placed at a predetermined point.

A vertical shaft, h<sup>2</sup>, is attached at its lower end to the shaft a and its upper

A vertical shaft,  $h^{\circ}$ , is attached at its lower end to the shaft a, and its upper end is adapted to rest in the groove when the head plate is thrown back out of use. A spring, K, is interposed between the rod and valve to keep the valve in place when the cylinder is

empty.

The valve is ausceptible of four diatinct movements, and by turning the wheel H one-eighth of a revolution the port governing the pipe f is opened and the supplemental cylinder to the cylinder c raises the ram c and pattern plate, thus forcing the patterns are now in position to be forced into the sand and

mold, and then by reversing the valve the patterns are withdrawn and the parts brought back to their original position.

The following shows the condition of the crops, according to the Government report, for the past five years:

	1894.	1893.	1892.	1891.	1890.
Corn	95.0	93.2	81.1	92.8	93.1
Winter wheat	83.9	77.7	89.6	96.2	76.2
Spring wheat	68.4	74.I	90.9	94.1	94.4
Oats		88.88	87.2	87.6	81.6
Rye		85.3	92.8	93.9	92.4
Barley		88.8	92.0	90.9	88.3

Tobacco		93.0	92.7	91.1	88.2

Chicago's record of fire alarma for the first ten days of July is noted as being somewhat unprecedented in the history of the Fire Department of the city. During that time there were 638 calls for apparatus. The fire patrol system, too, was kept on a constant move.

The United States now number 45, President Cleveland having on Monday signed the bill admitting Utah to Statehood.

## ROOFING AND CORNICE.

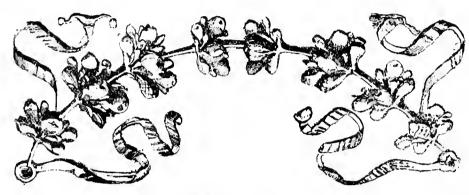

#### Grand Rapids Metal Work.

A few illustrations are herewith given of sheet metal work manufactured by the Metal Stamping & Spinning Company of Grand Rapids, Mich. This is a young establishment, which has made very rapid progress since it was started and is now turning out a great variety

left intact along one side of the opening, but turned out at right angles to form a flange. These openings are  $2 \times 1^{n_g}$  inch in size and are  $\frac{6}{2}$  inch apart. The flanges serve a twofold purpose: 1, By stiffening the lath the whole length of the sheet, and, 2, by making the lath self furring, as the flanges rest on the joists or studs. The

THE BAY STATE METAL WORKS, at Cambridge, Mass., had a fire last week that damaged their plant to the extent of \$8000, which is fully covered by insurance.

ALLEN'S CORNICE & CORRUGATINO WORKS, 422 and 424 West Randolph street, Chicago, are adding a accond

Grand Rapids Metal Work .- Fig. 1.-Garland.

of patterns in sheet metal ornamenta. The illustrations herewith given comprise a garland, Fig. 1; a capital, Fig. 2, and two panel acrolls, Figs. 3 and 4. The scrolls are made right and left—that is, the scroll atarts from a given point both in the right and left direction. These are absolutely new designs brought out by the company, which, as well as hundreds of others never before reproduced in metal for architectural ornamentation, are shown in their new catalogue.

The company have just built an addition to their factory and have put in three new atamping presses made from apecial patterna for their exclusive use, enabling them to atamp 36 inches aquare. These new presses have in each case their own steam cylinders, and are especially adapted to the finer grades of metal stamping. They make a specialty of work to order, and employ highly skilled workmen for this branch of their business.

The atcel ceilings shown in their new catalogue are made from best cold rolled and pickled ateel, and are furnished dipped in paint ready to put up, only needing a finishing coat to present a highly ornamental appearance. They will be pleased to furnish the trade with copies of their new catalogue.

#### FLASHINGS.

THE STANDARD METAL LATH COMPANY, 45 West Lake street, Chicago, have brought out a new pattern of metal lath which they are manufacturing by apecial machinery. A peculiarity of this lath is that it is made on the lines of the common wood lath, which, it is claimed, has been shown by long experience to be the best in form for a plastering aurface. The Standard metal lath preserves this form and adds the fire proof quality. It is made of sheet steel in pieces 8 feet long. Openings are punched through the steel in parallel lines, with the metal

manufacturers atate that with this lath plastering can be properly finished in two coats, thus effecting a considerable saving. The sheets are coated with a prepared oil, which immediately hardens and prevents rust and stain while the mortar is wet.

G. A. Welling, Columbus, Ohio, is sending out circulars illustrating and

atory to their main building for the purpose of carrying in atock from 3000 to 6000 feet of corrugated conductor pipe and gutters. They have found it extremely deairable to carry a large atock of goods of this character, so as to be prepared to fill orders of any size and make prompt shipment. This establishment is enjoying a good trade at present, which is due largely to the

 $Fig.\ 2.--Capital.$ 

briefly describing the Peerless cut off for rain water conductors. The advantages of the cut off are noted, and a price list of the different sizes in plain and galvanized iron is given, 3, 4, 5 and 6 inches of each being manufactured. enterprise of the owners in putting in the most improved machinery and preparing to meet every requirement of the trade with accuracy and dispatch.

Among the contracts recently taken by J. J. Colvin, 28 Chicago avenue, Chicago, can be mentioned the following: Copper and slate work for residence of Murray M. Brown, Washington Boulevard, near Garfield Park; galvanized iron, tin and slate work for flat building of James Kearns, Richmond and Division streets; copper and tile work for residence of H. Woolf, 375 Ashland Boulevard; tin and copper work for residence of Mrs. R. M. Matson, North Edgewater.

Gustav Burkhard, 942 North Clark street, Chicago, has the contract for

increased during the year from \$1,391,457,053 to \$1,563,022,233, being an increase of \$171,565,180. The total of dividends paid was \$100,929,885. The total number of passengers carried during the year was 593,560,612. Passenger mileage during the same year was 14,229,101,084. The number of tons of freight reported by the railways was 745,119,482. Ton mileage was 93,588,111,833. Passenger train mileage was 335,618,770 and freight train mileage 508,719,506.

look perfectly plain. When a ray of sunlight is reflected from them to a screen, however, a pattern appears on the screen in dusky lines. These "magic mirrors" were invented by the Japanese, who engrave a pattern on the back of the mirror and then polish the front. "The portions corresponding to the raised parts on the back stand up more rigidly to the polishing tool and therefore suffer a greater reduction, the evidence of which is afforded by the reflected beam." Mr. Kearton's mirrors

furnishing the copper and slate work for the new Catholic church at Lake View.

## Railway Statistics of the United States.

The sixth atatistical report of the Interstate Commerce Commission for the fiscal year ending June 30, 1893, which has just been published, shows that the total mileage of railways in the United States on June 30, 1893, was 176,461, being an increase during the year of 4897 miles. Washington State takes the first place in new construction with 556 miles, Montana showing 409 miles, Minnesota 406 miles and West Virginia 365 miles. Nineteen roads were abandoned during the year. The total length of line, including all tracks, was 230,137 miles, which embraces 10,051 miles of second track and 42,043 miles of yard track and aidings.

The total number of railway corporations in existence was 1890, being an increase of 68 during the year. Of this number 752 were independent operating The gross earnings from operations on the railways of the United States for the year was \$1,220,751,874, being an increase of \$49,344,53t over gross earnings reported in the previous year. Operating expenses during the year were \$827,921,299, being an increase of \$46-923,303 over the previous year. The final net income available for dividends was \$111,058,034, being a sum less than the corresponding amount for the previous year.

One hundred and seventy-three more railway employees were killed during the year than those killed during the previous year, the total number being 2727. The number of employees injured was 31,729, or 3463 more than the number injured in the fiscal year 1892-93. Seventy-seven less passengers were killed and two more were injured during the year than in the previous year. The numbers were: killed, 299; injured, 3229.

On June 13 the Royal Society of England gave a soirce during which a number of interesting things were ex-

are prepared in a different manner. He etches the pattern on the face of the mirror, and then polishes the mirror till the pattern is no longer visible. It will still show, however, when the ray of sunlight is reflected on a screen. Prof. C. V. Boys showed photographs of the apparatus used by him to determine, the average specific gravity of the earth, the apparatus itself being too delicate to be brought to the hall for exhibition. His method is substantially the same as that used by Cavendish, a century ago, except that the present apparatus is far more delicate and accurate. Professor Boys has been working on this problem for five years, and he finds that the specific gravity of the earth, taken as a whole, is 5.527. It is believed that this result is correct to within one-fiftieth of 1 per cent. It is certainly by far the best determination of the specific gravity of the earth that has yet been made.

The Chicago City Council has given rights in all streets to the Universal Gas Company, but insists on \$1 gas and 10 per cent. of receipts to the city.

The committee of the Board of Education of Erie, Pa., recommended a contract with the Pennsylvania Gas Company for furnishing gas for fuel for heating the following schools from October 1, 1894, to October 1, 1895, for \$3643.55, subject to discount of \$364.55 if paid quarterly in advance. The schools to be hested are Central, Nos. 1, 2, 3, 4, 5, 7, 11, 13, 16.

An International Exposition of Hygiene is to be held at Boulogne, France, from July 15 to September 15.

The Bureau of the American Republica has received from Cayenne advices of the discovery of rich gold deposits on the frontier of the disputed territory between French Guiana and Brazil.

The Marine Review says that tonnage passing through the Sault Canal this season has been very heavy, on account of the great bulk of the largest vessels of the lake fleet being engaged in carrying ore from the head of Lake Superior.

Fig. 4.-Panel Scroll.

roads, and 939 maintained operating accounts. The tendency toward some form of consolidation during the year was marked; 28 roads, representing 749 miles, were merged; 20 roads, representing 1732 miles, were reorganized, and 16 roads, representing 1469 miles, were consolidated.

The total number of employees in the service of railways on June 30, 1893, was 873,602, being an increase of 52,187. The aggregate of property properly classified as railway capital was on June 30, 1893, \$10,506,235,410, which shows railway capital equal to \$63,421 per mile of line. The amount of investment in the railway securities

hibited. J. W. Swan showed some apecimens of gold leaf prepared by him, which are only .000004 inch thick. They were made by electroplating with gold on some of the wonderfully thin sheets of copper that Mr. Swan produced in a similar manner some years ago. After the gold had been deposited the copper foil was dissolved away by perchloride of iron, leaving only the gold. The gold leaf so prepared has a thickness of from one fifth to one-tenth that of the thinnest films that can be produced by the old fashioned process of beating. J. W. Kearton exhibited some "magic mirrora" which he had made. These mirrors are metallic and

# TIN PLATES.

## Additional Tin Plate Brands.

The following names of American tin and terne plates, made specially for Hibberd, Spencer, Bartlett & Co. of Chicago, were received too late for inclusion under the head of "Dealers' Special Brands" in the American tin plate brand list published in The Metal Worker of July 7:

BRIGHT CHARCOAL PLATES.

Pawnee. (Alloway grade.)

BRIGHT COKE PLATES.

Old Hundred. (100 pounds, J. B.

grade.) R. W. B. (Full weight, J. B. grade.)

TERNE PLATES.

Iroquois. (206 to 216 pounds, machine squared.)

Niagara, (Full weight, machine squared.)

Toluca. (Full weight, stamped and

resquared.)

Messrs. Hibberd, Spencer, Bartlett & Co. inform us that these American plates have established for themselves quite a reputation in the West, and are in very active demand at the present time.

## British Tin Plates in 1893.

A special report on the tin plate industry of Great Britain during the year 1893 has just been published in the Bulletin of the British Iron Trade Association. The report contains some information and statistics, particularly in regard to the relations of the Welsh tin plate trade with the United States market, which will be found interesting and valuable as coming from a presumably reliable source.

## Decrease in British Exports.

It runs as follows: "The condition of the tin plate industry of Great Britain in 1893 is generally indicated by two facts—the first, that the exports fell from 395,580 tons to 379,233 tons, and the second that the value of the exports of 1893 fell to \$23,962,925, as compared with \$25,585,037 in the preceding year, being a drop of \$1,622,-112, or over 6 per cent. The chief item of decrease for 1893 appears in exports to the United States, and it becomes a question of considerable interest, and of not a little importance to the tin plate industry of South Wales, whether this decline was a function of the growth of the tin plate trade of that country, due to the higher rates of duty charged under the still current McKinley bill, or whether it is a result of the general depression which characterized the American trade of 1893."

#### American Output.

The report then traces the development of the American tin plate manufacturing industry, from its birth, under the fostering care of the McKinley tariff, in the third quarter of 1891—when the total production of tin and terne plates in the United States amounted to 827,000 pounds—to the end of 1893, when it assumes the output to be at the rate of about 100,000,000 to 120,000,000 pounds a year, or about one-sixth part

of the total imports. As a matter of fact, the total production of American plates in 1893 reached 123,600,000 pounds; and the present rate of production is undoubtedly considerably above that figure, for the two latter quarters of 1893 were marked by severe depression in this, as in all manufacturing industries.

## British Shipments to the United States.

The following table is given, showing the imports of tin and terne plates into the United States for ten years, to 1893, with the official customs valuation and average value per pound:

			Average
			price per
			pound at
			Politica
	Imports.	Value.	port of
	01 = 1,000	(1 = 1,000)	shipment.
			Cents.
Year.	pounds.)	dollars.)	
		18.182	3.6
1884			3.3
1885	507,154	18,665	
	****	17.654	3.1
1886	010,600		3.0
1887	572,220	16,910	
		18,979	3.0
1888	634,944	10, 10	
1889	735,779	21,222	3 0
		20,928	3.0
1890	680,060		
1001	.1,036,489	35,746	3.0
			2.9
1892	422,176	12,315	
	202 495	17,565	2.8
1602			

Commenting on this exhibit, the report remarks on the large drop in both the volume and value of the imports of tin plates into the United States as between 1891 and 1892; which it naturally attributes to the flooding of the market with these goods just prior to the imposition of the high tariff; and the consequent falling off in the demand from importers during the succeeding 12 months. Nevertheless, it is pointed out that if the aggregate imports for the three years ending 1893 are taken, they amount to an average of over 695, 600,000 pounds per annum, which is a larger importation than that recorded for any previous three years in the history of the trade.

## Outlook for Welsh Plates.

Taking this, and the fact that the importations of 1893 were only exceeded by those of four other years, into consideration, the writer of the report considers it only right to assume that the McKinley tariff had, up to the end of last year, "not greatly hurt the tin plate industry of Walea." Nor, with the prospect of a reduction of the duty by one-half, does he believe that further injury can be expected to the Welsh industry from that source. The most menacing thing appears to be the competition of American makers; and, in order to determine the question of how far this is likely to affect the Welsh makers in the future, a comparison is attempted between the cost of the production of tin plates in the two countries concerned.

#### Cost of Production.

This comparison can, however, be hardly taken as conclusive, so far as relates to this country, being based on estimates made over two years ago. Since that time the cost of production in the United States has, undoubtedly, diminished, through the introduction of labor saving machinery and the reduction in the price of black sheets. However, as a matter of curiosity, it may be noted that the estimated cost—

given in the report and obtained from Joseph D. Weeks of Pittsburgh, and the manager of one of the largest mills in Wales-of producing 161 boxes (IC 14 x 20) of tin plates, which is about the equivalent of a ton, would be \$49.14 in South Wales and \$80.62 in the United States. Thus the cost of production in the latter country, according to this estimate, would be almost \$32 per ton more than the cost on the other side of the water. This, the report calculates, would be about the amount of duty per ton under the revised tariff, which would very nearly equalize the cost of the British and American product and place them on a par in the United States market. "In other words, apart from the ocean freight, the two countries would be pretty much 'on an even keel' in respect to the price at which they could supply tin and terne plates to American consumers. Under these circumstances, it would be 'the race to the swift,' and South Wales may hope to be able to retain her hold on American markets if she can keep down the coat of produc-tion at home."

## British Production and Exports.

No reliable statistics are available to show the total consumption of tin plates in Great Britain, but it has been estimated by a writer in the Statist at 2,500,000, or about 40 per cent. of the consumption of the United States. The same writer gives the following statement of the exports and home consumption:

Exported to: United States Russia Canada Australasla France Germany	Tons. 319,100 22,700 16,150 6,150 5,500 5,480 4,100	4.2 3.0 1.1 1.0 1.0 0.8	of total ex- ports. 76.0 5.4 3.8 1.5 1.3 1.3
Holland Other countries.	40,500		9.7
Total	399,680	77.0	100 0
British coosump-		23.0	
Grand total	524,680	100.0	••••

This table, observes the report, shows the great preponderating importance of the United States as a market for our tin plates. It also shows how relatively inferior are the Australasian colonies and British North America, and suggests the probability of greatly extending our trade with those possessions in the time to come.

## A Canadian on American Tin Plates.

A prominent iron manufacturer of Montreal, quoted by Canadian Hardware, who has recently returned home from a visit to the tin plate districts of the United States, expresses himself most favorably as to the success and progress of the American tin plate manufacturing industry, as it came directly under his notice. "It is beyond cavil or dispute," said this authority, "that the business of manufacturing tin plate across the lines is in such a position as to fear no competition or revenue com-

plication. The present condition, despite the general depression of business, is fairly encouraging, and it is only another line of the iron trade in which American industry at some day in the near future bids fair to become a keen competitor in the markets of the world.

"I learned generally in the course of my tour," he continued, "that imported tin plate was used only in such cases where the domestic plate was unobtainable. In fact the latter is rapidly becoming the choice of American users. It is noteworthy, also, that the bright tin plate product of American manufacture appears to be making its way into the home markets upon its own merlts. It has outdistanced expectations, in fact, in quality, while the popular impression that it would never equal the imported plate has been dissipated. Improved machinery is being constantly devised in this as it has been before in other iron lines, and this is giving the American tin plate manufacturer an advantage over his Welsh competitor, who, for various reasons, is tied to old fashioned methods."

#### SCRAP.

"THERE HAS BEEN a remarkable growth in the demand for high grade roofing plates in New York City in the last year or two," said a large tin plate merchant of this city lately. "In almost merchant of this city lately. all the new buildings that are going up the architects stipulate that nothing but the best terne plates must be used; and very frequently the specifications call for the domestic product in preference to imported material. Consequently I have, this year, sold more high grade roofing plates than those of ordinary quality." In this respect New York contrasts curiously with the sister city of Brooklyn, which is said to absorb more damaged plates than any other place in the East. Probably the large amount of cheap and speculative building that has been carried out there lately may account for the preference for cheap material. We have been told of a damaged cargo of roofing plates which had spent some time under the waters of the East River, and which, on recovery, were nearly all disposed of in the City of Churches, finding their way on to the roofs of rows of new houses in the Eastern District. In these houses many of the tin roofs had to be ripped off and replaced with new material before a year was out.

NEW CASTLE STEEL & TIN PLATE COMPANY, New Castle, Pa., resumed full operation this week with all the six tin mills in their rolling mill.

THE SOMERTON TIN PLATE COMPANY of Brooklyn, N. Y., sigued the Amalgamated scale last week.

Among the employees of the New Castle Steel & Tin Plate Company, New Castle, Pa., are a number of musicians, and a brass band has been organized known as the "Tin Mill Band." Recently a number of the officials of the concern were tendered a serenade by their employees, which was highly enjoyed. In referring to these musicians a paper printed at New Castle states that not only has New Castle the best tin plate plant in the country, but it also has the only tin plate plant with a first-class cornet band.

THE Daily Republican of Phonixville, Pa., says that a tin plate works, to be located at the west end of that town, is being discussed, and may develop into a fact at an early date.

AT PITTSBURGH last week Col. J. Collard, assignee of the firm of James B. Scott & Co., tin plate manufacturers, who made an assignment in February last, filed a petition in court asking for an order transferring to him all the assets of that firm. He states that all the creditors, numbering over 100, have agreed to accept a compromise of their claims at 40 cents on the dollar, the claims aggregating \$199,389 35 and the amount to be distributed \$79,755.74. The order petitioned for was granted and the court will name an auditor within a short time. A plan is being considered whereby a reorganization of the firm will be brought about, with Mr. Collard as a majority owner of the stock.

The dog days have brought the usual midsummer lethargy to New York tin plate and metal houses. This season the dullness is, moreover, aggravated by tariff uncertainty and the labor troubles. Many members of the trade have embraced the opportunity to take their vacations, and the majority of jobbers' and dealers' offices present a half deserted appearance, while the unfortunates still there—both pruceipals and clerks—wear anything but a festive air. Things are as dull as they can be, and the future is to them only a matter of languid speculation.

FALCON TIN PLATE & SHEET IRON COMPANY, Niles, Ohio, started in their black sheet mill this week, on the settlement of the wage scale. The company's books contain sufficient orders for black sheets for tinning to keep their mill busy for more than two months to come. Their present capacity in this material is about 100 tons a week.

THE ALYN TIN PLATE WORKS, near Mold, North Wales, have been closed down lately, owing to a dispute with the workmen.

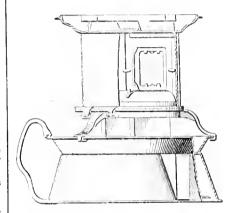

Galveston, Texas, is making strenuous efforts to secure a share of the large West Indian trade, which now passes through New York. A regular service of steamers has been lately established between the port and Cuba, Jamaica, Santo Domingo and other islands of the West Indies. Government work on the jetties in Galveston harbor is being pushed night and day; and it is said that when the bar has been deepened to 18 feet of water the Southern Pacific Railroad will seek the port.

THE FOLLOWING LETTER has been recently sent out by Bryant & Crow, a new firm name for some experienced plumbers, at 296 Sixth avenue, New York: "We regret to announce the death of our partner, William C. Mac-Donald, on June 2, 1894. The undersigned, being his surviving partners, will close up all business relating to the firm of MacDonald & Co. The undersigned have formed a partnership under the firm name of Bryant & Crow, for the business of plumbing and gas fit-ting, to be carried on in the same way and at the same place as the business of MacDonald & Co. Bryant & Crow will assume the carrying out of all uncompleted contracts of MacDonald & Co." Mr. Crow started to learn his trade at this stand 31 years ago and Mr. Bryant began a similar experience four years Both are well known in the trade, Mr. Bryant having invented several plumbing specialties. The new firm are remodeling some of the plumb-ing in the Hotel Netherlands to suit

the wishes of the new occupants and also that in two residences on Seventyeighth street.

Improvement in Lamp Stoves.

The Central Odgas Stove Company, have recently placed upon the market a lamp stove embodying some interesting features of construction, the patent covering which was granted a short time ago to H. P. Wilder of Gardner, Mass. The improvement consists in part of the way in which the cone stand and base are connected together, as well as in the method of holding the chimney in place and connecting it to the other parts. The illustration which we present herewith shows a side view of the stove, also a partial section. Among the interesting features of the stove is a special form of detachable hinge for the purpose of allowing the chimney to awing

Improvement in Lamp Stoves.

entirely back so that its edge will rest on and be supported by the table upon on and he supported by the table upon which the lamp stove is placed. The hinge is made in such a way that the chimney is maintained in pivotal connection with the base or cone stand until the chimney is swung helow the plane of the base, when it can be entirely detached if desired. The cone stand is attached to the base by springing one part into connection with the other, this being the essential feature of the improvement. In this instance the cone stand is provided with lateral and downward extensions in the form of feet which rest upon the upper edge of the base and have hooked projections which extend over and below a bead or flange on the base. By this means the stove is supported and the base, which is made of sheet metal with a flaring upper rim, is prevented from spreading when the stove is subjected to the weight of the articles to be heated. The flaring construction of the base also provides a pan like receptacle in which the wick tubes are located. By apringing the parts into connection with each other no special form of connection or holding bolt is necessary.

In a late edition of Burdett's Official Intelligencer, a London stock exchange manual, the total par value of the foreign stocks held in Great Britain is estimated at the enormous sum of \$3,819,035,000.

An exhibition is projected at Toronto Canada, for next year.

## STORE, TME RETAIL

## The Novelty Metallic Refrigerator.

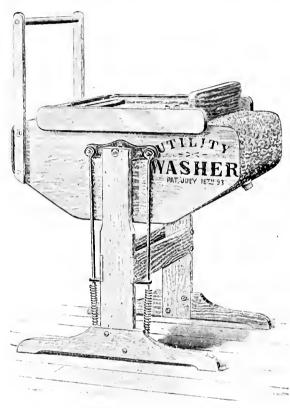

The Novelty Mfg. Company of Jackson, Mich., have put upon the market a refrigerator in whose construction no wood is used. It is herewith illuswood is used. It is herewith indistracted, Fig. 1 showing the refrigerator closed and Fig. 2 showing it open with the parts removed for cleansing. The hight of the refrigerator is 46 inches,

Fig. 1.-Novelty Metallie Refrigerator.

luded. Its diameter is 28 Its weight is less than 150 base included. inches. As no wood is used all shrinking and warping are obviated, while odora are not absorbed and retained. The ice chamber is removable and is made of galvanized steel. The grates are adjustable and revolving, thus making the rear of the shelves as accessible as the front and avoiding the contact of hands or clothing with the contents of front dishes. A galvanized tube conducts the waste from the ice chamber and supports the revolving grates. designed. The outside casing is pan-eled and decorated in an artistic man-

solid wood side pieces with the best of and decorated in an artistic man-With regard to the principles on then accurely nailed with cement coated

Utility Oscillating Washer,

which it is constructed the manufacturers state that it is "a refrigerator in every sense of the word."

## Utility Oscillating Washer.

Olds Wagon Works, Fort Wayne, Ind., are putting on the market the washer here shown. In construction nails, making, it is atated, an absolutely water tight box, which the makers guarantee not to leak. The washer is provided with compensating springs which, it is explained, make the load in the machine itself furnish nearly all the power necessary to operate it, thus greatly reducing the labor of the person greatly reducing the labor of the person using it.

### Magic Self Lighting Lamp Burner.

The accompanying cut represents a self lighting burner put on the market

The Magic Self Lighting Lamp Burner.

by the Magic Introduction Company, 321 Broadway, New York. A flat wick

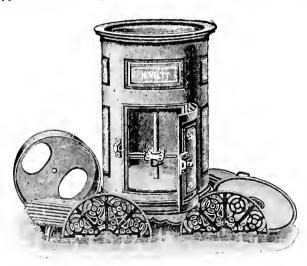

Fig. 2.—Refrigerator with Parts Removed.

All inside parta are galvanized. It is mounted on a solid roller base, hand-somely decorated. The door trim-mings are of polished brass, attractively turned upon the edges, is sealed to the

the machine is described as having the hottom, ends and top made of one piece burner made to fit different sizes of lamp founts is provided with a lighting attachment containing a roll of tape having a series of igniting pellets at intervals along its surface. One end of the tape runs up and over a roller at the top of the lighter, then down, and is attached to the axle of a turn key outside the burner. When the key is turned the tape is moved, bringing a pellet in contact with a steel point at the top of the burner, producing a flash of light, which ignites the wick. When the pellets on the tape are exhausted another tape may be introduced into the lighter. The point is made by the company that the lighting is done without the use of matches, avoiding all danger of burning carpets with match ends.

## The Geyser Coffee Pot.

The accompanying cut is a sectional view of the Geyser coffee pot, manufactured by C. A. Chapman, Clifton Springa, N. Y. A feature of the pot is the internal fountain, consisting of an inverted funnel at the bottom with a tube, which supports a dish with a sieve bottom at the top. The coffee, which is ground coarse, is placed in the

The Geyser Coffee Pot.

receptacle C, and boiling water, to the amount of coffee required, is poured over the coffee and filters through. The pot is then put on the stove, and as the water boils the fountain plays in the way indicated by the arrows in the engraving. The directions are to let it boil ten minutes. The coffee is clear and needs no egg to settle it. The fountain is adjustable, and can be raised to the top of the pot or lowered, at pleasure, according to the amount of coffee needed. The pot is made in two sizes, 5 and 8 pints.

The Chief of the Bureau of Statistics at Washington reports that the total values of cotton, breadstuffs, provisions and mineral oils exported from the United States in the month of June, 1894, and during the 12 months ending June 30, 1894, as compared with last year, were as follows:

COTTON.
1894.

1893.

	\$5,199,161	\$6,859,851
Ten months ended June 30	201,500,000	181,700,000
BREAD	STUFFS.	
June Twelve months ended	\$7,966,820	8t6,437,724
June 30	161,777,730	195,911,615
PROVI	SIONS.	
June	\$17,382,843	\$14,219,681
June 30	174,131,614	161,785,974
MINERA	L OILS.	

The June increase of \$3,000,000 in provisions was thus accompanied by the large falling off of \$8,500,000 in breadatuffs and a slight decrease in mineral oils. Wheat alone showed a decrease

of \$6,000,000. The figures for cotton are for the ten months from the beginning of the crop year, September 1, and show an excess of \$20,000,000. This, with the increase of \$12,500,000 in exports of provisions and cattle, are, however, more than balanced by the decrease in breadstuffs exports for the year of \$34,000,000.

## HEATING DO PLUMBING.

### NEW WORK AND CONTRACTS.

THE AMERICAN CONSTRUCTION & HEATING COMPANY, 69 Centre street, New York, are using five Cambridge steam heaters in some heating contracts they have secured in the uptown residence section of the city.

THE PLUMBING AND TINNING WORK on the new Hotel Chester, Practiville, Pa, was done by John Wilkinson.

Bibs will be received until July 25 by the Board of Public Works of Buffalo, N. Y., for heating and ventilating the 12-room school building to be erected in District No. 50, and to be located on the south side of Eagle street between Jefferson and Grosvenor streets.

CROOK, HORNER & Co. were awarded the contract to put in the steam heating plant and do the plumbing in the Western Female High School Building at Baltimore, Md. The contract figures for the two jobs are \$10,987 and \$2515, respectively.

THE MULLEN & DEMPSET BUILDING, now being erected at Woonsocket, R. I., is to be heated by steam.

THE SCHOOL BOARD of La Crosse, Wis., have let the contract for putting in the apparatus for steam heating the new school building to A. V. Fetter.

THE CONTRACT for placing steam heating apparatus in the High School Building at Eureka, Ill., was granted to McGregor & Co. of Bloomington. The work is to be completed by September 1. The contract price was \$1165.

The Board of Trustees of the Minnesota State Hospital for the Insane, in session at Minneapolis, awarded Chas. Wilkins & Co. of Minneapolis, Minn., the contract for plumbing the addition to the Fergus Falls Institution, at a cost of \$6444. The contract for heating the Fergus Falla Building was awarded to W. F. Porter & Co. of Minneapolis, for \$6743. Samuel I. Pope of Chicago was given the contract to heat the Rochester Asylum for \$2982. The hoard decided to heat both buildings by steam, with natural gas ventilation instead of the blower system.

W. F. RUTTER bid \$809 and secured the contract for placing McShane water closets in the Packard School, and G. B. Smart & Co. bid \$535 and secured the contract for placing the same closets in the Union School at Lawrence, Mass.

HAYES & ROURKE have the contract for the plumoing in a new house being built by S. R. Biatchley at New Haven, Conn.

NEWMAN & CRONIN have the plumblng contract for the new house for the fromas Hose Company, at New Loncon, Conn.

THE LAWRENCE PLUMBING & HEATING COMPANY, Lawrence, Kan., have the contract for heating the new residence of W. C. Winship, on South

Vermont street, by hot water. The plumbing is also to be done by this

THE BRIDGEPORT STEAM HEATING COMPANY, Bridgeport, Coup., have secured the contract for placing a Gurney hot water heating apparatus in the new residence of A. J. Hoyt at South Norwalk.

C. S. EAMES has the plumbing contract for the new residence of Jesse S. Nash at Bridgeport, Conn.

E. RUTZLER, 178 Centre street, New York, has been awarded the contract for the heating and ventilation of the German Hospital at Brooklyn, N. Y.

The School Committee of Salt Lake City, Utah, awarded to P. J. Moran the contract on his bid of \$1293 for direct-indirect radiation with natural ventilation for the four-class room building in the "annex" and the four-class room building in Poplar Grove.

E. DESORMOUX & Co., Springfield, Ohio, have been awarded the contract at \$3915 for a steam heating plant for the new Court House at Wapakoneta, Ohio.

THE J. F. PEASE FURNACE COMPANY, Syracuse, N. Y., bid \$1592 and secured the contract for the steam heating and ventilating plant for the Court House and clerk's office at Lowville, N. Y.

THE CONTRACT for putting the steam heating apparatus in the South Grammar School, at Waltham, Mass., has been awarded to Smith & Anthony of Boston. The estimated cost is \$2400.

Instructions have been given to a committee to have the heating plant remodeled in the Orthodox Church, at Lowell, Mass.

THE CONTRACT for heating, ventilating and plumbing the Northboro, Mass., High School Building has been awarded to the Hub Plumbing, Heating & Stove Company.

THE CONTRACT for placing a heating apparatus in the home of Mrs. Mary C. Wagner, at Ninth and Chestnut streets, Columbia, Pa., has been awarded to the Supplee Steam Engine Company.

THE CONTRACT for a new heater for the Bingaman and Orange Streets School Building, Reading, Pa., was awarded to the Keystone Steam Heating Company.

THE IDAHO PLUMBING & HEATING COMPANY, Boise, Idaho, have secured the contract for the steam heating and plumbing to be placed in the Idaho Soldiera' Home, now in course of erection at that place.

TRINITY CHURCH, at Lewiston, Maine, is to have a steam heating plant.

Amono the orders recently received by the S. Wilks Mfg. Company, 113 to 123 Clinton street, Chicago, can be mentioned the following: Two heaters for the residence of O. W. Norton, 4815 Lake avenue; two heaters for St. Joseph's Asylum, London, Ont.; and two heaters shipped to San Francisco, Cal.

Thomas Weathered's Sons, 242 Canal street, New York, are engaged in erecting a new greenhouse at the White House in Washington. They are also installing two No. 6 and one No. 4 boilers for the heating plant in two new greenhouses and remodeling the piping in another for Peter Hassinger of Newark, N. J. They are using a No. 3 boiler to heat the atore and flat of John Cammail in Brooklyn.

THE HAZLETON PLUMBING & STEAM HEATING COMPANY, Hazleton, Pa., secured the contracts for plumbing the residences of Thomas Powell and William Watkins of that town.

THE CONTRACT for the heating plant for the new residence of J. Frederick Maynar, n w being creeted on the corner of Geneses and Noves streets, Unite, N. Y, has been awarded to the teren Furnace Company of that city. Two Carton hot water boilers will be used, the boilers being set in battery, the same being connected so that one boiler can be used in the spring and fall and two during the winter months. The indirect system will be used almost entirely, the direct system being applied only in the back wing, in the servants' apartments The supervision of this job will be in the hands of William Campbell, an expert who has an experience of 32 years in this line of the heating business.

The Board of Regents of the Normal Schools, at Madison, Wis., will receive bids till July 24, for the steam heating apparatus for an addition to the Normal School Building, at Milwaukee, Wis., and for the addition to the school at Oshkosh.

Bids will be received by the Board of County Commissioners of Blue Earth County, at Mankato, Minn., up to July 24, for heating the new County Jail Building with ateam.

O. L. Anderson of the Lake Superior Heating Company has taken the contract for putting steam heating apparatus in the new St. Patrick's Church, Fort Howard, Wis., for \$1245.

RUFE BROS. have the contract for the heating of Harry S. Beidler's new house, at Doylestown, Pa. They have also contract for the plumbing.

The Harrisburg Steam Heat & Power Company, Harrisburg, Pa., have the contract for heating the State Treasury Building. The bids for plumbing were set aside.

THE PECK-WILLIAMSON HEATING & VENTILATING COMPANY, Cincinnati, Ohio, bid \$4800 and secured the contract for heating the school at Kenton, Ohio.

THE J. L. MOTT IRON WORKS, 311-313 Wabash avenue, Chicago, are to place Star warm air furnacts in the residence of Julius P. Neilson, Robinson and Chicago avenues, and in the apartment house of II. Beyers, 76 Aberdeen street.

THE SMITH & ANTHONY STOVE COMPANY, 217 Lake atreet, Chicago, have the contract for steam heating in the parish house of Trinity Church, Michigan avenue and Twenty-sixth street.

THE THEO. JACOBS COMPANY, 72-74 Market street, Chicago, are to install a steam heating plant in the flat building of Gustav Kurz, 718 Milwaukee ave nue.

GORDON & BLACK, Lansing, Mich., have secured the contract for heating the People's Savings Bank Building. They will use two No. 46 Ideal hot water heaters in twin connection.

The Board of Education at South Side, Ohio, have awarded the contract for the heating and ventilation of their new school building to A. Lotze's Sous & Co.

Some of the heating contracts recently closed by the Blackmore Heating Company, SS John street, New York, in which Gorton and Sunray boilers will be used are the following: The St. John's

Day Nursery, Sixty-seventh street, New York, and the residences of James Thatcher, James Rowland and Geo. M. Alcott. Brooklyn; Lewis Werle. Flatbush, L. I.; J. C. Biglin, Far Rocka way; S. H. Payne, Bay Ridge, L. I.; H. Livingston, Catskill, N. Y.; J. T. Daly, Yonkers, N. Y.; F. S. Cowles, Hasbrouck Heights, N. J.; Chas. Mulford, Jersey City, N. J., and the S. F. & E. S. Swift Company Building at Brooklyn.

JACOB G. WEBER, 244 North Clark street, Chicago, is to do the plumbing, gas fitting and sewerage in the residences of F. J. Dewes and A. Dewitt.

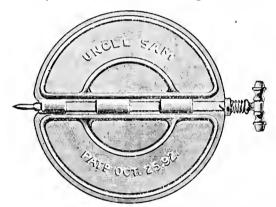

THE JOHN DAVIS COMPANY, 69-79 Michigan street, Chicago, are to furnish two tubular boilers for the Taylor Building, Wabash avenue and Washington street.

PRESIDENT E. W. HERENDEEN of the Herendeen Mfg. Company, who is traveling in Europe, writes the Chicago branch, 131 Lake street, that while in Christiania, Sweden, orders were taken for seven Faultless Furman boilers:

### Uncle Sam Dampers.

The accompanying illustrations show the Uncle Sam dampers, manufactured by Walbridge & Co., Buffslo, N. Y. Gas Heating Apparatus.

The accompanying illustrations show the Vulcan hot water heater, Fig. 1, and the Vulcan hot air furnace, Fig. 2, designed to use gas solely for fuel, whi h are being put on the market by William M. Crane & Co., 838 Broadway, New York, the well known manufacturers of gas appliances. They are constructed entirely of east iron, which, it is claimed, insures their durability, as it will stand the corrosive action of the sulphur compounds that are often found in natural gas and oceasionally in illuminating gas. The hot air heater, Fig. 2, consists of a central round brick lined flue, with the gas burner in the base. This flue extends to the top of the furnace, connecting directly into the center of the dome. The dome is cast in one piece, without joints or bolts, and has air slots through it from bottom to top that extend from its outside to its center. Ten vertical corrugated tubes connect the dome with a circular hollow Ten vertical corrugated tubes conoutlet ring that has an outlet for prod-ducts of combustion. The whole is encased in the usual galvanized casing. There is an opening, with damper, from the dome connected with the pipe to the chimney that is used only when lighting the gas to start the draft up the chimney when it has not been used for some time and prevent accumula-tion of gas in the furnace. The gas

Unele Sam Dampers .- Fig. 1, -Heating Pipe Damper.

Fig. 1 shows the heating pipe damper and Fig. 2 the smoke pipe damper, the engravings showing the differences in construction of the two. The handle of the dampers, which in construction are the same, is of enameled wood and the spring shown at the right of the illustrations will, it is said, always re-

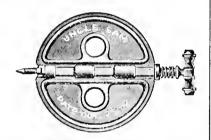

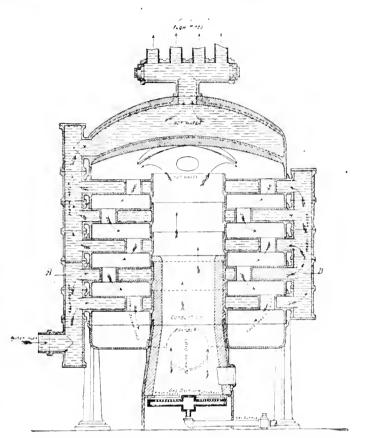

Fig. 2.—Smoke Pipe Damper.

main the same, not being affected by the heat. The stem is of malleable iron, pointed, and can be easily driven through the pipe. The damper plate is of cold rolled sheet steel, the corrugations stiffening it and preventing warping.

An abstract of the eleventh census has been printed, and is now ready for distribution.

burner is constructed so as to intimately mix the gas and air, using, it is said, the least amount of air necessary to effect the complete combustion of the gas. The combustion is completed in the hot fire brick lined chamber, and the highly heated products ascend directly to the top of the furnace, imparting little of their heat until they reach the dome. This highly heated column of gases makes a strong forced draft sufficient to draw in the air needed for the combustion, and to force the products into the open air. As intensity of draft varies nearly as the product of the hight into the difference of temperature, the 4½-foot column of hot gases at 1800° F. would, it is pointed out, give as strong a draft as a chimney 27 feet high at 300° F. The products pass through the dome between the air slots, and thence down through the corrugated side tubes, and as cooled descend to the outlet ring, and pass into a pipe directly to the open air, or to a chimney, as preferred. A large part of the squeous vapor re-sulting from the combustion of the hydrogen in the gas will be condensed in the lower part of the corrugated tubes and outlet ring, and will pass out through the small pipe to the cellar drain or to a vessel, as preferred. The amount of water produced from the combustion of various gases is about as follows per 1000 cubic feet:

Pounds, 63 high, even when the heater is doing ' London coal gas..... much leas than its rating. When a small Natural gas..... 9.2

Gas Heating Apparatus.-Fig. 1.-Vulcan Hot Water Heater,

The taking out of a large portion of the water at this point decreases the weight and volume of the products of combustion, and experience has shown that they can be discharged through a chimney at a low temperature without depositing moisture. The cooling of the products of combustion to a low temperature is assisted by the fact that the incoming cold air to be heated passes first over the outlet ring and lower ends of the corrugated tubes; thus subjecting the products of combustion to the lowest temperature in the furnace as they pass out.

The hot water heater, Fig 1, is constructed on the same general principles as the hot air heater. The ciples as the hot air heater. products of combustion ascend through a highly heated brick lined flue, impinging directly into the bottom of the dome, then descending through the sections to the outlet below lower section. The return water passes through the two lower sections to the dome, which has the supply outlet in its center. In this, as in the hot air heater, the products of combustion are subjected to the lowest temperature in the heater as they pass out. The only water joints are in the columns outside of the heater, always in sight and easily made. The sections are slike, and aize of heater can be changed by increasing or decreasing number of sections.

The manufacturers refer to the following difficulties encountered in applying gas to house heating furnaces: In using ordinary up draft furnaces the tendency of the hot gases to take a direct course up through the heater to the stack without imparting a fair share of their heat to the heater. In these heaters the atack temperature is always very amount of gas is being used in a large heater, and the products of combustion are brought below 212° F., the water it drips back into the burner, also is carried along, condensing in the stove pipe and in the chimney. The conpipe and in the chimney. densation in the chimney gives very serious results, as the moisture pene-trates through the sides of the chimney, staining the walls. There have been two methods used for getting rid of the above difficulties, and both entail a large less of efficiency.

1. Discharging products of combustion from furnace at so high a temperature that condensation will not place until the products have reached the outer air at the top of the chimney.

2. Supplying at the burner a much larger amount of air than is needed for combustion. This air being heated in its passage through the furnace will absorb the vapor and carry it to the top of the chimney provided the temperature is not too low.

While the stack temperature is lower by this method, the volume of the products of combustion is increased and no economy is effected. Sometimes air is admitted by check draft in the stove pipe close to the heater instead of at the burner, but the net result will be the same as in the latter case, as the products when they meet the incoming cold air at the check draft must be hot enough to raise the temperature of the air sufficiently to carry it to the top of the chimney. The Vulcan heater is so the chimney. The Vulcan heater is so designed as to abstract the greatest amount of heat from the products of combustion, and to discharge these products into the open air even when reduced to the lowest possible temperature, or into a chimney without trouble from moisture.

The past winter a Vulcan hot water heater using illuminating gas in New York and discharging the products of combustion at 90° F, to 120° F, into a chimney 50 feet high, with no other con-

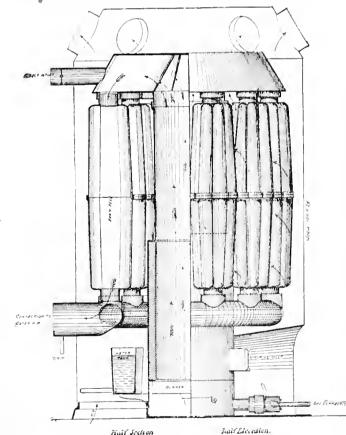

Fig. 2.—Vulcan Hot Air Furnace.

vapor produced by the combustion of the hydrogen in the gas condenses in

nection, gave no trouble from moisture, and over 25 pounds of water per 1000 the heater, even to such an extent that | feet of gas were collected at the heater.

# STOVE TRADE NOTES.

## The Local Stove Trade.

If the boom in business which is bound to come had already arrived, and all the factories, foundries, shops and mills in the country were pushed to their utmost capacity to fill orders, the local stove trade at this time of the year would still be dull. Clerks in the wholesale stores might be kept busy entering orders sent in by out of town salesmen; managers might have to postpone their vacations to study stock sheets and issue orders to their foundries to make some stoves, of which the change in times had turned an overstock into a scant supply, and they might have to make hurried contracts for attachments and trimmings found to be woefully short, but orders for stoves from city or local dealers, either for im mediate use or stock ahead would be scattering and small. The demand would be greater than it is now, but amaller than the general increase would seem to warrant.

Stove dealers in the city now place their stove orders so late, due to the changed conditions in the stove business during the last ten years, which The Metal Worker enlarged upon some months since, that the summer season is one of great dullness. crowded together in the cities must have their summer outing, clerks and saleamen spend their ten days or two weeks in the country, and workingmen their days off at Coney Island or some of the other near-by watering places or summer resorts, and but little money is expended for stoves by the masses during the summer months. Those who cannot afford their usual outing this year cannot afford to buy a stove.

So far as portable cooking ranges are concerned, their sale is so limited it might warrant the belief that nobody is buying a stove to replace an old one in use, but that they are fixing up the old ones till the iron disintegrates, and those that are sold go to newly married couples, and not many of them. It is not uncommon for small dealers to tell the stove salesmen they have not sold a stove for three, four or five weeks.

Not only is the retail business dull so far as the sale of stoves is concerned, but those who do jobbing in tin work complain of its dullness. Last year, when sales fell off, the jobbing held its own and enabled many dealers to pay their bills, but this year that, too, is dull, and the dealer who has several men employed and who usually devoted his time to superintending, must now work himself and is but seldom found

in his store, while the smaller trader, who was formerly absent from his store at work, can always be found, having little or nothing to do.

There is no remedy but to wait. It is idiocy to crowd stoves on the dealers at this time. They do not need them and will incur debts for which wholesalers will have to wait so much longer. Very little activity may be expected before September, and not then if the weather should remain warm, as dealers will delay ordering till the last moment.  $\Lambda s$  to the question of a revival of trade this fall, or the satisfactory proportions of the stove business, it may be a little early to prophesy, though speculation is always in order. Based on the revival after the panic of 20 years ago, revival has gone by for this year, as the boom of 1879 set in early in July, and prices of stoves made two jumps in that month.

To the credit of workingmen of this locality be it said that they have not added complications to the revival of business (should it be due this fall) by ruinous strikes, such as the West has suffered from, and revival will be welcome and unhampered. If pattern shops have been busy during the past months it is too early to note the results, as no new patterns are brought to the dealers' notice hereabouts as yet.

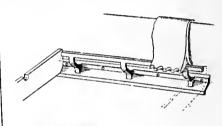

# The Co-operative Foundry Company.

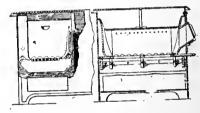

The catalogue and price-list which reaches us from the Co-operative Foundry Company of Rochester, N. Y., is an interesting publication of nearly 120 pages of letterpress, profusely illustrated and printed in three colors. The body of the matter appears in black, the titles of the stoves in rcd and the ornamental corner pieces, consisting of in lavender. oak leaves and acorns, This is the twenty eighth annual cata logue which the company have issued, and in the announcement to the trade they state that the pages of the volume 'indicate the spirit of new construction, of revision of the old and in gen eral of progress." The goods illustrated are made under the name "Red Cross" and embrace an extensive assortment, capable of meeting all reasonable re quirements. The goods are ornamented in a way to please the trade, while the constructive features are such as have established for Red Cross stoves, ranges and heaters an enviable reputation. The Red Cross square parlor heater for soft coal occupies the leading position and is shown in the catalogue in general and sectional views. The Royal Red Cross equare parlor stove, made as a double heater, has been revised to a certain extent in exterior design, the interior construction remaining the same. In addition to a line of oak, Franklin, globe, cannon, cottage parlor, box and laundry stoves, attention is given

to the Bermuda hot water heater and to the Hornet and Bermuda hot air furnaces. The list of hollow ware, prices of North Carolina mica, sundries, &c., together with a comprehensive index, complete the volume. The binding of the volume is in board covers, with side title consisting of the name, address and trade mark of the company in raised white enameled letters upon a marcon ground.

## Improved Fire Box Construction.

A form of fire box possessing features of interest to the stove trade has recently been incorporated in their goods by the Portsmouth Stove & Range Company of Portsmouth, Ohio. The arrangement of parts is such that the fire box and grate are supported in a manner that gives a downwardly ex-

Improved Fire Box Construction.—Sectional Views, Showing Arrangement of Parts.

tending passage, through which the ashes will fall without interruption into the ash pan. Another interesting feature in connection with the fire box is. the construction of the interior, the upper part of the accompanying engraving showing a detail of the supporting rails. with a section of lining in position. The upper edge of the lining, it will be noticed, is curved and forms a lip, which rests on the upper corner of the oven in such a way as to give an air space between the lining and the oven. An inspection of the lower left hand portion of the cut, which represents a cross section of the fire box, will show that the air space is continuous and in free communication with the open space beneath the grate. The air in this space becoming rarefied by the heat, ascends. and passes into the fire box through perforations in the lining, and assists in promoting a thorough combustion of the gases. The lower right hand portion of the cut represents a longitudinal section through the fire box and the parts adjacent thereto. This cut shows that the doorway in the front lining is boxed in such a way as to prevent the escape of heat from the air space and the consequent admission of cold air. The company claim that an additional heating aurface is secured by the transverse recess formed as shown beneath the doorway. The grate is journaled in cross bars, and has a longitudinal as well as a rocking motion. The side bars and end sections, as well as lower edges of the linings, are provided with a series of notches, so that when the grate is moved longitudinally the notches en-gage and crush clinkers and other incombustible matter which accumulates in the lower corners of the grate. Where a water heater is used in connection with the stove the linings are attached to one side and the ends of the fire box, while in stoves having no water heater the linings are applied to both ends and

#### The Gem City Stove Mfg. Company

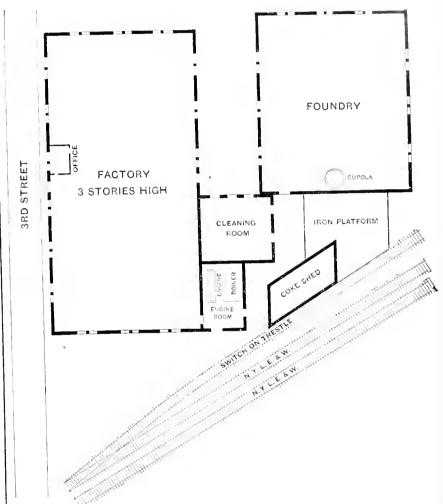

of Quincy, Ill., fazor us with a copy of the illustrated catalogue which they have just issued from the press, relating to their line of Gem stoves and ranges. The printing is in two colors upon good paper, and the binding is in flexible covers, the aide title consisting of the name of the concern and the dates 1894 95 in gilt letters upon a black ground. The opening pages are given up to an exposition of the merits of the American Gem six-hole and four-hole ranges and cook stoves, intended for burning coal, coke or wood. These are ornamented in designs of striking character, and embody those features of construction which experience and the wants of the trade have shown to be eminently desirable. The Golden Gem six-hole and four hole ranges and cook stoves are next considered, these being well made, fitted and finished, and comoine in their construction those features necessary to render them "good bakers, economical in fuel, strong and durable. The other goods include Art Gem sixhole range, made for coal or wood; National Gem six and four hole cook stoves and ranges for wood, these constituting a new line embodying attractive features of ornamentation and the latest features of construction. The Golden Gem, for wood; the American Gem, for coal or wood or coke; Art Gem, Gem and Favorite cook stoves. The heaters are represented by the Gem Starlight, a richly treated Todd stove staringht, a richly treated roud active for burning wood; the Brilliant Gem, a square parlor base burner for soft coal, hard coal or coke; the Gem Oak, a large atove intended for heating churches, school rooms and the like; the Ruby cannon and the Coronet box. Miscellaneous goods, price-list of hollow ware, directions for setting up and operating stoves, a copy of the guarantee which the makers give with each stove, together with an index, in which the various goods are classified and arranged alphabetically, constitute the closing features of the volume.

A PECULIAR ACCIDENT happened on July 12 in Chicago. Two freight trains came in collision on the track in the rear of Burdett, Smith & Co.'a warehouse, at Sixteenth and Johnson streets. The force of the collision was ao great that one of the locomotives was thrown off the track and dashed into the corner of the warehouse, tearing out a good portion of the wall. While considerable damage was done to the building it was confined to a comparatively amall part of it. Two lives were lost in the collision.

# Works of the Hood Furnace & Supply Company.

The engraving which we present herewith represents a ground plan of the new plant occupied by the Hood Furnace & Supply Company of Corning, N. Y. It is some 11 years ago that the president of the concern, C. S. Hood, commenced the manufacture of furnaces in a room 20 x 20 feet, equipped with one drill and an emery wheel operated by water motor. As the merits of his furnaces became known their sale increased, and from time to time Mr. Hood tound it necessary to provide additional manufacturing facilities by removing to

dumped under the trestle within 16 feet of the boiler. The steel for the manufacture of the Chearful Home furnaces is taken by carload lots on the second floor of the main building where it is transformed into heaters ready for shipment. While the plant is not a large one the company feel that it is second to none in its arrangement for the purpose of manufacturing warm air heaters exclusively. The president, C. S. Hood, is the inventor of the Chearful Home and the Cottage Home line of heaters known as the Hood furnaces, and he is also inventor of most of the machinery in use in the company's works. In 1892 C. S. Hood & Co. were organized into astock

Ground Plan of the Works of the Hood Furnace & Supply Company, at Corning, N. Y.

more commodious quarters. Three times changes have been made, bringing the company to their present quarters at the corner of East Third street and the tracks of the New York, Lake Erie & Western Railroad. The main building is three stories in hight and has nearly 20,000 feet of floor space. It is equipped with steam power riveting hammer, forming rolls, a self spacing and punching machine, drills and grinding machines. There is also a tin shop equipped with the latest improved tools and an elevator for the easy handling of stock. The engine and boiler room adjoins the factory building, as may be seen from the diagram. The foundry, which is so located as to receive light on all sides and to be readily accessible to the railroad switch, has a capacity of 4 tons per day. The switch, which is on a trestle, delivers all material, so that coke and iron are unloaded on a level with the cupola floor. Soft coal can be

company with C. S. Hood as president, W. W. Adams vice president, and James C. Hood secretary and treasurer.

#### The Abram Cox Stove Company

of Philadelphia, Chicago, New York and Boston have issued a 48-page pamphlet, supplementary to their catalogue of 1893-94. It is distributed for the purpose of showing the new goods the company have brought out, and within its covers well executed engravings of artistically decorated ranges and heaters are given. Among the new goods may be meutioned the Valley Novelty, for hard coal, soft coal, coke or wood, a six-hole range, richly embellished, and embodying the latest features. The Valley Novelty A is a member of this same class, and possesses features which cannot fail to command the attention of the trade. These two lines

constitute an extensive assortment, and embrace practically every desirable form known to the trade. The makers state that there are no less than 288 separate and distinct ranges, half of which are made left hand and half right hand. These productions are also made with horizontal boiler and high closet, the decorative features producing very attractive effects. The Marvel is the name of a new heater which the company have brought out in three sizes, made with cast iron fire pot and both direct draft and revertible flue. various forms in which the heater is offered the trade by the manufacturers are designated as "direct draft circu lator, direct draft double heater, full revertible flue circulator and full revertible flue double heater." The Pole is another addition to the company's assortment, this being a full revertible flue surface burner with nickel ornamentation.

### Welcome Stoves and Ranges.

We are indebted to the Syracuse Stove Works of Syracuse, N. Y., for a copy of an exceedingly neat and attractive catalogue which they have just issued, illustrating and describing their lines of Welcome stoves and ranges. In the make up of the volume the major portion of the matter is printed in black, with the name of the stove and the date of the pattern in red. In the upper outer corner of each page is an orna-mental piece in light green, carrying a fac-simile of the company's trade mark. The binding is in light colored covers forming a pleasant departure from the dark and somber treatment employed in connection with many trade publica-tions. To the third page of the cover is attached a pocket in which we find a trade price-list of Welcome stoves and ranges, agricultural furnaces and dealers' supplies. The goods illustrated in the catalogue are shown to excellent advantage and the descriptive particulars are such as to enable the trade to understand the salient features of each stove, range and heater. In connection with the cuts are given oven measure-ments, lengths of fire box for wood and the various numbers in which the goods are made. The manufacturers point out as an evidence of the increasing popularity of these goods that their facilities are increasing year by year. The company are also interested in the sale of Kernan warm air furnaces and a portion of the catalogue is devoted to illustrations of these goods. Other features to which attention is invited consist of repairs for stoves made by the predecessors of the company, illustrated description of the improved lock frame stove truck and an alphabetically arranged index.

### The Bridge & Beach Mfg. Company

of St. Louis, Mo., have just issued an attractive catalogue and price-list of Superior stoves and ranges. It is a volume of 112 pages, tastefully printed on a good quality of paper and bound in comparatively plain covers, but with rich effects. The opening pages are given up to illustrations of the company's works at 501-503 South Main street, St. Louis, their California agency at 13 and 15 Bluxome street, San Franciseo, their Oregon agency at Portland and their agency at Los Angeles, Cal. Remsrks relative to stove repairs, breakages and overcharges and a telegraphic code with index are other features of

interest and value. Nearly 40 pages are devoted to Superior cook stoves and ranges embodying the modern features and embellished in a style to command the attention of the trade. These are made for both coal and wood and in sufficient variety to meet all requirements of domestic use. In connection with each cut of a stove are given the sizes in which it is made, the number of boiler holes, weight, price and code word. The heating stoves occupy the second half and include the Superior air tight parlor stove for coal or wood and with single or double fire pot; the Superior oak, made in four sizes; the Elmo, a hard coal base burner; the Lotus, a direct draft soft coal heater; the Keystone and Sligo cannon stoves; an attractive all east Franklin made for burning wood and two sizes for burning coal; the Superior Todd, together with a line of box, laundry and cottage parlor stoves. Attention is also given to high closets, detachable reservoirs, water coils, tin trimmings, price-lists, directions for ordering repairs, &c. A valuable feature of the catalogue are skeleton cuts of a coal cook stove, a coal range, a wood cook and a wood range, the various plates being numbered and each number referring to an explanatory table presented in connection therewith. By this means the dealer can so state his requirements in the way of repairs as to reduce mistakes to a minimum.

# Bussey & McLeod Stove Company

of Troy, N. Y., have issued their annual illustrated catalogue and price-list of Gold Coin stoves and ranges for the season of 1894. In general style and make up it is in keeping with publications of previous years, and its 160 pages set forth in comprehensive style the merits of the goods named. whole page is devoted to a bird's-eye view of the Oakwood foundry of the company, at Troy, while another gives a bird's-eye view of the foundry of the Chicago Stove Works, which are the Western makers of Gold Coin atoves. In pursuance of the company's policy they present this year a complete new line of Gold Coin stoves, embracing a six-hole range, a four hole range, a new wood and coal cook, a new square oak, a new surface burner, a new hall stove and a new E shelf. The Gold Coin stoves are well known to the trade, and have established a reputation at home and abroad. In connection with each cut the dealer will find the various sizes in which the stove is offered, oven dimensions, prices and code words for ordering by wire. The letterpress in every case is ample, and the arrangement of the matter such as to prove valuable to the dealer. The new Gold Coin surface burner is mounted with Russia iron, and the various sizes have respectively fire pots 13, 14 and 16 inches in diameter. sizes are intended for heating halls and large rooms. A valuable feature of the catalogue, and one which is now found in publications of a number of leading stove manufacturers, is sectional views of stoves and ranges, each plate being numbered and referring to an explanatory table printed in connection therewith. By means of the cuts and tables the dealer is enabled to order repairs in the full assurance that the manufacturer will understand exactly what he means and thus save many of the annoyances and delays which have characterized

#### ODD PLATES.

A SHARP CONTROVERSY in regard to the trade in gas stoves is raging in England at the present time between the gas companies and the hardware trade. The former lay claim to the business as their "birthright." Ninety-five thousand gas stoves are now leased out in London by two companies alone.

E. O. & W. K. STAFFORD, 7 West Fourteenth street, New York, Eastern agents for the Milwaukee Gas Stove Company and for the Mosely Folding Bath Tub Company, have found that the Perfection gas ranges and the folding bath increase in popularity as their merits are known. They are also agents for Barler's oil heaters, and expect good sales in the fall. They sell the gas tubing made by Nicholls & Granger in large quantities.

Gas, says the Plumber and Decorator, is very largely used for cooking purposes not only in London but in the country towns. At Maidstone, for instance, at least 28 per cent. of those who use gas have disearded coal for cooking purposes. The gas sent out during the daytime for cooking purposes is 40 per cent. during the summer, and just over 50 per cent. during the winter, of the total quantity of gas made at the works.

FLOYD, WELLS & Co., Royersford, Pa., have placed a contract with John Denithorne, Sons & Co. of Phænixville, Pa., for an iron cupols, 6 feet in diameter and 40 feet high, for their stove foundry.

In showing the oven burner in gas ranges E. K. Conant, 9 West Fourteenth street, New York, uses a mirror, which is laid under the burner, so that a purchaser, without stooping, can readily see the flame and action of the burner. The Dangler ranges, which he sells, have proven very popular goods this year. Mr. Conant is now on a visit to the factory getting points on the goods he will handle for the fall trade.

WALTERS PERFECT COMBUSTION FURNACE COMPANY is the name of a new concern incorporated at Chicago, with a capital stock of \$200,000; the incorporators are William Walters, James P. Moulton, George W. Mahoney.

PAGE BROTHERS & Co. of Boston, Mass., are distributing an illustrated circular of the Ladies' Delight oil ranges and heaters, which they manufacture in several varieties. The goods are strong and durable, and are litted with burners constructed on the "central draft" principle, thus giving a great amount of heat without its being transmitted to the oil. The burner tubes, reservoir, &c., are of brass, and the construction throughout is of a substantial character.

THE PENINSULAR STOVE COMPANY of Detroit have recently distributed to their customers a new furnace catalogue and reference book bearing upon the subject of hot water and warm air heating. It is of a size to be readily carried in the pocket, and sets forth in concise form the merits claimed for the Peninsular hot water heaters and warm air furnaces. Half of the pamphlet is given up to 1'sts of names of some of those who are using the company's goods, and one page is devoted to the form of contract in use by the manufacturers.

THE ART STOVE COMPANY OF Detroit, Mich., are now running their works with a full force and 60 hours a week. They report a good demand for their oil stoves, referring especially to their large 15-inch wick oil heater, with combination flues and hot air ducts. On this form of stove, which is the same the company were using last year, they have been granted a patent covering some improvements. They have also taken out two patents on the new oil heaters which have been introduced for this year's trade. One is a circular improved 15-inch wick stove embodying original features, the other being a small stove which has already been placed on the market. It is built in a substantial manner and has all east iron parts in place of stamped brass.

S. B. SEXTON & SON of Baltimore, Md., have recently brought out a new low down radiating furnace, made in four sizes portable form and three sizes for brick setting. These heaters are especially adapted for use in low cellars and in places where it is desired to give a heavy incline to the pipes leading from it to the registers in the floors above. The radiators, which constitute a new feature, are so arranged as to allow a sufficient space between them and the fire pot for the passage of cold air. This is especially true of the lower radiator, the bottom of which being placed about on a level with the grate bed acts as a trench plate and equally distributes the cold air, which passing around and over this large heated surface warms it to the proper degree and discharges it into the living The dome over the fire is of rooms. cast iron, the cylinder, side and back radiating tube are of rolled steel, the feed door is lined with an inside per-forated plate, and the grate is of the prismatic pattern.

"FIRE FANCIES" is a beautiful book just issued by the Michigan Stove Company. It appeals to the artistic, the poetic, the literary and the romantic faculties. There are 20 pages of it, including the cover, and we venture to say that no one who picks it up will lay it aside until he has read almost every word of it. The work consists of a collection of quotations on the subject of fire from the writings of famous authors and choice poetical selections on fire and the fireside from the effu-sions of world renowned writers. These are illustrated and printed in quaint text or lithographed and illuminated in colors with much art. The selections have been made with great care and the exercise of a highly cultivated taste. The Garland trade mark is effectively introduced as a decorative feature and a few scattering pages are devoted to representations of the 1894 Art Garland base burner, the Art Garland new series, the Art Garland modeled series, the Peerless Garland surface burner and the Ideal Garland revertible flue and direct draft heating stove. Engravings are also presented of notable features of the company's World's Fair exhibit, as, for instance, the first anthracite self feeding stove made in America, the Mammoth Garland, which overshad-owed all other stoves and formed the company's pavilion, and the oldest cooking stove in America. The book is bound in enameled white paper, with a gorgeously illuminated back. It is mailed in a scarlet envelope.

BURDETT, SMITH & Co. bave discontinued shipments from their warehouse at Sixteenth and Johnson streets, Chicago, and now make direct shipments to their customers from the foundry, at Troy, N. Y. Edward A. Burdett, vice-president and Western manager, who has been in charge of the company's Western interests for a number of years,

has transferred his official duties to the home office. The company's business in Chicago is now in the care of Albert U. Peterson, whose headquarters will be maintained at their warehouse until some disposition is made of it. The building is specially adapted to the stove business, is admirably located for handling railroad or city trade and would fully meet the requirements of a stove manufacturer desirious of establishing a Chicago branch.

THE SUPERIOR FURNACE COMPANY of Little Falls, N. Y., have extensively circulated among the trade of the New England States an announcement calling attention to the agency they have recently established in Boston. It is located at 28 Union street, and is in charge of Henry A. Kelley, well known to the trade throughout the New England States. This agency has been cstablished to provide for the Eastern demand for Superior furnaces, heaters and ranges, and in order to enable the local dealer to see for himself and investigate the relative merits of the company's line of heating and cooking apparatus. Mr. Kelley will answer all inquiries, prepare plans and specifications and eall upon the trade at stated intervals with a view to more carefully presenting the merits of the goods which he represents.

THE CHICAGO & ERIE STOVE COM-PANY of Erie, Pa., have nearly completed the patterns for 15 styles and sizes of new gas heaters, which, added to their already extensive assortment, give them a line which cannot fail to command the attention of the trade.

THE GEM CITY STOVE COMPANY of Dayton, Ohio, are distributing blotters advertising their Clermont, Success and Perfect cooking stoves and ranges. One side of the blotter bears a finely line graphed representation of the Clermont cook, together with the company's business card.

The Thos. White Stove Company, Quincy, lll, are at work on an addition to their plant, which will shortly be completed. The ad tition is in the shape of a five-story brick building, built so as to conform with the building which it adjoins, and will be used for storage and mounting. This concern are having excellent success with their White's oak stove, which is made in four sizes for coal or wood. The base and bottom are cast in one solid piece, and it is claimed to be a perfect fuel keeper and easily controlled. The trade are invited to order a sample stove, and as every one is guaranteed, the fact is emphas'zed by the manufacturers that there is no risk attached to ordering this stove.

THE CHANNON-EMERY STOVE COMPANY. Quincy, Ill., have recently completed additions to their plant which will enable them to largely increase their output. The improvements consist of a new boiler and engine house, 30 x 40 feet, substantially built of brick, in which they have placed a new 100 horse-power boiler and 80 horse-power engine. They have also added a new four-story brick building, 50 x 80 feet, which will be used to increase their cleaning, mounting and trimming department, and a portion will also be used as a warehouse. A new nickeling plant has also been included, so that they are now in position to meet the requirements of a steadily increasing trade. Their stock of stoves is very complete, and they are in a position to ship very promptly.

M. HERTENSTEIN & Co of Columbus, Ohio, issue an illustrated circular call ing attention to their line of Royal ranges and cook stoves. The kinds shown are Art Royal ranges, Gem Royal cooks, Grand Royal ranges and New Royal cooks. The Art Royal ranges are adapted to coal and wood or strictly to wood, and are furnished in three The Gem Royal sizes and 48 styles. cooks are intended for coal and wood and are made in three sizes. The Grand Royal ranges are for wood only and are made in three sizes. The New Royal cooks are exclusively for wood and are also made in three siz.s. Another circular calls attention to the Gilt Edge oak stove, which is turnished in four aizes and is stated to be mounted with highest grade sheet steel, with every joint air and gas tight. The illustrajoint air and gas tight. The illustra-tions show all these goods to be of attractive appearance.

THE BENNETT & PECK HEATING AND VENTILATING COMPANY, Cincinnati, were granted an amendment to their charter changing the name to the Peck-Williamson Heating & Ventilating Company.

BUCHSCHATZ & BRENDLE, 529 West street, make a specialty of fire place brass goods, frames, fenders, andirona and ornaments. Various designs of fire place borders are made to suit special requirements.

PASSERS by the show windows of Edwin A. Jackson & Bro., 50 Beekman street, New York, are apt to stop, attracted by a handsome example of cast iron work which is displayed therein. The object is composed of three plates, designed for the back and side linings of an open fire place. They represent, of an open fire place. They represent, in relief, a Roman chariot with three horses, which, together with the charioteer, are executed with great spirit and artistic skill. The windows also contain some attractive specimens of the firm's art work in the form of wrought iron and brass andirons, fenders, lamps, &c. The interior of Messrs. Jackson's store presents an equally pleasing appearance. Rows of their ventilating grates, with mantels and variegated tile settings, are displayed on either hand, while fire place fixtures of all kinds occupy the center of the floor. All are arranged with a view to the artistic effect, which is assuredly obtained. The firm report a large and growing demand for their patent Jackson ventilating grates, which, they say, are now in use from Orilla, Ontario, to Los Angeles, Cal., and from Victoria, B. C., to St. Augustine, Fla.

It is the opinion of above manufacturers that traveling salesmen will work harder to earn their salaries this season than for some years past. Dealers generally are placing small orders and traveling salesmen will be obliged to make several trips over their territory so as to pick up all the business they should get. The manager of a large Chicago house says that he expects to keep his men on the road up to January 1 nnless the character of the trade materially changes in the meantime.

MANAGER HANRAHAN of the Chicago branch of the Peninsular Stove Company reports an improvement in the condition of trade which is highly gratifying. Several carload orders have been shipped this month, while small orders are more numerous. While the volume of business is below what it should be at this time, he has hopes that as the fall season advances a much better buying movement will develop. The Peninsular Stove Company have pre-

pared this year for the use of their agents a much larger line of advertising devices than ever before. comprise hangers, posters, picture cards, &c. Two very tine embossed cards, &c. pictorial cards have been issued, which are of a high order of excellence and are expected to attract much attention. The small picture cards comprise 39 styles, many of them having spaces in which the local agents can print their names and addresses. They are also distributing two kinds of memorandum books, one of which is bound in cloth and lettered in gold. A unique advertisement is a box of fine cut chewing tobacco. The box is handsomely lithegraphed, and the contents will be appreciated by many a lover of the weed, being the choicest product of the Banner Tobaceo Company of Detroit.

THE LEIBRANDT & McDowell STOVE COMPANY of Philadelphia are putting on the market the Arcadian, a six-hole range, in four sizes, with front ash pit and right hand oven door, a hardsome range of the higher grade. The Common Sense grate, recently patented, is used in this range, and appears for the first time. In heating goods they are introducing the Strat-ford open grate, having a blower which is easily and quickly adjusted to any point of opening without removal from the grate, and adapted to heat an upper room; the Tycoon square double heater with open front, and the Tycoon fire place heater, both made in three sizes and to meet the demand for low priced goods; and the Stratford square double heater, an open front stove with cold air supply at bottom, and having the new adjustable blower. The latter stove is not a self feeder. The company are getting out a new catalogue and expect to have it in shape for distribution toward the end of next

THE DE HAVEN STOVE WORKS, Al legheny, Pa., which have been idle for six weeks, will resume operation on Monday with 300 hands.

"THE JACKSON VENTILATING GRATE," is the title of a 16-page cat VENTILATING alogue in a buff cover, issued by Edwin A. Jackson & Bro., 50 Beckman street, New York. The first pages are de voted to letters from users giving an account of their experience on the practical points that are usually subject of inquiry by purchasers. These are followed by a full description of the grates, their style and finish, with dimensions and directions for ordering and setting. Cuts showing the grate are freely used, so that a design suitable to where it is to be used may be selected. A variety of sectional views show the manner in which the grates are set with an ash pan and with ash pit with cold air duct, to heat an upper room, and also views to aid a mason in doing the brick work. Borders, spark guards and mantel protectors are also Some space is devoted to ex tolling the merits of grates as heating and ventilating apparatus.

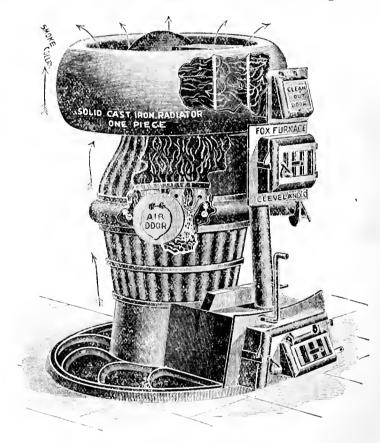

The whaleback steamer "Sagamore," which arrived at New York last week from Tampico, is remarkable on account of her economy in coal consumption. She attains a speed of 12 knots an hour on an expenditure of 16 tons of coal in 24 hours. The "Sagamore" was built at Sunderland, England, according to McDougali's plan, and has hitherto been employed in the Mcditerranean coal trade.

The Fox Sofi Coal Furnace.

In the accompanying engraving we present a view of the Fox east iron furnace, with smoke consuming attachment for soft coal, the outside casing being removed and portions of the radiator and fire box broken away. This heater is made of heavy eastings, the parts subjected to the greatest strain being corrugated. One of the particular features to which attention is in vited is the practical absence of joints. With the exception of the feed and clean out door openings the manufacturers state that there is only one joint above the gas ring. It is a deep cut joint, so that the cement with which it is packed is held tightly in place. Another interesting feature in connection with this heater is the smoke corsumer. The makers state that by means of a gas the air to be warmed is forced to travel between the two radiators and is carried almost over the center of the fire pot, which is the hottest portion of the fire. Three sizes of the Fox heater are made, in all of which special care has been taken to have every part of proper weight, with due allowance at all times for expansion and contraction.

South Dakota last week broke the season's record for warmth, 110° in the shade having been recorded at several points in the State. The intense heat is reported to have seriously injured the growing crops in the Dakotas.

An unusual number of New York City corporations are lodging protests in the Supreme Court against the as

The Fex Soft Coal Furnace.

ring, which is placed between the upper section of the fire pot and the radiator of the furnace, an air chamber is formed, leading to the outside of the furnace casing. Through this connection a cur-rent of air is taken and passed over the heated surface of the furnace, raising the air to a high temperature, after which it is introduced through openings shown in the fire pot into and above the fuel while in process of combustion, "affording a supply of heated oxygen, which, combining with the gases of the coal, cokes the coal and consumes the gases of which the smoke and smudge consist." The products of combustion are carried through the inner radiator to the outer one, which is a large cast iron tlue made in one piece and entirely encircles the inner radiator. After entering the outer radiator the products of combustion divide and travel around both sides of it before escaping to the smoke flue. The inner radiator ioclines inward from the fire pot, and between the two radiators is a large air space. Owing to the form of the outer radiator a large portion of

sessments on their property made by the Commissioners of Taxes for the present fiscal year. They include banks, trust companies, insurance, railroad and manufacturing companies and other large corporations.

The necessary appropriations having been secured, work has been resumed on the new ships at the Brooklyn Navy Yard. The completion of the cruiser "Cincinnati," and the alterations in the gunboats "Castine" and "Machias" are being pushed rapidly forward. The latter vessels will not, however, be ready for sea much before the middle of September.

It is reported that several members of a special committee appointed by the French Government to test the merits of a new explosive, discovered by M. Turpiu, a French inventor, have asserted that the wonderful claims put forth for it cannot be substantiated, and that, in fact, the explosive is in no way equal to ordinary smokeless powder.

# TRADE REPORT.

## The Iron Market.

The Iron trade continues exceedingly dull throughout the whole country. The demand is still very slow so far as Finished Iron and Steel is concerned, and that causes indifference to the scarcity in some sections of Pig Iron and Soft Steel.

The dominant factor at the present time is the continued delay in the resumption of full work in the Connells ville region; in fact, it has been frequently hinted that the leading Coke interest is in no hurry to supply the market. As it is, Pittsburgh is getting a steady supply, while the valleys and Wheeling have either no Coke at all or are getting very little. The result is that Bessemer Pig and Soft Steel continue scarce, and that the prompt decline expected by so many is not in aight for this month or for August.

The Chicago district has been able to take advantage of this situation and has been reaching further East for Soft Steel than it has done for a long time

past.

Pig Iron.—The light demand in the New York market seems to make impossible an advance which would otherwise follow the heavy restriction of the output. We quote standard brands \$12.50 @ \$13 for No. 1; \$11 @ \$12 for No. 2, at tidewater. Southern Iron, same delivery, \$11.50 @ \$12.25 for No. 1; \$10.50 @ \$11 for No. 2; \$10 @ \$10.25 for No. 3; \$10.25 @ \$10.75 for No. 2 Soft, and \$10.50 @ \$11 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9.75 @ \$10.25.

Philadelphia advices indicate an inactive market for Pig Iron in that district, but prices are very steady, and in spots are a trifle higher. The decrease in stocks shows that consumption is pretty well up to production, allowing for the increase during last month, and the probability of a similar increase during the current month. Since May 1 stocks appear to have decreased 330,000 tons, and although that was no doubt largely due to the shortage of fuel, it indicates that over 100.000 tons per week will be required to maintain the statu quo. Prices are steady to firm, with the general range of quotations as follows for Philadelphia or equivalent points:

 Standard No. 1 Foundry X
 812.50 @ \$13.00

 Standard No. 2 Foundry X
 11.50 @ 12.00

 No. 2 Plain
 10.75 @ 11.00

 No. 1 Soft
 11.50 @ 11.75

 No. 2 Soft
 10.75 @ 11.00

Very little new business was entered by any of the Chicago Iron houses here during the past week, but some large orders are still in sight, which are expected by the local furnace companies, that have been postponed for various reasons. For the present matters are extremely quiet. Shipments are still interfered with as a result of the strike, and it will require a week or more to get everything into proper condition. The dullness extends to all classes of Iron, including Southern Coke and Lake Superior Charcoal. Quotations are given as follows for cash:

Lake Superior Charcoat..... \$14.50 @ \$15.50 Local Coke Foundry, No. 1... 10.75 @ 11.00 Local Coke Foundry, No. 2... 10.00 @ 10.50

Local Coke Foundry, No. S	9 59 <b>%</b>	10,00
Local Scotch	16.75 %	-11.00
Ohio Strong Softeners No. 1	$13.00  \odot$	13,50
Southern Silvery, No. 1	@	
Southern Silvery, No. 2	®	1.11.
Southern Coke, No. 2	a	10.75
Southern Coke, No. 3	@	10,50
Southern, No. 1, Soft	@	10.75
Southern, No. 2, Soft	®	10.50
Tennessee Charcoai, No. 1	@	
Tennessee Charcoal, No. 2	@	54445
Alabama Car Wheel	17.50 @	18.00
Jackson County Silvery	15.00 @	18,00

There is very little demand in the Pittsburgh market for Foundry Iron for spot delivery, but the supply is very light and prices firm at \$11.75 @ \$12 for No. 1 and \$10.75 @ \$11 for No. 2.

In the Cincinnati market business in Pig Iron has been much restricted by the railroad troubles during the week, but the offerings of Southern Iron were not large and sellers were indifferent about selling unless at pretty full previous prices. The principal sales during the week have been in a jobbing way only. Quotations are as follows:

In St. Louis the local demand for Pig Iron is restricted almost entirely to carload lots. An occasional order for a 100-ton lot is received, but it is the exception rather than the rule. The stocks on the furnace banks are not large, and a slight improvement in the demand would quickly clear up all the Iron now in sight. Prices are well maintained, and while, as above stated, stocks are not heavy, consumers have no difficulty in securing what Iron they need. We quote as follows for cash, f.o.b. cars St. Louis:

 Southern Coke, No. 1 Foundry
 \$11.00 @ \$11.25

 Southern Coke, No. 2 Foundry
 10.00 @ 10.25

 Southern Coke, No. 3 Foundry
 9.75 @ 10.00

Quotations for Pig Iron range higher ru the Birmingham, Ala., district; furnaces are asking from  $50\phi$  to \$1 above market for future small deliveries, though as yet without success. It must, however, take but a slight impulse to start an upward movement. As a matter of fact quotations are now  $75\phi$  @ \$1 above what they were early this year. No. 2 Foundry and No. 1 Soft are quoted at \$7.50; No. 3 Foundry, \$7; No. 2 Soft, \$7.25.

#### Metal Market.

Pig Tln.—Buying has been commonplace in the extreme. Neither jobbers nor consumers have appeared inclined to make purchases beyond their immediate needs. The market has weakened in consequence, particularly as the statistical position of the metal is not at all encouraging. Shipments from the Straits during the first half of the month amounted to 2150 tons. This included 1000 tons to

Great Britain, 800 tons to the United States and 350 tons to the Continent. During the corresponding period last year 1525 tons were sent out from the Straits. There has been received since the first of the month about 1000 tons, and it is clear that the stock in first hands has accumulated to greater or less extent. This and the liberal amount of stock siloat from producing points, along with uncertainty as to what England may ship to this quarter, gives the market anything but a strong appearance. There are now at least 20,000 tons in sight for Europe and America; in other words, the equivalent of four months' consumptive wants on a liberal estimate. There is only a very narrow speculative interest in the market here. Jobbers' prices for small lots are unchanged at last week's quotations.

Copper.—Only routine trades of comparatively small dimensions have been made here of late, and the demand is extremely tame. Deliveries on old orders are taking care of the greater part of the supply that comes forward, however, and affairs are thereby so adjusted that prices remain very steady. For small lots of Lake Ingot from stock dealers ask 10½¢ % lb.

Sheet Copper.—Inquiries and orders are equally small and searce. Prices are well maintained according to the list on a 15%  $\tilde{\tau}^2$  lb, net, basis for moderate retail quantities.

Pig Lead.—Sales have been moderate, and now that transportation facilities are better, the tendency is to seek business at prices somewhat below recent popular quotations. Forward contracts are offered in the market at rates unusually favorable to the buyer, presumably upon the presumption that there will be an abundance of Lead during the autumn months. Dealers' retail prices for small lots range in the neighborhood of  $3\frac{\pi}{3}$  @  $4\phi$  per fb.

Spelter.—The market is in a very flat condition and prices for ordinary Western have not varied much. Offerings have been freer, and it has seemed easier to buy at the lowest figures lately quoted. Still jobbers hold, for small parcels, to about  $4\frac{1}{4}\phi$ .

Fin Plates -Except for a fair run of small orders for spot goods early in the week, the market for Tin Plates has continued very quiet. Consumers are not buying beyond their immediate requirements. Merely a routine trade has been done, chiefly at the prices that have ruled for some time past. Operations in futures have been slow, and buying interest is decidely tamer than is usual at this season of the year. Canners' requirements are being mainly filled from contracts placed earlier in the year; but even these have been curtailed in some cases, and the goods ordered have been placed in bond by the purchaser on their arrival. It is calcupurchaser on their arrival. It is calculated that the canners' packs will be at most three-quarters under the average this year. The peach, pea and small fruit crops are poor, and corn is not likely to be abundant in this vicinity. Tomatoes alone give a really good

promise. Rhoting Plates are in fair demand, particularly the native product. Prices are without radical change, but inclined to softness. Tariff uncertainties continue to demoralize the market.

Sheef Iron.-Inquiries are good and mills are fairly well supplied with orders for both Black and Galvanized Sheets, but business has not shown any extraordinary activity. Jobbers, indeed, characterize it as deadly dull, but mill agents report a good average demand and look for a better in the early fall.

Mills making Black Sheets for tinning are in especially good condition, having all the orders they can fill. The entire Black Sheet capacity is believed to have gone into operation this week, so that the temporary scarcity, which has been severely felt by the Tin Plate makers, will soon pass over. It is believed that American Black Sheet mills are now nearly able to take care of the wants of all the present American Tin Plate manufacturers. Prices are firm for both Black and Galvanized Sheets. For small parcels of the latter a discount of 75 % @ 75 and 5 % off is the ruling rate.

## Chicago Report.

#### CONDITION OF THE

# Hardware Trade.

INCE the railroads stopped by the disturbances connected with the strike resumed operations, there has been a renewal of business in the centers directly affected, referred to in the following dispatches from Chicago and St. Louis as well other advices. The movement of general trade is not. The movement of general trade is not, however, at all active, and for the time being business is almost at a standstill. Most of the orders which are being received are from smaller houses who are sorting up or purchasing goods required for their immediate needs. The large trade are also to some extent placing orders, and it is reported that one or two of the leading jobbing houses are buying much more liberally than for some much more liberally than for some time, apparently regarding the present as a good time to purchase and get the benefit of the very low prices which on many lines are obtainable. The cases in which this policy is pursued are, however, comparatively few and quite exceptional, most houses purchasing cautiously and entertaining no especially sanguine expectations as to the volume of trade in the near futbe it is impossible to forecast with certainty, but in present conditions it is incumbent on buyers to watch the market closely and discover if they can market closely and discover if they can the earliest symptoms of recovery in the matter of prices or increase in the volume of business. It is certain that stocks in the hands of the trade and of manufacturers are exceptionally light, and if a normal demand should set in the market would probably in many lines promptly respond, developing possibly something of a scarcity and an enhancement of values.

Advices from Chicago.—A much larger trade has been enjoyed during the last few days by the jobbers in Shelf Hardware. Orders which have been kept back by the demoralized condition of the railroads are now coming in rapidly, and the concentrated business of the past two weeks is being felt. The Northwestern trade also now fully understand that Chicago is able to make prompt shipments. Mail orders are good as well as orders sent in by traveling salesmen. The Stove Board manufacturers are now quoting prices for the coming season, which are from 20 to 40 per cent. of an advance over those made last year. The Heavy Hardware trade is confined to small orders, which are tairly numerous. People are buying cautiously, and only from hand to mouth, but they seem to be obliged to buy often, and consumption is thus shown to be good, despite the appearance of extreme dullness. The Carriage trade is now about over for this season.

#### Notes on Prices.

Wire Nails.—The mills are nearly all shut down and report exceptionally light stocks, which are, however, amply sufficient for the very moderate demands which are made upon them. It is not unlikely that in many cases the mills will remain closed until some time in August, as the manufacturers are not disposed to accumulate heavy stocks until there are indications of a more satisfactory business. Quotations continue \$1.15 for carload lots at mill, a price which is quite well maintained, though sometimes shaded by jobbers. Small lots from store in New York are held at \$1.30 to \$1.35.

Advices from Chicago.—Manufacturers are booking almost no orders. Factories are shut down and stocks are light,

so that prices are firmly maintained. The small business is progress is being handled almost exclusively by jobbers, who are slightly shading manufacturers' prices on carload lots. Quotations are \$1.20 to \$1.25, Chicago, on factory lots, and \$1.25 for small lots from stock.

Cut Nails.—Cut Nails are held at about the same prices that have prevailed for the past week or two, the market in the East being represented by the quotation of \$1 for carload lots on dock at New York, a figure which is, however, slightly shaded in some cases, while, on the other hand, some mills ask a slightly higher price. Most of the mills are shut down, as usual at this season, and report light stocks. The store price for Cut Nails in New York is \$1.10 to \$1.15.

Advices from Chicago.—The Lakeside Works are expected to start up in a few days, or as soon as a regular supply of fuel can be depended upon. Wages have been adjusted for the coming year, and orders have accumulated in sufficient quantities to assure a steady run for some time. Quotations on factory lots are maintained at 95 cents, Chicago, on 55-cent average and \$1.15 on small lots from store.

Barb Wire.—The Barb Wire market is exceedingly sluggish and there is scarcely enough business to make a price. Quotations are therefore unchanged and the market is represented by the following prices for Four-Point Galvanized, delivered at the points named: Pittsburgh, \$2 05 to \$2.10; Clevelaud, \$2 10 to \$2.15; Cincinnatior Allentown, \$2 25 to \$2.30; Chicago or New York, \$2.25 to \$2.30. It is not unlikely that some concessions could be obtained from these figures, but manufacturers are not pushing for business.

Advices from Chicago.—Manufacturers of Barbed Wire seem to be letting the market take care of itself. The demand at present is very light from all classes of buyers, but quotations continue at \$2.35 to \$2 40 for small lots of Galvanized from store, with the usual reduction of 10 cents on carload lots. The Washburn & Moen Mfg. Company have started up their works and are now running full in nearly every department.

Screws.—The market for Screws continues to be somewhat weak and trregular and somewhat lower prices are being made more frequently than a few weeks ago.

Cordage.—Manufacturers are holding prices firmly on the basis of 74 cents for Manila in large lots, f.o.b. factory or New York. The demand, however, is very moderate and some of the jobbers who still have considerable Rope on hand are cutting this price more or less freely.

Portable Stoop Seat.—Magic Introduction Company, 321 Broadway, New York, are offering this article. The Seat is sold to the trade at \$5 per dozen net.

Magic Self Lighting Lamp Burner.

—This article is put on the market by
the Magic Introduction Company, 321
Broadway, New York. The Burner is
sold to the trade at \$5 per dozen net.

Acme Gas Cuke Griddle.—Stuart & Peterson Company, Burlington, N. J., are effering this article, which was described in our last issue. The Griddles are sold to the trade from the following list, which is aubject to a discount of 10 per ceut.:

Price. holding three griddles, capacity .\$17.00

Wringers .- The American Wringer Company, 99 Chambers street, New York, have issued revised prices on their line of Wringers. Advances are made in their standard first quality Wringers, auch advances being re ferred to by the company as covering but a portion of the increased cost of the goods on account of the superior quality of the rolls used in them. This is a matter to which the company have recently been and still are giving special attention, and for the manufacture of rolls the company have erected an exceptionally complete plant, which is now in operation. Terms are 60 days, or 2 per cent. discount for cash in 10 dava :

Reynolds & Co. - Reynolds & Co., New Haven, Conn., issue the following discount sheet, representing their present prices, which apply only to standard goods in full packages, terms cash in 30 days:

Horse Nalls .- At a recent meeting of the manufacturers of Horse Nails it was decided to maintain present prices on all grades, and as a result the market is referred to as somewhat more regular and on the whole in a better condition than for some time.

Glass.-The market in American Window Glass continues without important change, although the demand has perhaps alightly improved owing to the fact that the railroads in the West are again in pretty fair shape for the reception of business. Whatever buying is done is for immediate con sumption and consists for the most part of small lots, an entire absence of speculative demand being noticeable. Owing to the competition of the jobbers who have on hand atocks of Glass purchased at low prices manufactur-era have been compelled to slightly shade their previous quotations, the quotation on Pittsburgh Glass being now 80 and 20 per cent. Plate Glasa is in a very satisfactory condition and the outlook for the future is regarded as very promising. Quota-

tions for New York and New Englandon the Eastern list, are 70 per cent. dis count for sizes 5 feet and over, and 70 and 10 per cent, discount for sizes 5 feet and under. For the West quotations are reported as 70 and 5 per cent. discount for sizes over 10 feet, and 60 and 20 per cent. discount on sizes 10 feet and less, Western manufacturers'

Old Metals.-The market continues quiet, but prices remain steady. Some descriptions of Scrap Iron are in med erately good demand. and command a tritle of advance over last week's quotations. The following quotations represent current prices paid by New York dealers:

Heavy Copper. # 15 Light and Tinned Copper # 15 Heavy Brass # 15 Light Brass # 15	5 ¢

#### Trade Notes.

THE SCRANTON CHIMNEY CAP COM-PANY are a new manufacturing concern recently organized at Seranton, Pa. Charles McMullen, G. R. Clark, W. C. Carey, M. W. Finn and W. J. Renniman are the incorporators.

THE BUDKE MFG. COMPANY, 421 Wood street, Pittsburgh, Pa., are sending circulars to the trade relative to their Acme Nesting Stove Pipe, to the advantages of which they refer. They also call attention to their Drip Pans and four-pieced Elbows.

THE PLANT of the Canonsburg Iron & Steel Company, Canonsburg, Pa., manufacturers of fine sheet iron and sheet steel, was closed down on Saturday, June 30, for stock taking and repairs. It is expected the entire plant

will resume operations about August 1 rext, and the new tin mill recently erected by the firm will be put in operation at the same time.

I. P. FRINK, 551 Pearl street, New York, is in receipt of a very flattering testimonial letter from the secretary of the Board of Trustees of the First Presbyterian Church, at Asbury Park, N. It relates to the contract given for lighting their church, and, while it is mentioned that the price paid was higher than the figures for which the work would have been done by other concerns, the trustees were fully satisfied on account of the excellent results

WE ARE INDEBTED to Francis I. Maule, 328 Chestnut street, Philadelphia, for samples of advertising blotters, which are gotten up in the unique style characteristic of Mr. Maule's work.

#### Getting to Work Again.

Factories of every kind are resuming operations all over the country. Operations had in numerous instances been suspended for lack of fuel after the coal strike became general. Other concerns closed until wages were settled for the coming 12 months. Very many shut down on account of the railroad strike, which cut off their receipts of materials as well as prevented shipments of products. In other cases it was necessary to take some time for repairs usually done at this season of the year. It is gratifying to note that the resumption of work is quite general. Among those which have started up are not a few whose owners but a short time since were in doubt as to whether they would not find it impracticable to reopen their doors until well into the fall. That they have come to a different conclusion is evidently due to the fact that the demand for their goods is improving and prospects for business are therefore brighter. The Western banks report a better demand for money from their country clients, which they are pleased to see. The currents of trade are beginning to flow again and the movement thus begun may reasonably be expected to gather strength until the producers of raw products are also affected. As long as so many furnaces are out of blast and steel works are idle or running light, the business of the country is seen to be not in a healthy condition. But they may be expected to gradually fall in line from this time forward. The worst is over and the country is far from being ruined.

#### A Time to Push.

One cannot help feeling a high degree of admiration when he chances to meet a manufacturer or merchant able to overcome the depressing influences of the times. There are men who have shown themselves capable of building up and extending their business in the

teeth of the hard times and in spite of | tive humidity of about 75 per cent. the diminished consumption of goods. In some way they have managed to secure a piece of the touchstone of success and they pursue their way without regard to discouraging conditions, managing in some fashion to transmute them to something of benefit. A case in point, which recently fell under the observation of the writer, is that of a manufacturer of articles of a quasi staple character who spent a very short time mourning over the dullness of trade last year. Realizing that something had to be done if he proposed to continue in business, he studied thoroughly the equipment of his factory to see how it could be improved and his cost of production cheapened. Investigation disclosed the desirability of some special machinery for certain work and the installation of better machines in other departments to make the labor done there more effective. Orders were sought on a new basis and a fresh start was taken. From that time a steady gain was made from month to month in the volume of business handled. Further than that, the impetus thus acquired was due to such a plain cause that the manufacturer has profited by the lesson learned and is now on the alert to see what new machine or new method he can introduce to keep up the speed. For him 1894 may be remembered as a year of very hard work, but not as a time of business stagnation and wasting capital.

#### Humidity.

The exact relation existing between humidity of the atmosphere and our personal comfort while we are surrounded by it is still an open question. There is not even unanimity of opinion as to whether our comfort is to be measured solely by the relative or by the absolute humidity-that is, by the amount of moisture in the air relatively to its total capacity for absorption or by the total amount present irrespective of the absorbing power. Certain it is, however, that the humidity, no matter how measured, has much to do not only with our comfort, but may even determine whether life itself shall continue if the person be exposed for a great length of time to given atmospheric conditions. It is certain that the com plete removal of all moisture from our atmosphere would eventually result in the extinction of the human race, while almost parodoxically it is true that there is marked immunity from disease in excessively dry climates. We generally look upon the average summer day in the Northern portion of this country as best meeting the atmospheric conditions necessary to our comfortable existence. That is, a temperature of about 70° and a relaalthough a slight increase in the moisture of the air will have no sensible

Loss of Animal Heat.

When we speak of cooling ourselves we really imply that we place ourselves in such relation to cooler objects as to permit of the more rapid dissipation of heat from our bodies. For, by the physical and chemical processes going on within us, whereby there is actual combustion of the carbon of the blood, heat is generated, which must by some means be allowed to escape from the body. Three means for this dispersion are provided: 1. Radiation to the air and surrounding objects. 2. Conduction, principally to the air in immediate contact with the body. 3. Evaporation of moisture from the lungs, throat and skin. It is one of the wonders of nature that there always exists such proportion of action between these three agencies that a healthy body remains at an internal temperature of just about 98° F. irrespective of climatic conditions. Radiation and conduction are practically constant in their relative efficiency at any stated temperature and condition, while the evaporation varies widely with the humidity of the atmosphere. In comparatively dry air equality of temperature is kept up by a steady but imperceptible evaporation from the skin. In moist air this rapid evaporation is retarded and the water deposited as perspiration, the air being too heavily laden to take it up. Air in motion increases both conduction and evaporation by the constant bringing of fresh air to take the place of that already moistened or heated. High humidity has the effect of modifying very materially the temperature at which comfort may be secured. Thus the moist climate of the British Isles, particularly in the South and West, renders a temperature of 56° to 60° nearly the equivalent of 75° to 80° in the dry Northwest of the United States-that is, so far as the senses are able to detect it in the matter of personal comfort.

#### Cost of Humidifying.

All this goes to show the desirability of properly moistening the air within our dwellings and thereby producing an artificial atmosphere approaching as nearly as possible to that of an average summer day. It appears such a simple matter to secure the proper degree of humidity by the use of water pans, sprays and the like, that the actual cost of the operation seldom receives its share of attention. In this process it is, of course, necessary not only to evaporate the water into steam

of low tension, but also to heat this water, steam or vapor to the final temperature of the air in which it remains absorbed. As is well known, the absorbing capacity of air increases very rapidly with its temperature. This is not evidenced by the relative, but only by the absolute humidity. Thus at 0 a cubic foot of saturated air can coutain only 0,000079 pound of water, while at a temperature of 72 this would be increased to 0,001221, and at 112 to 0,003946. So, of course, the moisture that exists in t cubic foot of saturated air at zero will be practically imperceptible where the same volume of air has been raised to 72 without further acquisition of moisture. It is the heat necessary to the process of humidifying this volume to the proper point that therefore measures the cost of the operation. No comparison cau be more justly made and no figures can better illustrate this fact than those taken from actual observation. Hence the following record of temperature and humidity in the city of Philadelphia: Average temperature for the months of January, February and March, 34; average humidity for same period, 68.8 per cent., equivalent to 1.57 grains of water per cubic foot. For July, August and September the average temperature was 71 and the average humidity 68.3 per cent. If we consider, for the sake of round figures, that 68.3 per cent, be the proper humidity for a temperature of 70°, then a cubic foot of air at that temperature must contain 5.46 grains of vapor of water. By a little calculation it may be shown that in order to heat I cubic foot of the winter air from 34 to 70° would require 0,635 British thermal unit. If at the same time sufficient moisture is added to secure a final relative humidity of 68.3 per cent. at 70°, allowance being made for expansion of air and vapor due to heating, there will be required for the process of moistening alone no less than 0.612 British thermal units, or almost as much as was necessary for the heating of the air. Of course, for the purpose of maiutaining within the room a temperature of 70° the air before admission to it must be heated to a considerably higher temperature, thereby changing the relation and decreasing the apparent proportionate cost of humidifying. But it is certain, however, that there is an absolute disappearance of a large amount of heat in the moistening process that is not actually apparent in the heating of the apartment.

The Manual Training Teachers' Association of America held their first annual convention at the Drexel Institute, Philadelphia, last week. Representatives from all parts of the county were in attendance and a number of valuable papers were read and discussed.

Massachusetts courts have enjoined the Sugar Trust from doing business in that State unless it complies with the law requiring corporations to file annual statements of their financial condition.

## Press Working of Sheet Metals.—X.

BY OBERLIN SMITE.

Special Machines.

In addition to the thousands, if not millions, of members composing the army of presses in active service, an army which is constantly mustering in new recruits for newly invented purposes, to an extent almost inconceivable to the past generation, there are in use a number of modifications and amplifications of the power press proper. These may, in general, be denominated automatic metal pressing machines, and they are of almost every conceivable design and degree of complexity. Many of them are hidden in their own lairs, never coming forth in the light of public gaze. Others again can be seen in metal factories of all sorts-in the do mains of pin making, hook and eye making, button making, &c.

Such machines usually turn out so enormous a product that they themselves are comparatively few in number. Being so few and so highly specialized, it naturally follows that they themselves have not become regular articles of manufacture, but are worked out, one at a time, by a series of experiments. In many cases such a machine is but the perfected descendant of a line of ancestors, each of which has, in the course of its evolution, contributed new facts to the problem whose solution is sought -only to die in its turn and he buried in a scrap heap, giving place to some still further perfected child or grandchild, the final outcome being in some cases so marvelous a something that it seems to outvie human brains and fingers in the perfection and rapidity of its work. Naturally, enormous sums of money have been spent upon develop-ing machinery of this kind, and many wise and skillful mechanicians have been tempted to contract, for a fixed sum of money, to produce a perfected machine which has in the end cost perhaps ten times as much. Such money is generally well spent when the final result has been obtained, but is ill spared by the unlucky originator.

Pertinent to these facts, a piece of advice may be given to all inventors of special machines, which is to allow the owners thereof to furnish all the capital, while the designer furnishes the knowledge and experience. If the latter individual furnishes the money himself, as is too often the case, he will find in the end that he has not only furnished experience but has received a great deal that he did not ex-

pect.

Any mechanical explanation of the machinea referred to is, of course, out of the question, as they are too infinite in variety. It may be said in general in variety. that many of them are modifications of power presses, having not only the normal vertical ram motion, but various other rams, levers, &c., moving in other directions, as horizontally backward and forward, right and left, diagonally, &c. These motions are usually obtained by special cams, which move any given member to place, keeping it there as long as required and returning it home. Perhaps by this mancuver a cutting operation will be performed, leaving the cut blank in a certain posi-tion with a "dwell" for a certain time, while some other member approaches and does something else to it in the way probably of perforating it, bending or forming certain parts of it, &c. haps then some third member will approach and do something eise either in the way of operating upon it further or moving it to some other position. Finally, in most cases, a humble member known as a "knockout" or "pushout" will act as a hall porter and usher it forth from without the portals of the machine.

lu certain special machines, as well as in some ordinary presses, the material used has to be brought to a certain fixed temperature. This has been before treated of to a certain extent, but just here an interesting process occurs to me, which, I believe, has been re-cently patented, although I do not remember by whom. It consists of automatically heating the metal by passing a current of electricity through it as it approaches the critical position where it must be worked. This is in principle analogous to some of the other electrical processes pertaining to welding and forging, which are so rapidly being worked out. I do not know what the development of this electrical pressing may prove to be in future, but it is evidently only one of the heretofore unsupposed uses to which electricity may be applied.

FEEDING MATERIAL.

The subject in general of feeding or supplying the material to presses may well occupy a few of my closing paragraphs. The primitive, and by far the most usual, method of feeding a sheet or bar of metal to a press is by hand, the operator's muscles sometimes being guided and assisted by certain fixed sauges, as heretofore mentioned, although it is often the case that he depends upon his eye or hand alone. In some cases, particularly in heavy punching work, the holes to be punched are marked upon the sheet or bar with white paint, and in other cases the centers of such holes are marked with a center punch. In the latter case the punch terminates in a small conical point, projecting in the line of its axis, which enters the impression previously formed by the center punch. Such feeding is adapted only for slow going work, where there is time to properly adjust it. It requires, moreover, constantly vigilant attention on the part of the operator, and does not always produce very accurate results, especially when the press ram runs continuously, as is often the case. The feeding of tin plate to cutting or combination dles is usually performed by hand. This is naturally the case, as the sheets are of small size and not well adapted for automatic devices, because they would have to be replaced too often.

Automatic feeding is mostly applieable to very long sheets or bars, especially to those which are thin enough to be wound upon a reel. In this case an operator can attend to a number of presses at once, only replacing the rolls of material as they are exhausted. For such work a pair of feed rolls, operating after the same manner as a clothes wringer, is usually employed, or some. times two pairs, working in time with each other, one on each side of the dies. This double arrangement is in order that no unfed places shall occur at the ends of the sheet. The feed rolls mentioned have, of course, an intermittent motion, pushing or pulling the work forward while the dies are out of con-tact and stopping while the work is

being done.

Another popular device is known as a "reel feed." This is often used for thin metals where a number of pieces

are to be cut from the sheet at once, while the scrap remains atrong enough to hold itself together after being perforated. This scrap is wound upon a reel at one side of the machine as the uncut metal is unwound from another reel upon the other side. The spacing of the feed is in this case performed by a finger gauge which automatically enters one or more of the cut perforations. making them do their own gauging. The pulling reel attempts a slight excess of motion, the pull yielding when the fixed distance has been moved through by means of a friction slip arrangement. The supplying reel is, of course, controlled by a brake against too rapidly delivering.

Another form of feed is what may be called step-by-step, where the sheet of metal is intermittently fed by being successively gripped, pushed forward, clamped, held in place, let go of by the gripper and unclamped, the grippers meanwhile being returned to their original position ready to repeat the operation ad libitum. Such a feed is often used for sheets of cardboard in cutting playing cards, either singly or in gangs. It is especially useful for this purpose, where great accuracy is required and where no finger gauge arrangement can be used against the edge of the paper itself, on account of its inherent weakness. The same remarks will sometimes apply to certain thin and fragile metallic work.

Various automatic devices are in use for feeding partly made articles to dies whose functions are the performing of secondary or tertiary operations, &c.
These are sometimes reciprocating, but usually rotary, the most common form being an intermittently revolving wheel which, with its appurtenances, is commonly known as a dial feed. This is much used in redrawing cartridges, as, for instance, where the cups made in the first operation are placed by hand into recesses in a horizontal dial wheel revolving upon a vertical axla, the machine running continuously at a speed consistent with thus placing in the arti-cles by hand. There is plenty of room at the front of this dial, which is several inches in dlameter, for the operator to vary somewhat from an automaton and yet get a cup in every hole. Should one occasionally be missed, it of course does no harm. Each cup is brought in succession under the deepening punch, the dial stopping for a sufficient length of time for it to be pushed down through the die and for the punch to be returned above the upper plane of the dial, which then revolves through another stage of its progress, while the punch goes still further upward and returns part of the way down.

In other cases such work as this is performed by what is known as a "friction dial," whereon a number of pieces of work are stood up together in an irregular group alongside of each other, at the large end or opening of a curved wedge shaped recess, whose walls are stationary and whose bottom is the flat continuously moving horizontal disk or dial. The question as to which of the pieces of work shall get in first is somewhat a matter of chance, as they are simply all hustled forward miscellaneously-on something the same principle world's Fair. The one who happens to be ahead is pushed into the gate first, which gate, in the case of the machine in question, is a definite opening leading to a space above the lower die. When it is pushed downward, suffi-ciently operated upon and left beneath the die, then the next one is, by the same frictional action, pushed into its

Many other curious feeds might be mentioned, but those given above will answer as sufficient samples illustrating the general principles involved.

Referring again to hand feeding, the melancholy fact must be looked in the face that many of the best press operators in this and other lands may be found with mutilated hands, or as past masters of the art, with no hands at all. There seems to be a peculiar fatality in this respect, which perhaps is not so strange after all when we consider the enormous number of operations performed by these faithful men and women and boys and girls, in some cases amounting to 10,000, 20,000 (and with work even over 100,000) per day of ten hours. The worst danger is not I think usually, as might be supposed, with "continuous feeding," but occurs in cases where a power press is stopped each time by an automatic clutch, and started by the operator with the usual foot treadle. The dies and the gauging therein are often so arranged that his hand must pass between the upper and lower die each time, to locate and remove the work. He is apt to get his hands rhythmically with each other, which is all right so long as into the habit of moving his foot and his attention is not attracted pretty girls passing the window, a pack of fire crackers exploding in the street, or, worse, by a failure of the press ram to stop as usual at the top of its stroke.

It is too often the case that when some of these things happen a die descends before the fingers are out of the way, and that one or more of them is crushed or cut off. It has so far seemed to be impossible either to make presses that will not get out of adjustment (usually either through the failure of proper attention or from lack of lubrication), or to prevent operators from becoming The only real remedy is to so design dies, with automatic and other safeguards that it is impossible for any part of an operator's person to enter beween them. It is, for instance, perfectly practicable to make a stripper to inclose a punch entirely at all points of its stroke, to extend so low that no fingers can enter beneath it, and to be so thin at its bottom edge as not to be in the way of feeding. With forming dies, the way of feeding. With forming dies, &c., there is somewhat more difficulty, however.

Such providing of safeguards has been carried out in the form of a thoroughly practical system in certain factories known to the writer, but there seems to be a lamentable lack of interest in the matter by employers generally, as well as by the employees who suffer the most. The fact is that a perfect system of such safeguards is difficult to install, and is apt to be quite expensive. The experience of press and die makers is that their customers are not willing to pay for more than enough tools to actually do the work, the extra appliances required for safety not being absolutely neces-sary. In many cases such devices are difficult to design, as any particular die may perhaps require a new system con-trived especially for it. For gradual improvements in this important field it is to be feared we can only look to the future, as we must also for the expensive safeguards needed to protect our much smashed up railway employees. Public sentiment and its consequentlal legislation will, after a while, do this

Power Required.

The horse-power required to drive a press is usually quite small in com-parison with that absorbed by many other machines of about the same general size. This is because the speeds are comparatively slow and the strokes, which do the hard work, are intermittent. Again, we have in literature few, if any, definite data based upon dynamometrical tests of actual work.

An approximate estimate of the power that a medlumly tight driving belt of a power press can supply may be made by the old rule of multiplying the diameter of the driven pulley (which oftentimes is the fly wheel also) by its width, both in inches and by Its revolutions per minute, dividing the product by 4000, the quotient from which will be the horse power. Such result may be discounted quite freely by guess—say from 25 to 75 per cent. This is to allow for the halcyon moments of waste time, so to speak, between the down strokes of the ram, when the belt is doing almost nothing except, indeed, at certain times to restore the depreciated speed of the heavy fly wheel that is (or ought to be) present in every such machine, in order that a part of the power may be freely stored therein for each critical time of need. The discount referred to will be greater in instances where the main shaft is stopped after each stroke by its clutch-because in such case the ram will be actually at work during a less proportion of its total time than with a continuously running shaft. The observer must judge in each particular case as to how much of the time actual work is being done in overcoming friction or otherwise. Of course much better than all this would be the use of a good recording dynamometer (could a suitable one be obtained), from whose records the power used could be averaged.

The wonderful development of some of the various processes involved in the art which is the subject of this treatlse has before been referred to. It is a well-known fact that our commercial metals are all the time being developed into a more suitable quality and form for being acted upon by dies, and that hundreds of inventors are busily at work contriving new devices for the household, the ship, the farm, the road, and every other department of human activity. Moreover, the tendency is constantly to cheapen and unify various parts of these devices, striking them out in dies from malleable material rather than producing them by the older processes of hand forging and casting. It is impossible to predict how far this line of development may go on in the future, but at present the prospects seem to point toward a more thorough and frequent use of the processes in question

as the years go on.

Unquestionably very many articles of common and necessary use, which serve to add to the pleasure, convenience and consequent happiness of mankind and womankind, too, have been increased in number and improved in quality by the facility with which they can be produced in presses and dies. Truly, if the man is to be commended who can 'make two blades of grass grow where grew one before," how much can be said of those men whose toiling brains and hands are providing the means by which not two only, but 2000 useful and beautiful things can be furnished to the waiting multitude for a price at which but one could be obtained by their fathers and their grandfathers!

THE END

# THE LETTER BOX.

#### Tank for Roof.

From A. A.-I would like to be Informed how to make a wooden water tight tank to be placed on a roof and what material should be used.

Answer.-Wooden roof tanks can be made round, with the lower end alightly larger, thus enabling the iron hoops to be driven on and compress the ataves so water tight joints will be the result. The bottom of tauk can be made of 2-inch pine plank, the edges nicely joined, and the outer edge alightly beveled, so as to fit tightly into corresponding grooves cut near the bottom of the staves. The staves can also be made of 2 inch pine planks of convenient width, the edges being properly beveled so as to make a close joint. Such a tank, when properly constructed and of well seasoned materials, should be water tight.

#### Soldering Fruit Cans.

From P. H., New Madrid, Mo.—Do tinners use acid for soldering fruit cans? Is acid generally used in canning factories for soldering fruit and vegetable cans?

Answer .- By "acid" it is supposed our correspondent refers to the usual soldering fluid composed of muriatic acid and zinc. This fluid is sometimes used by tinners and in factories for soldering cans, but is considered objectionable by many, as it is liable to be used in such a manner as either to discolor the cans or cause them to corrode. Again, if there was any of the acid left in the cans it would be liable to injure delicate fruits and vegetables. If the cans are to be soldered by hand, powdered rosin can be used, and if the soldering is to be done by machinery there are a numher of soldering fluids on the market that are used by canners.

#### Pattern for Flaring Article.

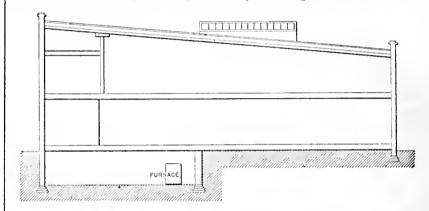

From X. Y. Z.—I would like to know the shortest and most accurate method for obtaining the length of the pattern for flaring work of any size in one piece.

Answer .- In The Metal Worker of November 4, 1893, was published an article descriptive of the method employed in obtaining the pattern for a flaring article, the pattern being in four pleces. It is obvious the same method is to be employed in obtaining the pattern for an article of one piece. Our correspondent is also referred to the solution of the problem as presented on pages 100 and 101 of "The Metal Worker Pattern Book."

#### A Rearranged Heating System.

From Cornice, Louisville, Ky.-We inclose you a section and floor plans of a building and some other details and correspondence relative to our experiwith a warm air furnace. aubmit this for publication in your paper believing it will be of benefit to the trade. Fig. 1 shows a longitudinal section of the building and Fig. 2

last winter, the first winter we used it, it failed to perform what we think it should. We think it not so much the fault of the furuace as the parties who set it, and we wish to get some luformation from you, and will proceed to remedy the defects ourselves. The amount of space to be heated is 98,000 cubic feet, and the cold air inlet is only 12 x 29 inches. The united area of all the pipes leading from the furnace is 1026 square inches. We wish you would send us (at once) one of your catalogues giving information as to settings, pipe, cold air duct, &c., also any additional information that you can suggest. We used 750 bushels

A Rearranged Heating Plant.-Fig. 1.-Longitudinal Section of Building.

shows the plan and the furnace piping | as it was used.

During the winter of 1892-93 the furnace had to be driven to auch an extent that the fire bowl was burned out and the heat was so intense at the base that the tin lined galvanized iron casing was heated until the coating was burned off the bottom both inside and outside; at the same time, if we opened the dampers full in two of the largest pipes the other pipes received compara-tively little heat, so that the shop sufof coal last winter. An early reply will oblige Yours respectfully, CORNICE.

The following letter is the answer we received:

Messrs. Cornice, Louisville, Ky.:
Gentlemen—Your letter of the 30th ult.
at hand. You state that you take 1026
square inches of air from furnace; this is
altogether more than we would guarantee
our No. 1 furnace to do. For the amount
of work you have, we judge that our No. 2
furnace would be about right. The fire pot
is 35 inches in diameter, casing 65¼ inches
in diameter. We would recommend size of

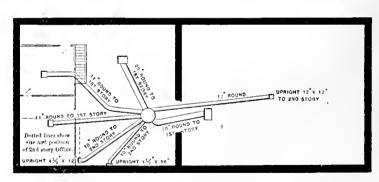

Fig. 2.—Showing First Method of Piping.

fered when we attempted to keep the office warm. In addition to this, about the middle of the afternoon the men were all complaining of headache. Determining to remedy this before another winter, on September 30 we wrote the manufacturers of the furnace thinking they would take sufficient interest in the matter to advise us fully what to The letter herewith shows what do. we asked:

LOUISVILLE, KY., September 30, 1893.

MESSES —. GENTLEMEN.—We have in our building one of your No. 1 hot air furnaces, and

cold air supply for our No. I furnace about 550 inches; your box contains only 348. The No. 2 furnace will take care of 700 square inches of cold air. If you could fill out the inclosed we would have a better idea as to what you would require. We have no book giving directions for setting. Yours respectfully,

Now we had no experience in furnace setting, but we proceeded to dismantle the furnace, and after getting a new fire bowl began the setting; we in-creased the capacity of the cold air duct to 660 square inches and reduced the

building all the time and no complaint from the men of headache.

#### Tinning Malleable Castings.

From R. G. O., Manitowoo, Wis.— I take the liberty, as one of the subscribers of The Metal Worker, of asking for a little information regarding the tinning of malleable iron. What kind tinning of malleable iron. of acid is used, and is it raw or boiled? Are the castings heated after being dipped in the acid? Is anything added to the block tin for tinning, and how hot should it be?

Answer. - Before the castings can receive a coating of tin it is necessary to remove the coating of scale or oxide, so the clean metal will be exposed to the tin. The castings are usually partly cleaned by means of the "rattler," which removes much of the scale. They are then to be placed in a pickle of dilute muriatic acid until a clean surface is the result. If the pickle is warmed by means of a steam jet, the operation will be hastened. The castings can be examined occasionally while in the pickle, and any sand or black spots removed by means of a scraper or wire brush. The castings can then be washed, and if desired, kept for a length of time by being placed under clean water. As long as they are covered with water they are not subject to oxi-

dation. For a tlux, the castings are dipped in a mixture composed of four parts of a saturated solution of salammoniae and one part of muriatic seid. "Boiled" acid, as that combined with zine is sometimes called, is not to be used. For tinning, the best block tin is required, and this should be melted in an iron pot, care being taken that it is not burned or overheated in melting. After the tin is melted, it can be cleaned of impurities by taking a piece of green or wet wood secured to a pointed iron rod, and fastening same so the wood will be kept at the bottom of the pot of melted metal for one or two hours, depending on the amount of impurity in the metal. The surface of the metal is to be akimmed occasionally by means of a perforated iron skimmer. To protect the surface of the metal from oxidation, it can be covered with sal ammoniae. There is nothing to be added to the tin. Another method is to cover

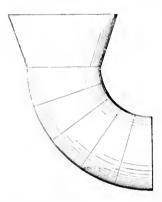

Fig. 7.-Rearranged Register Box.

the aurface of the tin with tallow or palm oil. The casting is taken up by means of auitable tongs, dipped in the flux, and then immersed in the melted tin and held for a sufficient time to allow the surface to be tinned. The tin should not be so hot as to discolor when the casting is removed. If deaired, the casting can be held for a time in another pot, which is to be partly filled with tallow or palm oil and kept at a temperature that will melt cold tin. This bath of grease will allow the casting to retain an even coating of tin, and allow any auperfluous metal to drain off. The castings can be cleaned from the grease by first rubbing in sawdust and then in bran.

According to a recent consular report, the decree issued by the Government of San Salvador, imposing an additional duty of 25 cents per 100 pounds upon all imports, does not apply to products of the United States.

United States Minister Buchanan reports the present year's wheat crop of Argentina to be phenomenal. The increase in acreage over last year la estimated at 20 per cent., and the yield per acre has also increased. It states that 36 000,000 bushels were exported during the first three months of this year, and there atill remain in atore for export 30,000,000 bushels.

# PLUMBING and GAS FITTING.

## Gas and Gas Fitting.—IV.\*

BY J. W. HUGHES.

#### Connecting the Meter in Buildings.

In most cities the gas is introduced directly into the buildings to be lighted by the gas company. For an ordinary dwelling the usual size of a service pipe, as the pipe leading from the street main to inside the building is called, is 1 inch. It is generally wrought iron pipe with screw joints, put together with the ordinary socket or buckle, and made tight with red lead. Sometimes a stop cock is fitted in the service outside the building for the purpose of cutting off the supply, but in many towns this is omitted, the pipe inside the house being merely closed with a cap.

When the gas fitter comes to make the final connection between the gas company's service and the house pipes, he removes this cap, having first prepared a proper fitting with a nipple and cock to screw on the end of the main or service. The proper fitting to use is a T with a plug in one end. In cold climates it is customary to fit to the end of this T a cock to which a small funnel is attached. This is for the purpose of introducing alcohol to thaw out the main should the flow of gas become di-minished by the accumulation of frost in the service. Gas does not freeze in the same way that water does—that is, into solid ice—but during severe and long continued cold spells frost gathers on the inside of the service, similar to that which gathers on the inside of the window glass, and for the same reason. The moisture carried by the gas is con-densed on the sides of the pipe in such quantities as to sometimes completely obstruct the flow of gas.
"Highwinea" or alcohol introduced

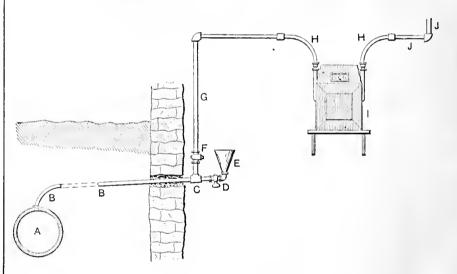

"Highwinea" or alcohol introduced into the pipe cuts this away, and if the service has been laid with ample fall from the house to the street main, it runs off into the large main and from there to the various siphons placed at intervals along the line of the atreet mains, from which it is periodically pumped by the gas company men, along with the ordinary liquid of condensation that forms in the mains and which is known to the general public as gas water. Should there, however, be a depression or trap on the service the alcohol will lodge there and as a result there will either be no flow of gas or it will come in jerks or jumps, causing the flame at the burner to jump up and

This jumping is also caused by the ordinary liquids formed by the condensation in the gas. The proper and only thoroughly effective remedy for this is to dig up the service and lay it so as to be free from traps or depressions. The trouble may be temporarily cured by removing the plug or funnel on the end of the service, and having fully inflated the lungs, placing the mouth over the opening made by the removal of the plug and blowing strongly into the service until the accumulation

Copyrighted, 1894, by David Williams.

of liquid is blown out of the trap and back into the main pipe. This is not the most pleasant job for the gas fitter, but it is a prompt and handy method of getting rid of the trouble. When no getting rid of the trouble." plug has been left a joint may be unscrewed or the key taken out of the stop cock, or the coupling may be taken off at the meter and the alcohol be introduced at any of these points, as most convenient, and the blowing out be done from there if necessary. It sometimes occurs that the force of the lungs is not sufficient to free the service from the accumulated liquid. Then a force pump must be used, or a wad of rag, well greased, can be attached to the end of a strong wire and this be forced into the service to a point beyond the line of obstruction. If this is not possible, a closely fitted wad of rag firmly attached

Having attached the stop cock to the main inside the house, it is next in order to carry the service to the vicinity of the meter. The final attachments between the street service, the house main and the meter should be made with a short length of lead or "compo" gas pipe. The meter should not be connected direct to the iron pipes. This is something often done, but unless great care is taken to have the different parts or joints come perfectly together without spring, a strain is put upon the meter it is not strong enough to stand, serious injury to the meter is almost certain to result, whereas if a short piece of "compo" is used at the meter, it can be much more easily handled, and there is leas likelihood of damage to the meter from the aforementioned cause. The meter

Gas and Gas Fitting .- Fig. 12.-Meter Connections.

to a wire will answer all the purposes of a force pump.

When working at gas pipes with gas on, as is sometimes necessary, especially in executing any of the aforementioned work, great care must be taken to prevent the gas taking fire. No light should be anywhere in the vicinity, and as the services are frequently situated as the services are frequently situated in dark cellars it adds to the awkwardness of the work. For this reason everything in the way of a most perfect preparation should be made and the light removed before any pipes are opened. Fittings should be tried to make sure they will second on to the make sure they will screw on to the pipe, so that a man working in the dark will not be unnecessarily embarrassed. It is always better to open a window to the outer air while such work is being done, and even after the special work has been accomplished a light must not be brought into the apartment as long as there is a strong odor of gas, as gas in the proportion of seven to eight parts of air to one of gas is highly explosive, and enough will accumulate in a few minutes in a cellar to form an explosive compound of sufficient force to wreck the building.

couplings are usually made from "compo" connections. The end of the "compo" pipe that is to be attached to the iron pipe must be soldered into a proper brass serew tail, or brass bush, for screwing into the iron pipe fittings. The meter connections described above are shown in Fig. 12. A is the street main; B B, house service; C, the T on end of service; D, amall cock attached to funnel E; F, main stop cock; G, continuation of service to meter I; HH, "compo" pipe connections to meter; J J, house main.

THE ETTE & HENOER MF6. COMPANY, St. Louis, distribute a pamphlet of eight pages to be inserted in their catalogue No. 5, which was recently issued. The pamphlet contains illustrations of a new iron and a new brass bracket, which are made in several sizes, and as the manufacturers inform us, are finely finished. Illustrations are also given of the National and Globe traps, the National basin waste and National bath waste. A line of brass towel racks, sponge and glass holders and brass, nickel plated soap cups are also shown.

#### Water Closet Reservoir.

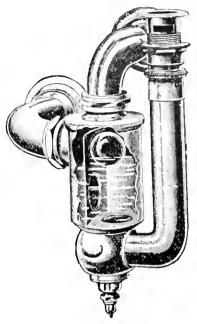

McCambridge & Co. of Philadelphia have just patented the water closet reservoir shown in the accompanying cut, the invention of Geo. B. Howell, a

member of the company.

The main feature of the invention is the combination of valve mechanism with a reservoir in such a manner that the valve operating rod or chain can be discovered in any position which the be disposed in any position which the location of the bowl of the closet may suggest as the most convenient.

ment of the rock shaft in one direction is limited by lugs on the front end of the shaft and the adjacent bracket, thus preventing contact of the valve arm with the top of the overflow tubes. The upper chamber has lugs on either side for receiving the cheat of the supply valve so that the chest may be mounted close to the wall in either po-sition of the chamber. Around the lower discharge valve is a low casing or wall with openings of limited area near the bottom so that when the water in the service chamber has fallen to the

The trap is constructed with a partition having a hole in it, so that in case of siphonage the ball is drawn against the opening, preventing the breakage of the water seal. If the trap is left un-used for a period long enough to evaporate the water, leaving it dry, the ball

Sink and Basin Trap.

Water Closet Reservoir.

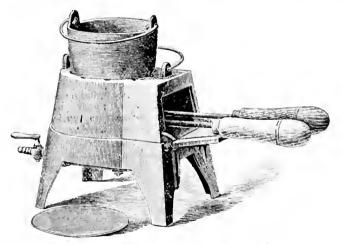

cut shows a broken veiw of the supply reservoir. It consists of two casings, a main or outer casing and a supple-mentary casing, forming two chambers, the upper serving as a receiving cham ber and the outer as a supply or service chamber. The two chambers comchamber. municate by means of the valve shown in the left of the cut, and the service chamber discharges through the branch controlled by the outlet valve. The ends of the rock shaft, to which is attached the arm operating the valves, are adapted to suitable bearings in brackets secured to the upper flanges of the inner chamber, so that when the shaft is operated the delivery valve will open and discharge the water from the service chamber, and at the same time close the valve of communication between chambers. A reversal of the shaft movement closes the delivery valve and opens the communicating valve, so as to allow of a refilling of the service chamber from the upper chamber. The rock shaft is provided with an operating arm to the end of which is connected a de-pending rod or other valve operating device, and either attached to the seat in such a way as to make the operation automatic, or attached to an ordinary chain pull. The discharge outlet and its valve occupying a cental position in the service chamber the rock shaft may be located on either the right or left hand aide of the valve, the inner chamber being readily removed and turned end for end to permit of such arrangement. The hub of the operating arm may be adjusted to different circumferential positions on the rock shaft and secured, after adjustment, by a set screw. The arm may also be adjusted longitudinally on the rock shaft so that it may assume any position between the end of the shaft and the central valve operating the arm. The valve arm is operating the arm. usually placed at the middle of the shaft when the chamber is turned end for end the same arrangement will suit the valves. The swinging move-

level of the top of the casing or wall further flow will be through the openfurther now will be through the openings, thus providing a slow after flow for filling the traps of the bowl after siphonic action has ceased. In operation, pulling of the operating arm releases the water in the inner chamber and the service chamber provides the and the service chamber provides the flush. During the flush the inner chamber again fills and is ready for another flush. There is always a flush ready at hand. The company have used the reservoir for some time in their own

ainka and closes the opening leading to the fixture, thereby, it is claimed, preventing the entrance of sewer gas into the house. The trap is furnished with an improved patent overflow basin and trap connection, doing away with the old style overflow basin plug.

#### The Enterprise Gas Soldering and Plumbers' Stove.

The accompanying illustration shows a general view of the Enterprise gas aoldering and plumbers' stove, just put

Enterprise Gas Soldering and Plumbers' Stove.

work, particularly in hotel and other large contracta where automatic service is required.

### Sink and Basin Trap.

We show in the accompanying illus-We show in the accompanying litteration a patent sink and basin trap made by William Kerr, 507 Detroit street, Cleveland, Ohio. The trap is provided with a ball, which fills the back air vent, preventing its stoppage by grease or other matter entering should the trap by any means be flooded.

on the market by Luther & Lederhos, 30 Cliff street, New York. The general appearance of the stove is made plain in the engraving, from which it will be seen that two soldering irons and a plumbers' melting pot can be heated at the same time. The gas connection is at the back of the stove, as indicated. There is also a lid for closing the top when the melting pot is not used. The consumption of gas is about 10 feet per hour and the stove will melt a pot of solder in from eight to ten minutes. It also heats 4-pound coppers in from eight to ten minutes. It heats very quickly and there is said to be no smoke or smell.

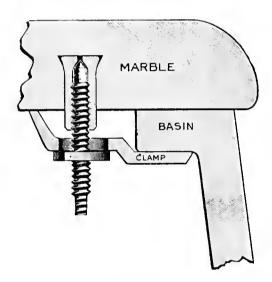

# Calkin's Patent Expansion Bolt.

We present in the accompanying illustration a view of Calkin's pstent expansion bolt, made by T. J. Mcllugh, 292 Washington street, Boston, Mass. The bolt is intended for use in securing fixtures to marble slabs. In setting the device it is merely necessary to drill a hole the size of the bolt, and then with a cutter specially made for the purpose, and supplied by the same manufacturer, the bottom of the hole is reamed out. increasing its diameter, the bolt being threaded in the center to receive a screw with a nut. It is also slotted at four different places, and the hole in the device so tapers to a point that when the screw is inserted the bottom of the bolt, expanding in the hole, becomes so secure that it is said to be practically impossible to withdraw it. It is claimed B. T. Connell of the B. T. Connell Plumbing & Heating Company, St. Joseph, Mo, and George Kirtley of Kirtley Brothers, Kansas City, are looking over the ground with a view to eatablishing a business house in Sedalia, Mo. It is reported that they will handle a full line of fancy and ornamental sanitary fixtures, and do a general steam, hot water and plumbing business.

THE JAMES B. SMITH PLUMBING & HEATING COMPANY have been incorporated at Cleveland, Ohio, with a capital of \$25,000.

WILLIAM N. TOPHAM has removed his plumbing establishment from 110 East Chelton avenue to 5623 Main street, Germantown, Pa.

Jules E. Zimmerman of the Ideal Mfg. Company, Detroit, visited the plumbing and heating trades in Boston this week. The auperior atyle and finish of the Ideal closet seats and flush tank render them very popular in this section. Another specialty of the Ideal

Calkin's Patent Expansion Bolt.

that the bolt can be quickly set, making a very substantial job. The illustration shows a lavatory slab attached to a basin by a spring clamp held in position by one of these bolts. The spring clamp keeps the basin in position, affording sufficient elasticity to prevent the breakage of the earthenware.

#### TRAPS AND VENTS.

A SIN STORY BRICK AND STONE BACK BUILDING, 15 x 20 feet, is to be added to the plumbing establishment of Watson & Pearle, Chestnut street, above Seventeenth, Philadelphia.

The Zero Valve Company, 212 Seneca street, Buffalo, N. Y., are issuing their first catalogue to the plumbing trade. It is bound in brown covers and its pages present views and descriptions of the Zero and Vollmer anti-freezing closet valves for use in connection with outside water closets. The Vollmer closet sent is a lift seat made of highly polished cherry, strengthened by a circular malleable iron ring, and adapted to be connected with hopper water closets. It can be quickly connected and requires no other wood work in connection with the closet.

H. F. WEEKS has associated himsell with the Hinekley Brothers, at Barre, Mass., to carry on the tin and plumbing business.

Mig. Company are the Ideal quick closing valves for use in hot water heating, which find a good market in Boston.

KINO & GODDARD, 64-66 Purchase street, Boston, make a specialty of pipe fittings, pumps and hose, and in addition, carry a full line of plumbers' supplies. They are distributing a neat little memorandum book, bearing the inscription: "When this is used up call or send for another."

THE STHSON wrench and Walworth pipe dies are too well known to the trade to need extended description. They, however, comprise but a few of the varied lines of goods adapted for the plumber and steam fitter manufactured by the Walworth Mfg. Company of Boston.

THE ALBERENE STONE COMPANY, 217 Lake street, Chicago; 393 Pearl street, New York, and 162 Dover street, Boston, have just brought out an exceptionally fine catalogue of their specialtics. They make laundry tubs, sinks, urinal stalla, tops for dissecting tablea, acid tanks, oil vats, nickel plating troughs, horse troughs, &c., of a peculiar stone quarried at Alberene, Va. This atone is of a gray color, having a fine close grain of uniform density, wears as smooth as polished marble, and is peculiarly fitted for sanitary work by its non-porosity, strength and durability. The catalogue comprises 36 large pages, with handsome illustra

tions and letterpress, printed on heavy paper, and is bound in a stiff cover, dark blue in color, with embossed lettering in white. Of the contents, laundry tubs are the conspicuous feature. These are shown in a great variety of sizes and styles. Then follow combination kitchen sinks and laundry tuba in considerable variety. Kitchen sinks are next shown, designed for clear wall spaces or right or left corners. Some have single drain boards and others have drain boards on both sides. The convenience of the country resident is conaulted by a special form of sink with a board for a pump stand at one end. Urinal stalls receive considerable attention, as well as miscellaneous specialties. The stone is stated to be adapted to a great number of uses, such as hearths, grate liuings, range linings, bakers' oven linings, griddles, foot warmers, tubs for electric baths, awitch boards and cut outs for electric use, &c.

THE DECECO COMPANY, Boston, have their showroom attractively arranged, samples of their plumbing specialties being displayed to the best advantage. On one side of the room the floor and wall is tiled, and various atyles of their water closets are set up with water connection, for the purpose of showing their operation. At the opposite side of the room are displayed varied styles of lavatories and lavatory fixtures, the central space being occupied by a collection of porcelain and enameled baths, laundry tube, slop sinks and urinals.

The anniversary edition of the Binghamton Morning Message, Blnghamton, N. Y., contains a complimentary notice of the firm of Gaylord & Eitapence, the well known heating contractors of that city. The business was established in 1889 by W. H. Gaylord and L. F. Eitapence, the present proprietors, who have built up an extensive trade extending throughout a large section of New York and Pennsylvania. The article refers to many of the big contracts that have been undertaken by this concern.

REPORTS in the local journals of Dubuque, Iows, speak of the large amount of plumbing and steam heating work that is being done in that city at the present time, due to the discontinuance of the steam heating company, which supplied several hundred stores, residences and offices with heat.

THE MASSACHUSETTS ASSOCIATION OF MASTER PLUMBERS have elected the following officers: President, Frederick Crossman of Florence; vice-president, T. J. Carmody of Holyoke; secretary, A. C. Mosely of Westfield; treasurer, J. W. Kennely of Springfield; Executive Committee, G. H. Farrel of Westfield, A. B. Lee of Northampton, C. P. Lyman of Holyoke, M. A. Donoghue of Springfield.

JOHN L. E. FIRMIN, a leading plumber of San Francisco, has been making an extended trip to the East, stopping, among other places, at Milwaukee, where he visited the trade.

According to the Wall Street News, the water works supplying the principal cities and towns of the United States represent an investment of \$430,000,000, or nearly one-tenth as much as is invested in railroads. The total number of cities and towns in the whole country supplied with water works is about 1700. Of these, eight Southern States only include 68 water works. About two-thirds of all the works belong to the municipalities, the balance being private enterprises.

# TIN PLATES.

## The Decrease in Tin Plate.

The British Board of Trade returns for the month of June, 1894, show a falling cff of about 38 per cent. in the shipments of tin and terne plates from Great Britain to the United States during the first half of this year, as compared with those in the corresponding period of 1893. For the six months ending with June 30 last the total shipments of tin plates and sheets are given as 100,364 tons, as sgainst 160,420 tons in the half year ending June 30, 1893, a decline of more than 60,000 tons, or nearly 1,000,000 boxes of IC, 14 x 20. This serious contraction is, of course, largely to be attributed to the generally depressed state of business in the United States during the past six months and, above all, to the condition of uncertainty in regard to tariff legislation, under which the tin plate trade has been laboring for so long. Importers have in most cases narrowed down their orders to the smallest margins, in view of a possible reduction in the tin plate duty, which would enable them to enter their goods at a lower rate, and consumers at large have followed a similarly conservative course in buying no material beyond what their pressing needs demand.

Consequently, consumption has narrowed materially and stocks on this side have become reduced to a very Yet there is no evidence to low ebb. show that the consumption of tin and terne plates this year has shrunk to the extent of snything approaching 38 per cent. of the average. On the contrary, 20 or, at the most, 25 per cent is the outside shrinkage calculated by dealers and jobbers. The difference must be accounted for by the using up of old stocks and the adoption of the domestic product, which, it is scknowledged, has assumed a position of more and more importance in the market during the current year. The frequent diffi-culties which have been experienced by consumers in getting their orders for special brands of imported plates filled, owing to the slender stocks recently carried by the importers, have in many instances thrown the sometimes unwilling consumer back on the American made material, which he has thus had perforce to use, often for the first time, and has subsequently learned to appreciate. Thus the decrease in the importation of foreign plates has been a dis-tinct gain to the home manufacturers. Of this they have not been slow to avail themselves, for in strong contrast to the importers they have nearty all been busy to their utmost capacity and generally have reported a good and growing demand for their product during the past months of business depression.

#### SCRAP.

THE PLANT of the Canonsburg Iron & Steel Company, Canousburg, Pa., manufacturers of fine sheet iron and sheet steel, was closed down on Saturday, June 30, for stock taking and repairs. It is expected the entire plant will resume operations about August 1 next, and the new tin mill recently

erected by the firm will be put in operation at the same time.

THE PITTSBURGH TIN PLATE WORKS, New Kensington, Pa., msuufacturers of American tin and terne plates, have been succeeded by the Pittsburgh Tin Plate Works, Incorporated, which coucern were recently granted a charter of incorporation, with a capital of \$100,-000. The officers are as follows: Chas. Parkin, president; C. W. Tindle, vice-president; W. P. Beaver, scoretary; W. N. Voegtly, tressurer, and J. B. Strawbridge, general manager. As already noted in these columns, the new concern have let contracts for the erection of suitable buildings and machinery, and when these are completed will manufacture their own sheets for tinning purposes, instead of buying them in the open market as heretofore. The main building is to be 140 x 100 feet, boiler house 45 x 35 feet, and pickling house 40 x 30 feet. The engine is a Hamilton Corliss, with cylinder 36 x 72 inches and fly wheel weighing 60 tons. The plant now under construction is designed for three hot mills, with a view of enlarging to six when desired. It is stated that the plant will be of the most modern design, and the best in arrangement that can be secured. It is hoped to have the work now under way completed by October 1, and with that end in view a large force of workmen have been engaged and are pushing the construction as fast as possible.

SHIPMENTS of tin and terne plates from Great Britain to the United States in the month of June, 1894, according to the British Board of Trade Returns, were 17,247 tons, as compared with 21,-291 in the previous month and 26,759 tons in June, 1893.

Work is precessing actively on the building for the new tin house to be attached to the rolling mill of the Laisnee & Grosjean Mfg. Company, at Harrisburg, Pa. Orders have been placed for the necessary tinning machinery and for cleaning and dusting machiner, &c. These will be ready to be installed as soon as the building is completed. Six tinning sets will be placed in operation as a commencement, and space will be provided for ten more pots, which will be added later. It is the intention of the firm to make this a complete modern tin plate plant, possessing all the latest improvements in the way of labor saving machinery. They expect to be in shape for making tin plate about September 15.

MEURER BROS. COMPANY'S TIN PLATE WORKS in Brooklyn are very lully cocupied on orders. Six sets are now in operation—five on ternes and one on bright plates—turning out an average of 325 boxes daily. For the present the works are only running on single turn, but Messis. Meurer are contemplating starting a night shift ou account of the press of orders for their guaranteed roofing plates, which have attained great popularity in the trade. The output of tin and terne plates from the works during their first whole quarter—that ending June 30—was 982,000

pounds. It is the intention of Messrs. Meurer to install four more tinning sets shortly and to make some considerable improvements and additions to their plant, including an automatic steam pickler and other labor saving machinery, now in course of construction.

Aluminum Castings .- We have received from the H. H. Franklin Mfg. Company of Syracuse, N. Y., a number of samples of small aluminum castings, which show marked progress in this class of work. We understand that they have been produced by a new process. Among the samples is a gear wheel, 11 inches in dismeter, with 36 teeth, which are sharp as though cut. A rack and a ratchet wheel, both cast, have some of the surfaces beautifully polished. The makers claim that they have overcome the difficulty of shrinkage and that they can make castings from a fraction of an ounce up, accurate and to size. We are informed that on many lines of work the finished product in sluminum, even at the p-esent price of the metal, can be produced highly polished cheaper than the same article can be made and finished and plated in brass. The H. H. Franklin Mg. Company produce these castings from pure aluminum, but when it is desirable to avoid the danger of scratching polished surfaces, the work can be produced with any hardening alloy. It is probable that there is a wide field for small castings of this character.

The City of Brooklyn is threstened with a shortage in its water supply. This week, after a lengthy discussion of the matter, the Board of Aldermen voted the appropriation of \$750,000 for increasing the supply. The Commissioner of Public Works has advertized calling for proposals for the work.

A local paper published at Washington, Ill., describes an invention of G. C. Danforth and William Sencendaugh for increasing the flow of natural gas where the original pressure is insufficient to give a continuous flow. The device is known as a combination natural gas vacuum pipe pump, lujector and mixer, and is, we understand, being auccessfully used on three light pressure wells in Washington.

The House has passed a much needed bill, introduced by Representative Stone of Pennsylvania, to regulate immigration. It provides that no immigrant shall be permitted to laud unless he shall exhibit a certificate signed by the United States Consul or other representatives of this country at the place nearest where the immigrant last resided, showing that au investigation concerning the immigrant has been made, and that the latter does not belong to the class of persons who are liable to become a public charge. The strict enforcement of a law of this character would do much to remove the evils arising from the admission of undesirable foreign immigrants.

# STEAM AND HOT WATER.

#### Class in Steam and Hot Water Heating.

The following particulars relating to the new day class in steam and hot water heating at the New York Trade School, First avenue, Sixty-seventh and Sixty-eighth streets, New York, are given in the catalogue of that institution, just issued, for the sesson of 1894 95:

A three months' day course of instruction in steam and hot water heating will be commenced on January 2. 1895. Certificates will be awarded on April 4 to those who pass the examination, which is held during the last week of the term. The instruction will Certificates will be awarded on be given every day from 8 a.m. to 4 p.m., except on Saturdays, when the school closes at 2.30 p.m.
Terms: Forty collars for the course,

paid when name is entered. Good hoard can be had at \$5 per week. The class in steam and hot water heating will be under the supervision of the Trade School Committee of the Master Steam and Hot Water Fitters' Association of New York, consisting of Messrs. John J. Smith, S. J. Geoghegan, Enoch Rutzler, J. D. Clarke, James Curran and Charles J. Gillis.

The instruction will be both practical and scientific. The manual part of the course will comprise work of the same nature as is done in establishments conducting a business of this character. The theoretical part of the course will be given by means of lectures, in which the scientific principles that form the basis of the construction of heating systems will be thoroughly explained. A part of this course will consist also of the drawing of plans. On each plan that is made the pupil will be required to show how the piping is to run, where the radiator or heating coils should appear and the proper place for the boiler or heater; also to give the sizes of pipes required, fittings, &c. Then from plans so prepared the work itself will he done.

#### English Heating Practice.

From an interesting paper on the "English Practice in Heating and Ventilation," read by David M. Nesbit of London at the recent New York convention of the Master S:cam and Hot Water Fitters' Association of the United States, we print the following extract:

To make this paper interesting to you, I have thought of many subjects, but as I feel more of a student than a professor, I have come to the conclusion that a review or retrospect of the warming and ventilating profession in England as I have known it during the last 20 to 25 years would be most interesting.

It is undoubtedly a blot on our En-

glish race, nay, civilization I might say, to have allowed this matter of warming and ventilation to be neglected for so many years, but I am glad to be able to tell you that, with the close of the nine-teenth century, better opinions prevail

and better warming and ventilation is much sought after.

The people themselves, the Government, and their representatives, are now compelling employers and public bodies to see that their workshops, public buildings, schools and other institutions are better warmed and ventilated than they used to be.

This is a sign of the times, but we have much to do before this humanizing effect becomes general, and I am afraid that pecuniary interests, private enterprice and trade nostrums militate much against its general adoption, but as surely as I am in New York to day compulsory powers will eventually come into force and aweep away those devices which are only a snare and a trap for the unwary.

In England, or, properly speaking, Great Britain, I might say we are pass-lng through the "transition" state of

warming and ventilation.

In the early part of my career it was considered quite good enough to run 2, 3 and 4 inch plain socket and spigot piping all round the rooms of our schools and other public buildings, with additional "box coils" for additional heat where required. These were used mainly in conjunction with low pressure hot water systems, and some of the best buildings built two or three decades ago are heated in this manner, without (in many cases) a vestige of ventilation whatever.

To say the least, this system was not artistic, scientific or very architectural, but it was the custom, and the latter had to be maintained too often at the

cost of injury to health.

The principles of ventilation in Great Britain were little understood except to the few men whom I consider were the pioneers of the better systems of warming and ventilation.

To such men as the late Drs. Read, Percy and Carnelly, and engineers such as the late Chas. Hood and W. W. Phipson, we owe a debt of deep gratitude for maintaining a high standard in their designs and works which were intrusted to their care.

In some older works it was (and is now still, I regret to say) too often considered the right thing to insert one or two small Tobin tubes in a class room for 50 or 60 children, the result being that when ventilation was most needed these beautiful inlets-such as they were—were closed or stopped up to suit this or that faddist.

It is not an uncommon thing to note a Tobin tube 9 inches by 3 inches considered quite the proper thing for a room of 8000 to 10,000 cubic feet, such a room in our English achools accom-

modating 60 children.

Again, many architects and engineers considered it quite sufficient to have the inlets alone without any extraction whatever, and some going to the other extreme, they thinking it not necessary to have any inlets, but plenty of outlets. These sentiments, I am glad to tell you, are falling rapidly into oblivion, and the better architects and engineers are readily fulling into the idea of Shake-apeare, who made one of his characters say, "Where air comes in, air must go

out," and when this is more appreciated we shall undoubtedly raise the standard of warming and ventilation in Great Britain.

Steam heating was little practiced in England at the period I am now speaking of. At times one would see exhaust steam used for warming workshops and the like, but it was done in such a primitive fashion that it never made any headway. Hot air, too, had its day, several inventors, to my mind, having wasted much valuable time and money in bolstering up a rotten system. Some of the best scientists who have investigated this form of heating have signally pronounced against its continuance.

The only redeeming feature hot air heating has, to my mind, is its cheapness, but this is a small matter when it is borne in mind that we are imperiling perhaps thousands of lives by its adoption. It is dirty, dangerous to property, and the air given off is detrimental to health. The same remarks may be made about the high pressure hot water system, which was much used in England years ago. Both systems are falling into disuse, and I hope to see the day when they will be practically discontinued.

Of course we have in England a Blackman-Smead system of hot air heatlng, and this, to my mind, ought to be classed among the systems that ought to be abolished. I need not dwell upon this, as you are fully alive to the Smead system in the United States.

I think the great revolution in warming and ventilating in the old country took its era about ten years ago, and since then many good men have joined hands in promoting its birth, so to speak. I think that the radiator known in England as the Leeds radiator, but better known in your country as the Bundy, is largely responsible for the evolution of warming and ventilating that I am now speaking of. It was Lewis Leeds, I believe, who introduced the radiator into England, and who executed works on his own account for some time, but was not over successful, for what reason I cannot say; but after his departure from England the late Mr. Phipson took up this radiator and used it for both steam and hot water, with much success.

I think much of the credit is due to the late Mr. Phipson for the way in which he helped to inaugurate and develop a better system of warming and

ventilation in my country.

About the time of the introduction of the Bundy radiator I became associated with Mr. Ashwell of Leicester, and since that date we have made it our duty not only to develop our business but to improve each succeeding contract that was placed in our hands.
We have had no atercotyped lines to

work on beyond the primary principles of warming and ventilation. Each job has been considered and designed ac-cording to its own special requirements, and we have not attempted either to lay down a law that such and such goods as we make ourselves shall be used. We have aimed at having the best articles within our reach, whether of our own make or not, and this I believe has materially contributed to our success in the warming and ventilating business.

The first step in our early days (ten years ago) it was considered sufficient to give 500 cubic feet of air per child per hour, in our board schools, this being done by automatic ventilation.

In the early works coils of gilled pipes or gilled elements covered with cases were fixed in recesses under windows, to which air was admitted; the coils being worked with ateam or hot water, as best suited the case. In the second step we got to coils of gilled pipes with air gratings at the back, so as to diffuse the air over a large surface. This we found very efficient and much cheaper and less dirty, as the castings to coils were found to be receptacles for all kinds of fifth and rubbish. In the third step we got to the "plenum" system, which, to my mind, is superior to all others when properly applied.

The extraction for these systems was invariably an aspirating shalt through which a cast iron flue would pass, taking the products of combustion from the boiler, thus helping to rarefy the vitiated air and causing extraction. In aummer time we would use a "pllot stove" for warming the smoke pipe for the same purpose. I may here say that we proved beyond doubt that a combined system for warming and ventilation was not only permissible but absolutely requisite, and that we were on the eve of something better still.

# Hot Water Heating From Steam Boiler.

From R. Y. W., St. Louis — Having seen the letters of "Rex" and W. H. Page in The Metal Worker, May

duced to run the pipe as shown by the dotted lines, and no difficulty has since been experienced in heating all the radiators connected on the system.

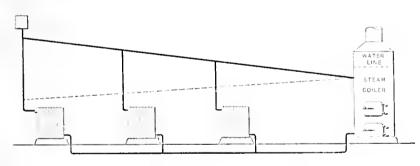

#### HEATING NOTES.

We are independent to the Richmond Stove Company, Norwich, Conn., for a catalogue of the Richmond Sectional heater No. 224. The apparatus is thoroughly described and illustrated and testimonial letters are given, while incidental reference is made at the end of the catalogue to other heaters of the Richmond Company's manufacture. The second catalogue relates to the Richmond Sectional heater No. 320 and 327 with revertible flue. This heater is similarly described and illustrated.

THE NEW ROYAL STRAM HEATER COMPANY, Gardner, Mass., have started up work in their new shop on South Lincoln street.

One of the Later issues of the catalogues relating to the Richmond steam and hot water heating boilers carries the name of George T. Barnes, engineer and contractor, Newburg, N. Y.

THE VAN AUKEN STEAM SPECIALTY COMPANY, Charles P. Monash, manager, Chicago, Ill., issue an attractive catalogue of their manufactures and specialties. The first article noted is the Monash automatic steam air valve; then come the Perfected Duplex No. I air valves, Nos. 2, 3, 4 and 6. Other goods noted are the Midget steam air valve; the Fidelity steam trap; Van Auken's valvea; also low water alarm, pipe hangers, dust deflectors for radiators, &c. These goods are illustrated, full price-lists are given, and sufficient de-

Hot Water Heating from Steom Boiler.

19 and July 7, on heating radiators from steam boiler and as being of possible interest I send you a sketch of what I once discovered in this line. A boiler was used for heating a large building and after having been in operation some time it was necessary to heat some rooms on the same level as the boiler. The engineer in charge of the plant tapped the boiler below the water line and ran the pipe with a slight ascent for about 50 feet, attaching an air tank at the end. Branches from the flow main were taken to the top of hot water radiators on the floor and returns from the radiatora were run below the floor to the boiler, where they ascended and con-nected with it. It was found difficult to keep the system filled with water, as for a part of the distance the pipe ran above the water line, and the tank could not always be kept air tight. The pipe was given the ascent and the tank used because the engineer did not think the radiators could be heated if the flow pipe was run on a decline from the boiler. Owing to the unsatisfactory service rendered, however, he was in-

acriptive particulars to explain the chief features of the goods. The pamphlet is bound in red covers and contains 25 pages.

"EVERTHING in the ateam, gas, water and plumbing supply line" is what the Smith & Winchester Company of Boston, Mass., manufacture and deal in, according to the announcement on a recent advertising novelty. The other side of the card hears the question: "Do you want a snap?" and is a humorous explanation of how one may be obtained by pulling the accompanying elastic, "but it would not he in it with obtaining the exclusive agency for the Winchester boiler."

Dubois & Darragu, 61-63 Gold street, New York, who handle the Volunteer and All Right steam and hot water boilers made by the W. H. Page Boiler Company of Norwich, Conn., have placed the management of this department in the hands of Alexander Don. Mr. Don carried on a steam and hot water heating business at Newark, N. J., for a number of years, and is en-

tirely competent to lay out heating plans as well as superintend their installation.

Holland Radiator & Meg. Company of Chicago, III., have opened an office at 69 Centre street. New York, under the management of T. Holland. On their handsomely carpeted sample floor are displayed Holland radiators in various sizes and finishes. The attention of visitors is called to the method of connection employed in their goods. A male and female projection and recess, similar to an ordinary coupling, is cast on each section, and by means of right and left bolts, readily tightened or loosened with a flat wrench, the parts are securely fastened together. They lay particular stress upon the ease with which a new section may be added if necessary. Mr. Holland is about to make a trip through New York State and will carry with him for exhibition a sample radiator composed of sections of different hights.

F. H. Moore of the Howard Furnace Company, Syracuse, N. Y., visited the New York office of his concern last week. He notes an increasing demand for their Howard combination hot air and hot water heating apparatus.

THE HOWARD THERMOSTAT COMPANY issue from their New York office, at 202 Water street, a circular of the Howard automatic heat regulator, which they call the "Isothermo." This device is intended for use in connection with heating apparatus and is claimed to maintain a uniform temperature, and at the same time to effect some economy in the consumption of fuel.

The Model Heating Company are increasing the capacity of their Philadelphia foundry and adding several expensive machines in order to supply the demand for the Novelty steam generators, which are made in 12 sizes, capacity from 175 to 2000 square feet.

The Thayer Heating Company, 143 lligh street, Boston, Mass., are preparing for the fall campaign by thoroughly renovating their sample room, the walls and ceilings being pleasingly decorated. Their hot water heaters are painted a light drab, the relief portions of the decorations being gilt. All sizes of their boiler are shown, including small direct draft appsratus for use in connection with chicken brooders, kitchen boilers and conservatories, as well as larger sizes of the same heater with direct and indirect draft attachment. The several sizes of the Thayer improved hot water heater are also shown. An impression of great heating power is conveyed by the connection of two large sized boilers by means of the Thayer union. A new water top or auxiliary dome has been brought out, adapted for use with the company's regular line of boilers, which is claimed to increase the heating efficiency with the same consumption of fuel.

C. M. Converse, 96 Lake atreet, Chicago, Western manager of the Elwood Iron Works, is distributing a neat pictorial wall calendar for the last half of 1894. An illustration is given of an office heated by an Elwood radiator, lithographed in colors. The radiator is a conspicuous part of the picture and is shown to be of handsome design and finish. Another calendar is for July only and consists of a blotter attached to an enameled card. The card also bears a view of an office heated by an Elwood radiator. These radiators are made in all sizes, for steam and hot water.

# ROOFING AND CORNICE.

# Roofing and Cornice Instruction.

The following particulars relating to the new class in tinsmithing, roofing and cornice work at the New York Trade School, First avenue and Sixtyseventh and Sixty-eighth streets, New York City, are given in the catalogue for the season of 1894-95, just issued:

A three months' day course of instruction in tinsmithing, roofing and cornice work will be commenced on January 2, 1895, and certificates will be given on April 4. The instruction will be given every day from 8 a.m to 4 p.m., except ou Saturdays, when the school closes at 2.30 p.m. An examination is held during the final week of the course, and to those who pass a certificate will be presented.

TERMS: Thirty-five dollars for the course, paid when name is entered. Good board can be had for \$5 per week. The class will be under the supervision of the Trade School Committee of the New York Employers' Association of Roofing and Manufacturers in Sheet Metal, consisting of Messrs. M. Hallider, John Neil and Frank Shiller.

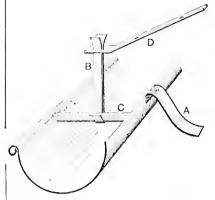

day, John Neil and Frank Shiller.
This course will embrace the tinning or covering various kinds of roofs, lining gutters, making leaders and chimney, ventilating and window caps, making simple and fancy cornices. The manner in which capping and cornice work is secured in position will also be shown, and pattern cutting as applied to roofing and cornice work will also be It is intended by this course taught. to offer young men an opportunity to learn in all its parts the roofing and cornice trade. The pupil will be capable of doing not only simple roofing, but will also have a knowledge of the more advanced and intricate branches of the trade that will enable him eventually to accept a position of responsibility.

A room fitted up with all the tools and appliances of a first-class workshop will furnish every convenience for conducting the work provided for in the

#### Eave Trough Hangers.

From G. E. B., Smyrna, N. Y.—Some time since I saw a method described in The Metal Worker by which a brother tinner used his tin scraps for making eave trough hangers. I use my scraps for the same purpose, but in a different manner from that previously described. Pieces of tin that are from 18 to 20 luches long I cut into strips 1 inch wide and use for stays, as shown by A in Fig. 1. These stays are brought around under trough, nailed to cornice, and placed 6 or 8 feet apsrt. Shorter strips, from 10 to 16 inches in length, are used for the uprights B, and are bent around the cross bars C and soldered to same. The cross bars C are made from pieces of tin 14 inches wide, and from 3 to 6 inches long, according to the size of trough they are intended for. These cross bars are formed in

triangular shape, placed with the opening down, in top of trough, and soldered at the ends. D represents a piece

Eave Trough Hangers.—Fig.1—Various Parts of Hanger.

of  $1\frac{1}{4}$  inch hoop iron cut 10 or more inches long, having a slot in one end and provided with holes for nailing to

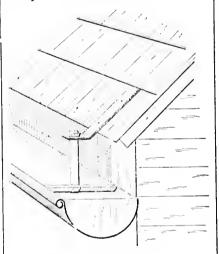

Fig. 2.-Trough Attached to Roof.

roof. D is nailed to the roof, as shown in Fig. 2, the upright B passed through the slot and drawn up so as to give the

In Fig. 3 is shown the die used for punching the slot in the end of hoop iron. The die is represented by F and attached to it is the guide E, which allows the hoop iron D to pass in the proper distance and insures the punch being placed over the opening in die. The punch G is represented in proper position for punching the band iron D. The punch and die can be made by any blacksmith and should not cost over 50 or 75 cents.

#### FLASHINGS.

P. H. Jackson & Co., San Francisco, received the award of honor for their Acme ventilators at the California Midwinter Fair.

Thir Gould Roofing Company of Long Island City, N. Y., were granted articles of incorporation last week. The capital named is \$200,000, and the directors are Charles M. Gould, William J. Gould and George A. Gould of Bridgeport, Conn.; William E. Burroughs, Harry C. Burbank, Geo. M. Flanders and James W. Taft of Brooklyn

G. DROUVE & BRO., Bridgeport, Conn., have been awarded the contract for the metal work in the New Bedford Standard's new building, at New Bedford. They are also supplying the metal work for the new library at Shelton, Conn.

THE AMERICAN ROOFING COMPANY, St. Louis, Mo., have just closed a large contract for corrugated iron roofing and siding, the details of which are not ready for publication. In addition to this contract, they are in receipt of a fair amount of smaller orders, and inquiries received indicate a good trade from now on.

THE YOUNGSTOWN IRON & STEEL ROTFING COMPANY, Youngstown, Ohio, have made application for a charter of incorporation, and will at once commence the erection of suitable buildings at Haselton, Ohio, for the manufacture of roofing. The incorporators are John O. Pew, Chas. E. Pew, L. E. Cochran,

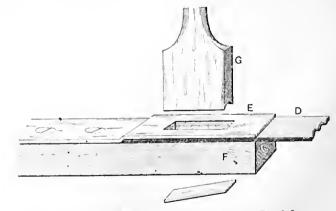

Fig. 3.—Die and Punch for Cutting Slots in Band Iron.

trough the proper slant. The upright B is then cut off 1 inch above D, the ends bent over each way and under, being pinched close with the flat pliers.

M. Evans and G. M. McKelvey. The company will use in the manufacture of their roofing a fastener invented by John O. Pew, who was formerly con-

nected with the Niles Iron & Steel Roofing Company, Niles, Ohio. The new concern will buy sheets from the Andrews Brothers Company, whose plant is also located at Haselton. It is proposed to equip the new plant with the latest modern machinery for the manufacture of roofing.

E. E. SOUTHER IRON COMPANY, St. Louis, Mo., report an excellent demand for corrugated iron for roofing and siding purposes. They have a good stock on hand and are able to make shipments promptly. They are also manufacturing lead washers, which are packed 100 pounds to the box, and for which, they advise us, they are having a large sale.

The Monson, Maine. Slate Company, 113 Devonshire street, Boston, have quarries from which they can supply high grade slate for all purposes, their Monson, Maine, unfading black roofing slate having established a reputation for color and toughness. In addition to the fastness of color, their slates are furnished full  $\frac{3}{16}$  inch thick, with both surfaces level and smooth, and the corners cut full and square. Holea are bored and countersunk if desired, as it is well known that slate is often so damaged in punching that after being on the roof for a time it cracks open and falls out.

JAMES J. WHITE, 185 Dearborn street, Chicago, is to furnish the copper cornice, gutters. &c., for the new school building on Henry street.

KNOOR & BLOCKS, 165 Wells street, Chicago, have lately taken the following contracts: Livery barn of F. D. Foster, Forty-third street and Ellis avenue, cornice, gutters, skylights and light shatts; Frank Gabel's residence, 158 Sedgwick street, copper cornice, skylighta and gutters; Henry Schultze's residence, Osgood street, galvanized iron cornice, skylights, &c.

# HEATING & PLUMBING.

#### NEW WORK AND CONTRACTS.

GAYLORD & EITAPENC, Binghamton, N. Y., have received a contract from the Bangor, Maine, board of education, to equip three large achool buildings in that city with apparatus for ateam heating.

W. H. CLARK, superintendent of the Lebanon Steam Heating Company, Lebanon, Pa., have received the contract for heating the building of the Treasler Orphans' llome, at Lyonsville, Perry County, Pa.

THE HIOH SCHOOL BUILDING, at Shrewsbury, Mass., 18 to be fitted with new heating and ventilating appliances.

AT THE MEETING of the Bullding Committee of the School Board of Brookline, Mass., the contract for heating and ventilating the new High School Building, was awarded to Kendrick Brothers, whose bid was \$16,397.

THE BUILDING COMMITTEE of the Memorial Church parish house, at Springfield, Mass., has awarded the contract for the heating apparatus to the Phillips Mfg. Company. A 12-section No. 4½ Mills boiler is to be used, and the radiating surface is to be something more than 2000 feet.

BARKER BROTHERS of Newport, R. I., have placed the following heaters: A No. 66 Richmond heater in the New-

port County Jail; a No. 515 Richmord hot water heater in Patrick Fagan's house; a No. 515 hot water in the residence of Mrs. Clarence Peckam, Hamilton, R. I., and two No. 55 Richmond heaters in the State House at Newport, R. I.

A NEW SYSTEM of ventilation is to be put in the Court House at Binghamton, N. Y.

O. S. KENDALL & Co., Worcester, Mass., have placed a No. 121 Richmond hot water heater in the residence of Mrs. A. A. Hines; also, in the school house on Thomas street they have placed a No. 421 Richmond steam heater.

E. W. Fisk, Mount Vernon, N. Y., has received the contract for overhauling the heating system and putting in a new heater in the Williamsburgh public school.

THE BOARD OF TRUSTEES of the University of Cincinnati, Ohio, will receive bids for work including the heating and ventilating plant for the main structure of the new university buildings until August 16.

THE REGENTS of the State University, Seattle, Wash, have let the contract for heating and ventilating the administration building of the new university to the Griffith Heating & Plumbing Company for \$4723.

THE TRUSTEES of the graded school, at Montpelier, Vt.. have decided on atesm heat for the building and have awarded the contract to L. C. Bagley, White River Junction, for \$1996.

THE CONTRACT for heating and ventilating the two ward and the Central School buildings at Benton Harbor, Mich., has been awarded to Edward Brammell of that place. The ward schools are to be heated by warm air and the Central School by steam.

THE NEW HAVEN HEATING & PLUMBING COMPANY, New Haven, Conn., have been awarded the contract for heating the new laboratory at the Sheffield Scientific School. Indirect steam will be the system employed.

WE UNDERSTAND that the S. H. Beard Heating & Plumbing Company, New Britain, Conn., have recently been awarded the contracts for heating three residences in that city, using hot water, steam and hot water combination, and ateam.

THE CHICAGO HEATING COMPANY, 40 North Clark street, Chicago, are to install hot water heating plants in the residence of Mrs. Julius Bauer, Fortyfourth street and Ellis avenue, and residence of James Gardner, Austin, Ill.

The following residences are to be provided with the New Idea smoke consuming furnaces by the Davis Johnson Company, 45 East Jackson street, Chicago: A. L. Perrote, Wheaton, Ill.; Robert Dickey, La Grange, Ill.; H. M. Small, Maywood, Ill.; S. S. Miles, Oak Park, Ill.; W. B. Gilbert, Austin, Ill.; Dr. F. J. Burr, Rogera Park, Ill.; M. E. Church, West Pullman, Ill.

THE MODEL HEATING COMPANY have contracts for placing five Novelty steam generators in fire and patrol houses in Philadelphia.

T. W. Cullen has been awarded the contract for plumbing the High School and Primary School House, Waltham, Mass., for \$733.

AT A SPECIAL SCHOOL MEETING, held at Manchester, N. II., July 16, it was decided to appropriate \$2800 to heat the school building in the village.

WOOD, BRIGHTMAN & Co., New Bedford, Mass., have been awarded the contract for the plumbing in the new St. Luke's Hospital, in that city.

FISHER BROS., Harrisburg, Pa., have been awarded the contract for heating the two new school buildings at Tower City for \$725.

The contract for plumbing J. S. Sanderson's new block, at the corner of Dwight and Sanford streets, Springfield, Mass., has been awarded to Edward S. Hanks, the Harrison avenue plumber.

W. ALLEN, Fargo, N. D., has closed the contract for plumbing the Gladstone Hotel, at Jamestown.

GEO. E. SLHEPBR & Co., Lynn, Mass., have been awarded the contract for the plumbing of the Phillips High School, at Swampscott, and have begun work on it. The gas piping in the building will be done by L. A. May, and the heating by Ingalls & Kendricken of Boston, who will put in two 48 inch tubular boilers. The contract for the slating and copper work was awarded to Burns & Bee.

#### An Iron Project in Utah.

Articles of incorporation have been filed with the county clerk for the Ogden Iron Mining & Manufacturing Company of Ogden, Utah.

The company own nine iron claims,

all in Weber mining district.

The incorporators are Albern Allen, Joseph Tyrrell, John Junker, C. S. Pulver, S. L. Ives, S. H. Head, Geo. F. Seager, C. A. Bedford, O. A. Kennedy, Maronl Poulter. L. E. Seager, James Wotherspoon, L. E. Bedford, J. C. Nye, E. G. Williams, E. F. Bratz, H. S. Seager, A. J. Weber and Geo. H. Burgitt, all of Ogden, Utah.

The officers of the company until the pextregular meeting of stockholders in

The officers of the company until the next regular meeting of stockholders in December are: Maroni Poulter, president; A. F. Bratz, vice-president; O. A. Kennedy, scorctary, and C. S. Pulver, treasurer, and with John Junker, Joseph Tyrrell and C. A. Bedford constitute the

board of directors.

The organization of this company is the result of an effort to consolidate all the desirable iron properties in the vicinity of Ogden under one management, for the purpose of development in the hope that such action may lead to staring up the old iron works which were once successfully operated in that city. By a united effort the owners, over 20 in number, of these properties hope to do what singly they could not expect to accomplish.

Two Northern Ohio inventors have, it is announced, just completed the plans of a new submarine vessel, designed primarily for work on sunken ships. They claim that the hoat can be submerged at a moment's notice, and that it can store sufficient air to conable its occupants to work under water without serious inconvenience for 12 to 24 hours.

The summary of immigration statistics for 11 nonths of the fiscal year, published by the Treasury Department, indicate that the decrease of immigration for the year will be about 50 per cent., as compared with that of last year; or about 300,000, as against 450,000 in 1893.

# THE RETAIL STORE.

#### The Berry Clothes Sprinkler.

This sprinkler is shown herewith and is put on the market by the Berry Sprinkler Company, Boston, Mass. The sprinkler fills automatically, absorbing the contents when placed in a bowl or basin of water. The manner in which it is used is obvious, a slight quick motion of the device precipitating some of its contents. The device is intended for use in connection with the ironing of clothes, permitting one to iron them immediately after sprinkling, if desired. For starched clothes its use is referred to as especially satisfactory. It may also be used as a sprinkler for

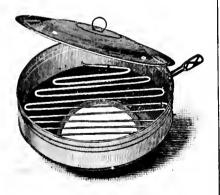

The Berry Clothes Sprinkler.

house plants and for laying the dust while aweeping. It can also be utilized in the sick room where liquid disinfectant is employed, and it is stated that it is now being used for that purpose in some hospitals.

#### The Lebanon Broiler.

Seltzer Specialty Company, Lebanon, Pa., are manufacturing this article, of which an illustration is given herewith. The broilers are described as made of best bright tin, with sheet steel bottoms. The bottoms are tapered so that drippings will not grease the stove. The broilers are large enough to take in rossting ears, chicken, fish, &c., and

The Lebanon Broiler.

may be successfully used for roasting potatoes, apples, & 2, over the fire. The broiler is also referred to as making an excellent steam cooker, for which purpose it is placed over a kettle of boiling water. In this way puddings, dumplings, vegetables, & 2, may be cooked in it. The broilers are 11 inches in diameter and 3½ inches deep.

# Starting and Conducting Business.

BY M. STRANSKY.

In many cities of the United States certain particular methods have been adopted in building up vast mercantile establishments. The greatest successes, commercially, have been in the retail dry goods line—the department stores; but the means used can be applied to a general house furnishing store, under which designation a Hardware, Stove and Tinware dealer may properly be classed. A. T. Stewart was, perhaps, the first merchant in this country who attained great prominence by using many of the systems in vogue in every well organized department store of the present day. It is true that some of his well tried principles were originated by himself: but it is equally true that many business ideas, which he is sometimes credited with having created, had been practiced long before in the mammoth Old World establishments, such as the Bon Marché and Louvre of Paris, Whiteley's in London, &c.

In New York City and other Eastern cities competing merchants observed Stewart's amazing growth and gradually adopted some of his ideas, each successful competitor adding such other schemes for attracting custom as suggested themselves in the conduct of his own particular business. With the development of Southern and Western business centers (especially the latter) the methods so successfully practiced in the East were transplanted. It may be urged that the processes which have proven valuable in the branch of tradereferred to may not be feasible in the house furnishing line. There is no doubt, however, that they are, and I shall endeavor to mark out a plan of campaign for a Hardware dealer, with the utmost confidence that if substantially adopted it will most certainly lead to prosperity. Many of the ideas here announced are those successfully used heretofore, while others are new.

#### NEVER MIND THE RENT.

The most important requisite to success in the retail business is location. Numberless merchants, attracted by an imposing building, at perhaps a low rent, in an out-of-the way street, have made the fatal mistake of preferring such a building to a more modest looking one in a prominent thoroughfare. To get the full benefit of the modern methods you must be located in the best street in the city. Never mind the rent! Location is everything. And now, having opened our store on a lively thoroughfare, let us proceed to business. Let us imagine an ambitious merchant with a stock of, say, \$5000 in a fair sized town anywhere within ten days from New York or Chicago—that is to say, a point where it takes ten days or so for freight to reach him.

#### SHOW WINDOW DRESSING.

Next in importance to location is the show window. Show window dressing is the most important advertising. The goods in a show window should be changed at least twice a week and

often three times. There should be a window full of some good special sale article once or twice a week. Never let up on this in season or out of season. The best judgment must be used in selecting these special sale goods. Do not advertise through your show window an article the chief merit of which is cheapness. Be content often to make a very small profit on such articles; sometimes sell them at cost and occasionally sell them at less than cost.

#### BROOM SALE.

For example, suppose you decide to have a special sale on brooms. Ordinarily you might sell, say, a dozen brooms in a week. But for this special sale do not hesitate to order 25 dozen brooms. Now you can buy in lots like that brooms ranging from \$1.25 a dozen to \$2.50 dozen. If you buy them for \$1.25 and sell them for, say, 12 cents each, you will be giving your enstomers a bargain, but not a good broom. The broom will not give satisfaction and your customers, forgetting that they paid only 12 cents, will say "Oh, he keeps nothing but trash!" It will be a waste of time and energy. On the other hand, suppose you pay \$1.75 for the brooms. It is presumed that your special sale on brooms is at a time when the broom corn crop is good and brooms are cheap, so that you can buy a fairly nice three sewed broom for \$1.75 a dozen. Suppose you sell them at 15 cents each. You will lose about 2 cents on each broom, but a large proportion of your customers will buy then and there other goods on which you will make the regular profit: many of them will talk to their relatives, friends and neighbors about your store, will show the broom they bought and will be sure to go to your store when next they require anything in your line.

You should advertise this broom

You should advertise this broom sale like this: On a Monday put in your show window the whole 25 dozen brooms and nothing else. Hang them around the back, sides and front, and pile a lot of them in the middle of the window with a large ticket reading

SPECIAL SALE.
Beginning Thursday,
25 dozen 3 String
Extra Quality
BROOMS,

EACH.

When Thursday comes take the whole 25 dozen out of the window and place them in a rear part of the store, so that your customers will have a chance to see and buy other goods. If you hand the brooms out from the show window or place them too near the door, many will buy the brooms and nothing else and pass out. But even in such cases you will, in the near future, get the benefit of the advertising by an increase of patronage. You will find that if you give extra value, shrewd housekeepers will wish to buy three, four or six brooms at a time. Even competitors will try indirectly to buy up your brooms. Your plan should be to first stamp, with a rubber stamp, your name and address on the handle of each broom and then limit the buyers to one or two brooms—telling them plainly that this is a special lot and you wish to give all your customers the benefit of the purchase; besides you must limit the

number to each in order to prevent your competitors from buying them to the exclusion of your customers.

#### SOME SEASONABLE ARTICLE.

On Thursday, when you have emptied your show window, you must be prepared with another lot of goods, say Chamber Pails, or Japanned Bread Boxes, or some seasonable article, Fly Screens, or lee Cream Freezers, or Oil or Gas Stoves, or Coal Hods or Enameled Preserving Kettles. There are a thousand and one things suitable to this purpose. But avoid "running on" a petty article, such as a 4-cent Shovel or a 3-cent Tack Hammer, unless you have a dozen or so of such articles at the same time, as special sale leaders. But do not, under any circumstances, sell a poor article at a special sale, not even at 1 cent. If you wish, by way of variety, to sometimes run on things at from, say, 3 to 9 cents, there are plenty of good quality articles even at such trifling prices—Tacks, Coal Shovels, Pokers, Stamped Pans, Pie Plates, Door Bolts and numberless things to select from in Hardware, wooden ware, tinware and miscellaneous knick-knacks. It is a good plan, whenever advertising either through show windows or newspapers or circulars, to put a tag on one of each of the advertised articles reading:

#### SAMPLE NOT TO BE SOLD.

This is done so that in the event of your having a great rush for the advertised articles you can have one left to show belated purchasers. Tell them to show belated purchasers. Tell them you have had an extraordinary rush for the goods, show them the sample, take their names and addresses and promise to order more, and to deliver to every one who calls in answer to your advertisement. In other words, you must make good every announcement at whatever cost; for nothing harms a merchant so much as to break faith with the public. It is not necessary, in order to attract custom by window advertising, to have a window full of one article. At times a general assortment of goods may be displayed, and one or a few articles may be marked at a reduced price. If a merchant has more than one show window he has a great advantage, inasmuch as he can display the regular lines of goods at all times, while reserving one window for special sales in steady and rapid succession. The greater part of show window dressing can be done on variously shaped forms, can be done on variously snaped forms, which may be trimmed in the store and placed in the window ready dressed. There is limitless scope for this, and there should be constant study for striking effects.

#### A PLEASED CUSTOMER.

There is no objection to having, say once a week, a special sale for one day only on a lot of some desirable articles, with a suitable price ticket hanging over it. This sale need not be advertised in any other way except by the ticket announcement inside of your store. Customers who happen to be in the store will come unexpectedly upon the bargain, will buy, and will consider themselves fortunate in having visited your store that day. They will leave pleased; and a pleased customer talks in your favor. Moreover, they will call again and again on other days in the hope of securing more of your

#### TO-DAY ONLY

specialties. Thus the public will gradually fall into the habit of visiting your store without having been attracted by newspaper announcement or show window display. Moreover, your competitors will not be posted as to what you are offering. But be sure you have your offerings for one day

only, if you have so announced. You can next day put the goods back in stock at the regular selling price. Occasionally, it is advisable to have a lively sale even for one hour only. All this creates stir, activity and favorable comment, and helps to build up a business. Make it a rule, and announce by placards, that customers are welcome to look around whether they purchase or not. Instruct your salesmen not to importune visitors to buy, so that they will be perfectly at ease in looking around. But your salesmen must be alert and must watch the expressions on the faces of visitors so as to be ready to answer any inquiries, otherwise there will be some complaint of inattention.

#### METHODS OF ADVERTISING.

As we have been considering the value of show windows from the standpoint of advertising, it may be well to next consider the general subject of advertising before taking up the matter of considering affairs inside of the store. It is undeniable that more money is wasted in advertising by the inexperienced than on any other thing in business. We hear and read so often of the value of printed matter or newspaper advertising, or of the vast establishments founded by advertising, that many merchants are tempted to try that supposed way to success. As a general thing most of the money thus spent is wasted—at least there is not sufficient return for the outlay. A merchant with a stock of, say, \$5000 ought to do a business of \$15,000 to \$30,000 a year—depending on how near he is to the market. Let us say he sells in 1893 \$22,000. He should decide to spend 3 per cent, for advertising in 1894, which would be \$660. This amount would be most advantageously spent if divided about as follows:

 On show window leaders
 \$500.00

 On newspapers
 100.00

 On circulars
 60.00

The best method of show window advertising has been described. As to newspapers, it requires special talent to advertise profitably. Never advertise like this:

tise like this:

The best place in town to buy Hardware, House Furnishing Goods, &c., is at John Smith's, 100 Main street. We have the best assortment at prices that

defy competition.

Instead of this ancient and comfortable, but worn out way, adopt a more striking method. Mention some special articles, describe them concisely, use cuts whenever possible, and above all quote prices. For example:

#### SPECIAL SALE.

Galvanized Conl Itods, a nice size, corrugated bottom, worth 50 cents,

25 dozen Willow Clothes Baskets, extra strong, medium size, first quality in every respect,

Your newspaper announcement must never appear the same way twice in succession. At times you can vary the style, thus:

#### OH, MY!

A Lawo Mower like that for \$3. Tois is heard daily in our Store from our delighted customers. Come and look at the Mowers.

Then follow with three or four other items, avoiding long winded announcements. Advertise only excellent values, and remember that this is a busy world. People have no time to read elaborately worded advertisements, and cannot remember what they read if you say too much. "Brevity is the soul of wit and the life of advertising."

In determining the outlay for news-

paper advertising the amount is based on a stock and sales as stated. As the business grows the proportion may be increased in favor of newspaper advertising. When the business becomes large, with the stock of merchandise correspondingly large, more than half of the total amount set aside for advertising may profitably be devoted to newspaper aunouncements. But window advertising must never be neglected and must be persisted it no matter what dimensions the business attains.

#### WITHOUT ANY RESULT.

Circular advertising has the disadvantage that it takes too long to get the matter from the printer and have it properly distributed. To give the circulars away on the street is not only a source of annoyance to passers by but is a positive waste, since nine out of ten are thrown away without being read, and the tenth one is read out of enriosity and then thrown away without any result. It may be well to do some circular advertising, but they must be distributed from house to house by the most reliable boy you have in your employ. Nine out of ten boys whom you hire temporarily to give out circulars will start out bravely with an armful, work faithfully for an hour and then throw the remainder over a fence, down a sewer or make a bonfire with them. The announcements on your circulars must also not be of the defy competition order, but must have a striking heading like this:

#### SNOW IN JULY

would be a surprise, but not more than those real copper bottom Wash Boilers for No 7 Stoves at 79 cents.

The idea of fixing odd selling prices, 9 cents, 24 cents, 49 cents, 74 cents, 98 cents, \$1.98, &c., is agood one. It sounds cheaper and seems cheaper. Just observe how a lady in looking through a line of goods will ask the price of, say, a Bird Cage. You state the price, say, \$1.98. She looks at other cages, and, presently, coming back to the first one, she will say: "How much is this—\$1 and—?" The \$1 seems to have been impressed on her mind, and she thinks the article is much less than \$2.

And now as to the general conduct of the business. Have one price only. Place placards in conspicuous places, reading:

One price—a fair one. One price—No deviation.

It is necessary to gain the confidence of buyers by having absolutely one price, and by having all your selling prices marked in plain figures. This is a saving of time and increases sales. Oftentimes customers will buy goods when they are boldly marked ont. The price attracts: many do not care to ask questions but will buy when they see the articles offered that way. A large price ticket is a silent salesman.

#### LIABLE TO BE STOLEN.

A matter of extreme importance is the general arrangement of fixtures. Have as few goods on shelves as possible. Put your goods out on connters. All the small articles. Hammers, Locks, Tacks, Spoons, Cutlery and a thousand other things, should be displayed in snug fitting bins, each bin with a price ticket on it. You will be surprised how those little bins will attract customers. Have plenty of goods on counters and center tables, with tickets everywhere. Change around often. Have a line of goods one week in a given place and then change to a different part of the store. Have your shelves for such goods as are seldom called for, or for the finest and highest priced goods. For instance, if you have single plated Tea and Table

Spoons in your bins, keep the high priced triple plated Spoons on shelvesor in a showcase. Get along, by the way, mashoweases, treating, by the way, with few showeases; one showeases in fact, is sufficient. Showeases are out of date, It may be necessary to have one, but that is surely sufficient. Do not fear that goods exposed on counters are liable to be stolen. Though this may happen occasionally, it is made up 20 times over by increased sales. Make it a rule to cheerfully refund the money if any article bought proves un-satisfactory. Do not insist on exchanging or selling something else in place of the goods brought back, but refund the money promptly. In nearly every instance the customer will buy something else amounting to as much or more. Have placards also prominently posted up reading:

If anything does not suit, bring it

back and get your money.

Money refunded if any purchase proves unsatisfactory.

We don't want your money unless you are satisfied.

Merchants who never make mistakes never make anything. Mistakes of overbuying or of buying slow selling goods—" stickers" they are called—will frequently be made. In such cases the first loss is the best loss. If goods will not move at one price, reduce the price. If after a few days they still stick, reduce again. Keep reducing until you get rid of them. Sometimes until you get rid of them. Sometimes even a deep cut in price will not avail. In that event put a premium on the goods—a "P. M." it is called. That is to say, give your salesmen 5 to 10 per cent.—according to the necessity of the case—on all the stickers they sell. At times, if reduced price will not succeed put the price back again and give "P. M." instead. All goods on which a "P. M." is given should have a separate tag with the amount of the "P. M." noted thereon. When such goods are sold the article with the tag should be brought to you, so that you can put to say, give your salesmen 5 to 10 per be brought to you, so that you can put your initials on the tag. The latter is ne prought to you, so that you can put your mitials on the tag. The latter is then retained by the salesman and cashed, say, once a week. Unless some system of this kind is adopted, you will find that the "P. M." tags will sometimes be surreptitiously transferred to quick selling goods, and you will thus have paying a premium, for selling your. he paying a premium for selling regu-

#### SEE HOW QUICKLY.

If it is necessary to deliver goods to customers, make it a strong point to deliver promptly. If you deliver by boys offer, besides nominal wages, say or 2 cents for each delivery. You will be surprised to see how quickly the boys will return and how eager they will be for more deliveries. Don't find too much fault with your help. Do not confine all your pleasant words to your customers. If a salesman does well, or keeps stock in good order, or dresses a good window, show your appreciation by encouraging words.

#### BE FAIR.

Let it be an unvarying rule to treat traveling salesmen cordially. They are well posted as to prices and can give you valuable suggestions at times. In your dealings with the inerchants from whom you buy be fair in every way. Pay promptly and make as few claims as possible. Even if you have a fair claim, if the matter is trilling. let it pass without making any claim. Success in business is due to the good will not only of buyers but also of sellers. Avoid discussing politics and attend strictly to business. If possible go once a year or so to the market. Visit other retail establishments. You will thus obtain suggestions which may be utilized. Divide the keeping of the stock among all your clerks—that is to say, give each clerk a certain part of the stock to look after, to keep it

clean, to notify you of goods wanted in order to keep up the assortment, or to advise you of such goods as are moving slowly.

#### CONSPICUOUS SUCCESSES.

It may be urged that the general otherwise to a depend on the general plan of conducting business as here outlined may be very well for a dry goods store, but is not adapted to a Hardware store and House Furnishing establishment. But this is a mistake, The same methods which prevail in the branch where the most conspicuous successes have been made will build np a Hardware or House Furnishing business, Indeed, they have done so everywhere.

#### IT IS EASY TO ADD.

It should be the ambition of the retail Hardwareman to build up a business in which may be bought almost every thing. When the Hardware, Stove and House Furnishing departments are in good running order, it is an easy mat-ter to add, say crockery, china, glass ware and bric-a-brac. Then as additional space is obtained, pictures and ditional space is obtained, pictures and frames, wall paper, upholstery, furniture and carpets may gradually be added—in fact everything pertaining to the interior of a home may legitimately be sold under one roof. It should not be forgotten, however, that we like a paided under the care no line must be added unless the assortment is quite complete. Hence, if there is insufficient capital for the purpose it is preferable to wait until you are financially able to properly open each new department.

#### A CERTAIN INVESTMENT.

In this way the Hardware, Stove and House Furnishing store may develop into a department store of kindred lines-each branch conducted on its own merits, and the accounts kept as though each were a separate business, so that the profits or losses of each department may be accurately ascertained twice each year. A competent head must, of course, be engaged for each important line. The usual way is to make a certain investment for stock in a given department. After that subsequent weekly purchases are regulated by the weekly sales, and thus perfect control is maintained over the buying. A good office man or finau-cier can hold the buyer or manager of each department in perfect check, and can tell quite accurately just how each separate department stands at the end

of each week.

It may confidently be asserted that
the growth of many large and successful establishments all over the United States is due to the conduct of business on the general lines briefly mentioned. At any rate, it is an easy matter for ambitious readers to ex-periment with some of the ideas advanced.

#### Buhl Side Lift Lanterns.

Buhl Stamping Company, Detroit, Mich., are putting on the market the lanterns represented in the accompany. ing illustrations, which are a recent addition to their line. By the use of the thumb and forefinger in the manner indicated in Fig. 1, the disk, guard and globe may be lifted entirely free from the burner and as readily returned to It is pointed out that the patent place. side lift securely locks the globe in position when raised or lowered, and that the burner is always locked when the lantern is in use. Fig. 2 represents the company's side lift contractor's lantern, which is offered with ruby globe, and which on account of its atrong construction, simplicity and few separable parts is specially recommended for street

and railroad purposes, or wherever a signal lantern is required. These lanterns are equipped with the company's braced souare tubes, made from a single piece

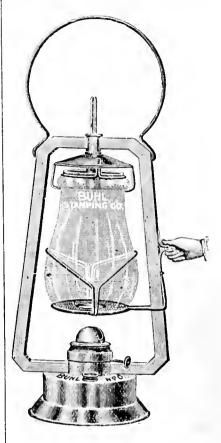

Fig. 1.-Buhl Side Lift Lantern No. 15.

of tin, non detachable basket guard and tested oil well. The latter, it is stated, can be filled, lighted and regulated without removing the globe. It is

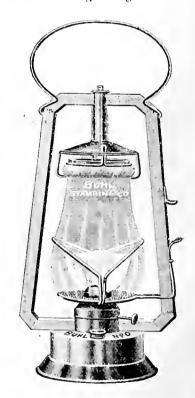

Fig. 2.—No. 159 Contractors' Lantern.

claimed that these lanterns will burn 20 hours without refilling, and that they can be easily manipulated by a child or a one armed man.

# STOVE TRADE NOTES.

## Concerning Prices of Stoves.

RY W. J. M.

! Considering the stagnation of the stove business for the past eight or nine months, prices have been fairly well maintained. The tendency is strong to force sales at any price when repeated efforts to get orders from good customers have been fruitless. The temporary loss of a dealer's trade is not so much the cause of reduction in prices as the fcar on the part of salesmen that some favorable change might take place with their customer's business during their absence, and some fortunate fellow drummer be on the ground to get his order and secure a steady customer. Some cutting has been done and in some cases dealers have made prices for the wholesalers, but very little mischief in this direction has been done, and when the tide of business turns manu. facturers will reap the benefit, well deserved, of the wisdom displayed in holding prices. It indicates very forcibly that prices of stoves has been ruling low enough before the advent of hard times, and any general reduction of prices would have thrown many concerns into bankruptcy. There has been more shaving or cutting of price of contract work for new buildings than in any other direction, but in the general line steadiness of prices has prevailed.

The fall season, however, is now about at hand. At this time last year one and all (as if by common accord) were disposed to apply the brake to their business and sell their customers what they appeared reasonably to require, but to force no goods upon them and honor countermands as they were made without complaint or protest. This policy was followed on the principle that, while the business of the country was in the throes of a panic, forced sales were apt to swell losses, and credits as liberally bestowed as before would be regretted at the end of

the year.

There is danger now, however, that this wisdom will forsake some manufacturers who have the impression that the weaklings have gone under and most all the aurvivors are safe risks. Over zealous competition or cutting of prices to gain customers based on that impression will result disastrously to those who undertake it, and all will

auffer indirectly.

The grounds upon which sellers find apparent justification for cutting prices are legion, and among the more recent excuses is the plea that the sacrifice of profit to secure a new customer, if he be a prominent dealer and large buyer, can be reasonably charged to advertising account. The idea that it costs a certain amount to secure a new customer by advertising, and if the salesman cannot effect a sale to a new man by force of argument or the merits of his goods he can afford to cut them to accomplish it, charging the difference to advertising, is a false and expensive one. Goods that have merit and are persistently and judiciously advertised command a ready sale at a fair price, while cutting is bound to react upon the manufacturer

and compel reductions to other customers who have paid regular prices. Besides this, there are some dealers who buy only at such sacrifice prices, and as a rule are not steadfast or profitable customers to have. Sales like the following are sometimes under

ing are sometimes made:

"A" is a large dealer and will give the salesman an order for 50 of his ranges and run them right along, providing he can buy them at \$10 each. The regular price is \$12 50. The net foundry cost of them is \$9. It wants a new name plate for it and his own name card put on. He atipulates that they must be delivered to his town and he be guaranteed against breakage. These provisions are against the policy of the house, but this is an exceptioual case and agreed to to get Mr. A's trade. The terms are four months net, but Mr. A always having plenty of ready money, pays the account in 30 days and takes 5 per cent. off, although the possibility of his doing so was not referred to when the deal was made, and the house, after some little hesitation, concludes to allow it this time. The account, when such a deal is closed, would stand something like this:

Received for 50 ranges at \$10 each	\$500.00
Less 5 per cent. discount	25.00
Total	\$475.00
Cost of ranges	\$450.00
Pattern work for name and card	7.50
50 cards at 10 cents each	5.00
Cartage	10.00
Freight prepaid	20.00
Freight prepaid	5.00
Salesman's expenses	7.50

Total cost......\$595.00

This does not include handling, elevator power, clerk hire or any of the items which go to make the general expense which all sales should help to pay, amounting at least to 10 per cent. on the cost, or \$45 more, that and the \$30 going to advertising account. Surely this is expensive advertising unless the same dealer bought a good many other atoves from the same house, and paid fair prices for them, which so shrewd a man would not be apt to do, and if he did not it would be hard to find what advertising the \$75 paid for when the ranges bought were differently named and the identification of the manufacturer obscured.

#### The Comstock-Castle Stove Company

of Quincy, Ill., send us a copy of their forty-sixth annual catalogue and pricelist of stoves, ranges and hollow ware which they manufacture. In presenting this volume to the trade the company call attention to the number of additions which have been made to their already extensive assortment of cook stoves and heaters, including a line of hand-some steel ranges. The opening pages are given up to information of general interest to the trade, together with an alphabetical index. The ranges occupy about 30 pages of the catalogue, the constructions being known under such names as the Economy, New Best, Prize, Noxol, Magic Argand and Em-

pire. The following 30 pages are taken up with cook stoves known as the Prize Economy, Golden Economy, Champion, Ardmore, Stately, Sunrise, Mascot and Alpine. The second half of the work is devoted to heaters, the leading place being given to the Economy Todd, a wood base burner made in numerous combinations. Since introducing this class of stoves to the trade, the manufacturers state that they have tried to keep abreast of the times and improvements and have patented the more important features introduced. Special attention is invited to the Economy all cast Todd stove, in which two cover holes and a center are introduced in the top. This enables it to be used for both heating and cooking purposes. The Antique Oak, introduced late in the season of 1889-90 and which has met with a gratifying success; the Grand, a sheet iron cylinder surface burner; the Benjamin Franklin, for hard or soft coal; the Economy, a soft coal base heater, and a miscellaneous line of cottage parlor, globe, cannon and box stoves complete the assortment. Several pages are given up to a list of stoves for which repairs can be furnished. The stoves out of date for which repairs only are made are indicated in the list, as well as those stoves of which the patterns for some of the parts have been destroyed by fire.

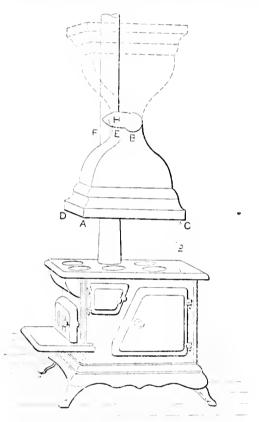

# The Gem City Stove Company.

Among the neatly printed and carefully arranged stove catalogues which have reached our deak this season, that issued by the Gem City Stove Company of Dayton, Ohio, takes a leading position. It is a volume of a little over 90 pages, bound in covers carrying an em. bossed side title in deep blue, the back cover being embellished with a bird's eye view of the company's works at Dayton. The printing is in two colors, and the text is presented in clear cut type upon a good quality of paper.
The leading place is given to the Clermont line of ranges and cook stoves, which are manufactured in 114 different styles and sizes. The constructive features are such as have established for the goods a wide popularity and the ornamentation is of an attractive character. The cook atoves and ranges occupy over 60 pages of the catalogue, the remaining portion being given up to heaters, of which the Dayton Oak for wood or coal is the first considered.
This heater has square ash box, large double fire doors, extra heavy ribbed fire pot, swing top with griddle hole beneath, deep ash pit with large bailed ash pan and nickel trimmings. The asn pan and nicket triminings. The Cottage Gem, for hard or soft coal or coke, made in two sizes; the Adora, a fancy soft coal parlor stove made in three sizes; the Rulo, a heavy cannon stove made in four sizes; the Comfort, a new square parlor heater for soft coal or coke, made in three sizes; the Wood-bine, a richly treated cottage parlor stove for wood; the Oakland, a new box atove, and the Pearl, an open front heater for coal or wood, are also illustrated and described.

#### Revolving Range Canopy.

A. L. Burtis, Lockport, N. Y., has designed a revolving range canopy that possesses a number of original features. A B C D E represents the canopy in position over the range. The smoke pipe F is provided with a tee, II, over which the canopy slips. There is an oblong opening in the underside of the tee, through which the vapors from the lange are conveyed to the smoke pipe and thence up the chimney. As the canopy slips on the tee II, it can be removed at any time, or its position reversed, as indicated by the dotted lines. When the canopy is in a reversed position the opening in underside of tee is closed, thus preventing any air from entering the smoke plpe at that point.

upper part of the drum by three independent steel flues, which are all inclosed in the easing. Several pages at the beginning of the catalogue are devoted to remarks upon warm air furnaces, fresh air supply and the aubject of ventilation. The Famous Florida, Famous Eclipse and Famous Comet furnaces are illustrated and described, together with the Famous Magnet, already mentioned. Following these goods are "a few pointers on setting a furnace," and a statement "why furnaces supersede heating stoves." A blank form of specification for warm air heating apparatus is given, together with the company's inquiry sheet. Instructions for setting up furnaces in portable form and in brick work are given, together with telegraphic code, tables

Revolving Range Canopy.

The distance from C to the top of range should be about 16 inches, or sufficient to allow the canopy to revolve without coming in contact with the range.

# The McClary Mfg. Company, Limited,

of Lendor, Ontario, and with branches in Toronto, Montreal, Winnipeg and Vancouver, B. C., have issued from the press an 80 page illustrated and descriptive catalogue of McClary's warm air furnaces and combination warm air and hot water heaters, adapted to warm churches, residences, hotels, public buildings, &c. For the season of 1894 the company have added several new features to their already extensive assortment. The Famous Magnet wood furnace, which was placed upon the market last year, has been improved by adding to its radiating capacity, and the company have also added a larger size known as No. 17. They have also improved their low radiator steel coal furnace now known as the Famous Florida. Its heating capacity has been increased materially by lowering and enlarging the radiator and connecting it to the

showing capacity of pipes and registers, testimonials, &c.

#### Gold Coin Stoves,

We have before us a 152-page catalogue of Gold Coin stoves manufactured in the West by the Chicago Stove Works of Chicago, Ill. It will be re-membered that in last week's issue of the paper we reviewed the catalogue of the Bussey & McLeod Stove Company of Troy, N. Y., who are Eastern makers of these goods The volume before us is very similar in its make-up and arrangement to that of the latter company, and an extended review of it would practically consist of a repetition of what was presented last week. The goods shown include a number of new patterns, together with others which have been improved in various particulars for the season of 1894. Among the latest additions to the company's assortment may be mentioned the Gold Coin range for hard or soft coal, a feature of the exterior treatment being carved ornamentation, which produces a pleasing effect. The edges are oil buffed and the oven door panel, oven door shelf,

towel rail and tea pot stand are nickel plated. The stove has sectional fireback, curved front grate, flat or duplex bottom grates, heavy ring covers and centerpieces, strapped and ventilated. The company have also added a fourhole range to their line of Gold Coin stoves and have improved their Gold Coin square base heater for wood, made in two sizes; the Gold Coin Ventiduct wood parlor, the Gold Coin Ventiduct oak, and the Gold Coin Ventiduct base burner for hard coal. The printing is neatly done and the binding is in red covers with embossed side title in old gold.

#### Channon-Emery Stove Company

of Quincy, Ill., send us a copy of their annual catalogue and price-list of stoves, ranges and hollow ware. It is of a size and shape convenient for reference, neatly printed and arranged and bound in attractive covers with back title consisting of the name and address of the company and the dates 1894-95. The line of goods shown are made under the name Never Fail, the ranges occupying something like 40 pages of the catalogue. The leading features are interchangeable reservoir system, ample sheet flues, curved front grate, large feed door, heavy covers, capacious ash pan, large and high oven, fire box warranted for five years, cut top and attractive ornamentation. These goods are made for coal or wood and also for wood exclusively. The cook stoves occupy over 30 pages and embody features of construction and ornamentation which have given them an extensive sale. heaters are represented with the Cheerful Todd for 1894 in the leading place. This is a new stove for wood only, and is offered in a variety of styles and sizes, several of which are shown. Cheerful Oak, Cheerful Surface Burner, Expert, Primrese, Warrior, Senator, Firefly, Oak Leaf, Useful, Sunlight, Fairy, Leader, Western and Motto are some of the names under which the other heaters are offered. The catalogue closes with a list of hollow ware and an alphabetically arranged index.

### J. S. & M. Peckham Company

of Utica, N. Y., are distributing to the trade their illustrated catalogue and price-list of stoves, ranges and stove dealers' supplies which they manufacture. The goods noted at the beginning are the Imperial Grand ranges for hard or soft cosl or wood, made in various styles and sizes. This is followed by the Grand Army, the Grand Electric, Belfast Grand and Liberty Grand. A page with two illustrations shows the high closet and the fancy mantel which can be attached to any size or style of range made by the Peckham Company. The Saxon Grand is a coal and wood cook with bracket reservoir. Next comes the World Grand and the Artisan Grand, a wood cook; the Justice Grand and the Grand Duke, both of which are adapted for wood. The heating stoves comprise the Niagara Grand, Windsor Grand, Grand Globe, Citizen Grand and a variety of smaller heaters. The Cottage Grand, which has been improved for 1894, is a direct draft heating stove for wood, made in two sizes. The Cherry, Palace, Rosedale and New York are other members of this general class. The remainder of the catalogue is devoted to stove dealers' supplies, all the goods being illustrated and accompanied by lists of prices and sizes.

#### ODD PLATES.

The Peninsular Stove Company, Detroit, Micb., are distributing an interesting publication showing cuts and presenting a description of their complete line of Peninsular furnaces adapted for using all kinds of fuel. This work contains a great deal of valuable information about furnaces and furnace work in general, and Peninsular furnaces in particular. A copy of the ironclad Peninsular guarantee is given on one of the pages, while numerous others are devoted to the names of some of the thousands of persons using Peninsular furnaces in various sections of the country.

The Plant of the Mount Penn Stove Works, Reading, Pa., was put into operation on Thursday after a lengthy idleness, with over 100 men.

The Preserry Stove Lining Company of Taunton, Mass., have issued a supplement to their catalogue of stove, range and furnace linings. It consists of 16 pages and presents the names of the stoves arranged in alphabetical order. In many cases the name of the manufacturer of the stove is given, together with the sizes for which the linings can be supplied. The binding of the pamphlet is in light eream colored covers with side title in black.

THE SPRINGFIELD STOVE WORKS OF Springfield, Mo., have been enjoying a good trade and have built up a business which has been exceedingly gratifying to the parent company of Cleveland. They obtain their pig from Alabama, their coke from Pennsylvania and their coal from Kansas. We understand that they give employment to about 100 hands when running full, and dispose of their product in Missouri, Arkansas, Texas, Arizona, Kansas, Nebraska, Utah, New Mexico, and have also made shipments to Iowa, Minnesota and Illinois.

THE TROY NICKEL WORKS, Troy, N. Y., are distributing to their friends in the trade a little pamphlet of a size convenient to carry in the vest pocket and bound in colored paper covers. It is entitled "The Hands," and its pages tell how to keep them white and clean and free from burns. The first way, it is told, is to insist on having Alaska trimmings on your stove. In the sec-ond place, one will need an Alaska lifter, poker and shovel. Third, when the cake is burning and there is no time to look for the cloth, you will not ourn your fingers if you have an Alaska knob on the oven door. The fourth statement is to the effect that the Alaska trimmings are nicely nickel plated and will not soil the fingers. The moral is, to use only Alaska trimmings if one would keep the hands white and free from burns. A celendar for the month of August occupies the last page of the little pamphlet.

"The Economy Heaters" is the title of a 32-page pamphlet which reaches us from the J. F. Pease Furnace Company, Syracuse, N. Y. The text illustrates and describes the Economy patent warm air furnaces, patented by John F. Pease and manufactured by the company named. The features of construction are covered in such a way as to enable the dealer to readily understand the arrangement of parts and operation of the heaters, while tables presented in connection with the illustrations show the various sizes in which the goods are made, their weight, dimensions and capacities. There are also given a number of letters from some of

those who have used the company's goods. These are taken from the pamphlet entitled "Opinions and References," a copy of which, we understand, will be mailed to any address on application.

Wood, Bishop & Co., 41-42 West Market Square, Bangor, Maine, favor us with a copy of a 32-page paniphlet descriptive of the Monitor and Climax wood furnaces, which they manufacture in several sizes. The Monitor is made in portable form and also for brick setting, being designed to meet the requirements for a simple, heavy, durable and powerful heater. The fire box is of corrugated cast iron, the drum of heavy plate iron and the radiator of heavy sheet fron, the latter being an important feature of construction. Climax wood furnace has been brought out to meet the demand for a low priced construction. This has a heavy corrugated cast iron fire box, the same as that used in the Monitor wood furnace. The radiator is also of cast iron, the feed door is extra large, and when so ordered is furnished with an apparatus for regulating the furnace from the rooms above. A portion of the pamphlet is given up to testimonial letters from some of those who have used the heaters of the company.

The Mt. Penn Stove Works, Reading, Pa., are sending out circulars illustrating their new goods. In ranges they show the Penn Item, a low priced aix hole range, cut top, duplex or plain flat grate, and with or without reservoir; and the Penn City, a low priced solid end hearth range, six holes, cut top, bailed ash pan, duplex or plain flat grate, and with or without reservoir. In heating goods they describe the Penn Coin, a straight draft surface burner; the Penn Pride, a surface burner with half revertible flue; the Penn Pearl, a surface burner with full revertible flue. The heating stoves all have large sliding feed doors, with fire brick linings extending above the doors. Extra deep ash pits with large ash pans, and shaking center discharge grates with poke holes, and are surmounted by handsome spun urns.

"Hot Water Heaters and Warm Air Furnaces" is the title of a pamphlet issued by the Peninsular Stove Company, Detroit. The inside title page is given up to the announcement that a written guarantee accompanies every Peninsular furnace. The illustrations in the publication show the Peninsular patent duplex grate, the Peninsular hot water and warm air combination, the Peninsular furnace, the Famous Peninsular, the Radiant Peninsular, the Carbon Peninsular and the Peninsular wood furnace. In addition to these illustrations there is presented a long list of references and many testimonial letters.

ISAAC A. SHEPPARD & Co. of Philadelphia have issued a four-page circular descriptive of their Paragon steel plate furnace. Round and octagon base furnaces are the subjects of illustrations of large size, the interiors being por-trayed in section. The round base fur-nace is described as being made in six sizes, with curved cylinder and frictionless draw center grate and heavy sheet steel drums, and the octagon base fur nace is stated to be adapted to three different arrangements of grates and cylinders. The Paragon furnaces are made on the three-drum principle, and the makers claim for them the following advantages: That the inner and outer combustion chambers communicate with each other in such a way that all the radiating surfaces of both chambers are equally heated; that both combustion chambers are absolutely self-cleaning, and that both upper and lower radiator eastings are made in one piece, and there are no joints between east iron surfaces above the fire pot level. The circular contains a few testimonials received from one customer, space not allowing of the use of more, and, in the words of the manufacturer, published as "a straw to show which way the wind blows."

The Ringen Stove Company, St. Louis, Mo., who are well known as manufacturers of the Quick Meal gas and gasoline stoves, have now added to their line an oil heating stove known as the Electric. This stove will be made in four styles and sizes. A small catalogue is now in course of preparation, illustrating and describing these goods, which will shortly be mailed to the trade.

THE SMITH & ANTHONY COMPANY, Boston, report a good demand for the Royal Hub and Queen Hub ranges, which they claim possess all the features necessary for a perfect cooking apparatus. They also refer to their Hub Royal square heater, which is already favorably known to the trade. This stove is said to possess many excellent features. It is of the revertible flue type and has a space between the fire box and the diving flue, at either side, communicating with an opening at the bottom of the stove through which the cold air is taken from the floor, heated and dis-charged at the front and back of the The magazine is titted with a stove. cover that closes on an asbestos seat, and which is secured by a tightening latch, rendering the admission of air into the top of the magazine impossible and preventing combustion. The grate is so arranged as to force the air entering to strike the center of the fire and thoroughly mix with the gases, promoting the combustion. The fire can also be thoroughly cleaned with a minimum of labor and without the escape of dust. It is claimed, with proper management, that fire cau be kept in this stove without attention for several days. Their Hub heater is of the cylinder type with Russia iron body and works on the down draft principle. These stoves have been subjected to practical tests and have established reputations on their merits.

IN FITTING OUT A KITCHEN, whether in a residence or hotel, almost everything needful can be supplied by the Walker & Pratt Mfg. Company, Boston. Their Columbia and New World are cast iron ranges, which have a well earned reputation for attractiveness of appearance, convenience in use and ciliciency in operation. The New World range is provided with a handsome copper plate oven panel, bearing in has-relief a representation of the Landing of Columbus. The steel ranges are made in small sizes, and are also sdapted to be extended to long lengths with several fires for hotel service. They also manufacture warming tables, collee urns and pastry ovens.

BERGSTROM BROS. & Co. of Neenah, Wis., are distributing large blotting pads with one side devoted to advertising their heating stoves. Four styles of these pads have come to hand. One illustrates the Elmhurst surface burner; another, the new construction of the Elmhurst for 1894; a third, the Royal Oak, which was entirely new last season; the fourth, parlor stoves for the

exclusive use of wood, comprising the Spark in three sizes and the Tacoma in

THE LINE of heating apparatus manufactured by the Barstow Stove Company, Boston, has been extensively em-ployed in school houses in connection with the remodeling of the ventilating systems to meet the requirements of the State law. The company issue a pamphlet devoted to this special branch of work.

A PERSONAL LETTER from Frederic Gardner, Western manager of the Michigan Stove Company, Chicago, calls attention to accompanying leaves, intended for insertion in their latest catalogue. The leaves are paged and are precisely like the catalogue leaves, but in their separate form are very fine circulars. One refers to the Carbon-Garland, which is characterized as a parlor furnace for soft or hard ecal. This stove is highly ornamented and beautifully modeled. It is so made that the entire ornamental part is separate from the fire chamber and can be drawn away, thus rendering the latter easy to repair. The combustion chamber is styled a seamless retort, is made in one piece with a dome top and is so constructed as to gain a reverberatory flue, while the chamber is clougated so as to preveut smoke from coming out of the door. It can be used as an upstairs heater if desired. Some peculiar features are that the grate and fire pot are stated to be about inches nearer the floor than in other stoves of similar construction and the stove is made absolutely air tight to insure its being a first-class "fire keeper." The other circular treats of the Maple Garland, which is a first class highly finished base heater, for wood only. In this stove the wood rests upon the bottom and not on a grate. This gives more heating surface and brings the heat nearer the floor. The entire top opens to admit chunks, although there is an extra large feed door. The hot air circulating flues are exceedingly large. In external appearance this stove resembles high grade coal base burners.

WE ARE INDEBTED to the Fuller & Warren Company, Troy, N.Y., for circulars relating to some of their specialties. The cards show the Splendid base burner, the F. & W. Company's Splendid Stewart and the Art Splendid, three handsome stoves for parlor heating. The F. & W. Company's Splendid Stewart is entirely new for 1894. It is described as not a high priced atove, but embodies all the valuable features incorporated in their best base burners. A very pretty card issued by the same concern shows the P. P. Stewart stoves as made in 1838 and 1894, the halftone engravings placed in juxtapositiou, bringing into prominence the improvements that have been made in the last 50 years. The original Stewart stove was brought out in 1838.

THE KERNAN FURNACE COMPANY. Utica, N. Y., issue a new catalogue relating to their well-known line of Kernan warm air furnaces for soft coal. The pamphlet begins with a general treatise on burning soft coal and the advantages of it as compared with hard coal in the matter of price. Then attention is directed to the Kernan smoke consumer, A series, which is a furnace especially adapted for the use of soft coal. Various views are given of this apparatus, and all its constructive features are carefully explained, so that the buyer understands exactly how it is that the construction employed facili-

made aud on what principles it operates. The B series is similarly illustrated, and then attention is given to their patent hexagonal grate, which is used in all the smoke consuming furnaces. A number of pages in the mid-dle of the catalogue are devoted to testimonial letters from customers who have used these soft coal furnaces with the most excellent results. The Kernan system of heating and ventilation is next explained, with diagrams showing the arrangament of heating ducts and ventilating ducts in school houses. At the close brief reference is made to the Kernan hard coal furnaces.

ROUND OAK STOVE WORKS, DOWAgiac, Mich., resumed operations July 24, 300 men being employed.

### Security Gas Broiler.

In the accompanying illustration we present a view of a two-burner gas tates the broiling action of the meat. and that it is more uniformly cooked to its center without burning the exterior Unlike the usual practice in portions. broiling, the drip is preserved instead of being lost in the fire, and thus are avoided the odors arising from wasted hurned drip, which often injure the flavor of the meat. Other sizes of stoves made by the company are provided with four burners in the top surface and have ventilated baking and roasting ovens, warming closet and water heater. A pamphlet which the company have issued illustrates and describes these goods.

A bullet proof shield, the invention of W. F. Leonard of Brooklyn, was tested last week by the military authorities at Governor's Island, New York, with the result that balls that would have penetrated 20 inches of pine were successfuly resisted by the shield. The dictum of the military others is that the object

Security Gas Broiler.

range with barbecue steak broiler, which is being offered the trade by L. B. Jones & Co., successors to the Se-St. Louis, Mo. The body of the stove is black japauned, the doors have nickel borders, nickel name plates and nickel monogram in the center of the japanned panels, nickel knobs, hinge pins and valve wheels, which form a striking contrast with the black por-tions of the body. The important feature of this construction is the steak broiler, which occupies the lower portion, the engraving showing the door open. It will be noticed that the broiler is retained in a vertical rather than horizontal position, the heat com-ing from the sides. Directly beneath is a drip pan for catching the drippings from the meat while in process of cooking. The arrangement is such that the dripping is not burned by the application of extreme heat, as the pan is below the side burners. It is claimed

possesses remarkable resisting power and would turn any rifle bullet, but that the material of which it is composed is too heavy for wearing by soldiers, although it might be useful for protection to field guns. The inventor has already practically tested. ventor has already practically tested the shield by standing up with it to be shot at by a Winchester rifle.

D. Willis James, who has been for some time director of the factories of the Central Stamping Company, 23 and 25 Cliff atreet, New York, has resigned his position and severed his counection with the concern.

Work on the new American liners, St. Louis "and "St. Paul," is being actively earried forward at Cramps' shipyards. The "St. Louis" is nearly plated and her interior fittings are being put in. She will probably be ready for launching by October. The "St Paul" is not quite so far advanced, but she is reported as being also nearly all plated.

# TRADE REPORT.

### The Iron Market.

While modest progress is being made in firing additional Coke ovens, the rate is distressingly slow. The scarcity of the fuel is the dominating factor in the Western Iron trade, and indirectly, of course, affects the Eastern producers. Some of the latter, being largely dependent upon the Connellsville region, suffer. Others are gainers, since the Western works are practically letting the Eastern markets alone. The Eastern mills are therefore taking what current work is coming out, and the breathing spell they are enjoying gives their local markets an air of greater cheerfulness.

In the West the Pittsburgh and Chicago districts are pretty nearly taking care of the requirements of buyers, which on the whole are not great. The movement among Southern fur naces which have long been idle to resume operations is somewhat puzzling. It is pretty well known that the best managed plant in the Birmingham district has stopped because there is no money in making iron, and yet these other concerns, known to be less advantageously equipped and supplied, are again getting ready for the fray.

Pig Iron. - The majority of sellers in the New York market continue to complain of extreme dullness. One case, however, is cited in which a consumer placed an order for delivery during the balance of the year who has thus far persiatently purchased in small lots for immediate delivery. Virginia Irons continue to crowd the market at low prices, relatively little being heard of Alabama brands in that way. We quote standard brands \$12.50 @ \$13 for No. 1; \$11 @ \$12 for No. 2, at tldewater. Southern Iron, same delivery, \$11.50 @ \$12.25 for No. 1. \$10.50 @ water. Southern from, same derivery, \$11.50 @ \$12.25 for No. 1; \$10.50 @ \$11 for No. 2; \$10 @ \$10.25 for No. 3; \$10.25 @ \$10.75 for No. 2 Soft, and \$10.50 @ \$11 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9.75 @ \$10.25.

Very little change is noted in the Philadelphia Pig Iron market. Prices are steady, but the demand has not been active enough to cause any further stiff-fening, notwithstanding the extremely light supply. Alabams Irors are virtually out of the market, and with the recent advance in freights Western brands cannot be sold at the low figures remeet with less competition. The foundry trade is a good deal depressed, and some of the large concerns begin to doubt whether they will find any larger business than they did a year ago. The chief strength of the market arises from the light stocks, small output and higher cost of production, but from present appearances there is not likely to be any material change in prices, unless the de-mand assumes larger proportions than at present. General asking prices are about as follows for Philadelphia and near by points:

 Standard No. 1 Foundry X.
 \$12.50 @ \$13.00

 Standard No. 2 Foundry X.
 11.50 @ 12.00

 No. 2 Plain.
 10.75 @ 11.00

 No. 1 Soft.
 11.50 @ 11.75

 No. 2 Soft.
 10.75 @ 11.00

In the Chicago market dealers in local Coke Iron report only limited sales and very light inquiries. Large consumers who have not yet covered their season's requirements are postponing negotiations until labor troubles have been completely settled and per-haps until the tariff agitation is ended. Almost nothing is doing in Southern Coke Iron and Lake Superior Charcoal. The condition is one of midsummer dullness. Shipments are still interfered with by the irregular movement of freight on some railroads. Quotations are given as follows for cash:

 are given as follows for cash:

 Lake Superior Charcoal.
 \$14.50 @ \$15.50

 Local Coke Foundry, No. 1.
 10.75 @ 11.00

 Local Coke Foundry, No. 2.
 10.00 @ 10.50

 Local Coke Foundry, No. 3.
 9.59 @ 10.00

 Local Soctch.
 10.75 @ 11.00

 Ohio Strong Softeners No. 1.
 13.00 @ 13.50

 Southern Coke, No. 2.
 @ 10.75

 Southern Coke, No. 3.
 @ 10.75

 Southern, No. 1, Soft
 @ 10.75

 Southern, No. 2, Soft
 @ 10.50

 Southern No. 2, Soft
 @ 10.50

 Alabama Car Wheel
 17.50 @ 18.00

 Jackson County Silvery
 15.00 @ 16.60

The Pittsburgh market continues barren of large transactions, but sales of small lots for close delivery are more plentiful. The few transactions going for Foundry Iron are for small lots of 50 and 100 tons and prices are unchanged. For forward delivery the following quotations are made:

There has been an undertone of confidence in the Cincinnati market for Southern Pig Iron during the week, under light offerings and a good job under light offerings and a good jobbing demand, with sales to the extent of the offerings, chiefly in single carloads, and mainly of No. 2 Foundry and No. 1 Soft at \$7.50 \$7\$ ton, f.o.b. Blrmingham, or on that basis. There are inquiries for lots of 5000 and 6000 tons of Foundry grades for Eastern shipment, but there seems to be no one disposed to sell in advance of production while the tariff bill is pending. In the present unsettled condition of the trade no change in quotations is justified, but it does not seem improbable that higher prices may soon be obtained Quotations are as follows:

Southern Coke, No. 1 \$	10.25 @	\$10.50
Southern Coke, No. 2	9.50 @	9.75
Southern Coke, No. 3		
Ohio Soft Stone Coal, No. 1	14.50 @	15.50
Ohio Soft Stone Coal, No. 2	14.00 @	14.50
Lake Superior Coke, No. 1	$12.50\ \widetilde{a}$	13.00
Lake Superior Coke, No. 2	11.50 G	12.00
Hanging Rock Charcoal, No. 1		
Hanging Rock Charcoal, No. 2	15.50 @	16.00
Tennessee Charcoal, No. 1	13.00 @	13.50
Tennessee Charcoai, No. 2	12.00 @	12.50
Standard Southern Car Wheel		
Lake Superior Car Wheel and	20140	27,00
Malicable	18.35 @	16.75

A trifle more activity is noted in the St Louis market, although as yet it has only resulted in sales of moderate size. Indications point to a grad-ual increase in the demand as manufacturers are working more steadily and are gradually increasing their output. The constant decrease in the amount of Iron on the furuace banks leads many to believe that there will be a scarcity before the year is out. At present No. 1 Soft and No. 2 Foundry are difficult to obtain, and prompt ship-ment is only secured at full prices No. 2 Foundry is quoted at  $$10.50 \oplus $10.75$ , f.o.b. cars, St. Louis, and there is no great urgency to sell at these figures.

We quote as follows for cash, f.o.b. ears St. Louis :

Southern Coke, No. 1 Foun-

 dry
 9.75 & 10.00

 Southern Car Wheel
 16.50 @ 17.00

 Ohio Softeners
 14.00 @ 14.50

#### Metal Market.

Pig Tln.-Steady additions to the already excessive spot supply, with a consumptive demand which falls short of those additions, have exercised a depressing influence on the market. A downward course to London prices has also had a heavy effect. Consequently the market has had more or less of a ragged appearance throughout the week. Small parcels from store have been sold at about ½¢ below previous quotations; and for Straits Pig jobbers are now asking from 20¢ to 20½¢ ? lb. The bulk of retail husiness goes, however, at the larger figure. Importations so far this month have reached about 1200 tons, which is equal to the highest estimated consumption for an entire month.

Copper.-Dealings have been on a moderate scale and the demand is without visible improvement. In short. there is little doing outside of making deliveries on old contracts; but, in the absence of any pressure to sell, prices remain quite steady. The moderate business effected by retailers was at about 101¢ P lb for Lake Ingot in small lots.

Sheet Copper.—Orders and inquiries continue on a very moderate scale. The former are usually for very limited amounts, intended for present use. Interest in forward business is very slack. Prices for small jobbing quantities are firm, on a basis of 15¢ net.

Pig Lead -Light spot supplies, along with tariff probabilities, have served to put more stiffness into the market for Pig Lead, and prices have been marked up to the extent of 0.25¢ @ been marked up to the extent of 0.204 (a) 0.304 (b) The buying movement has not, however, been at all brisk, and business done during the week makes but a moderate showing. Jobbers' prices for small lots of American Pig are firm at 37¢ @ 4¢, tending more to the higher figure.

Lead Sheet and Pipe. - Extreme dullness has marked the trade in Manu factured Lead in this vicinity. Prices are almost down to the present level of Pig Lead, yet the buying interest continues very tame. Building operations do not expand to any extent, and the outlook is not regarded as bright by the manufacturers, who can see no prospect of advancing prices at present. In any case an improvement in business is not looked for before the fall. Some of the larger dealers in plumbers' supplies report a fair demand, but these are the exception to the general rule of dullness.

Spelter.-Little change has taken place in prices and the demand is without visible improvement, but sellers offer with more or less reserve in view of moderate output at the present time. Quotations remain at about  $4\frac{1}{4}\phi$  for limited quantities of ordinary Western.

Antimony. — The market remains quiet, with only a small routine trade passing. Prices are steady at about 10% for Cookson's and 10% for Hallett's, in small lots.

Nickel.—Sales have been made of moderate quantities at  $40\phi \otimes 42\phi$ , and the market is rather easy.

Fin Plates.-The stereotyped tale of dullness which has been iterated monotously from week to week for so long is the only one which has fitted this week's market. Little or no improvement can be noted. Buying has almost entirely been confined to small orders for spot goods and future deliveries have attracted only the feeblest interest. The only line which can be said to bave been at all active is American Roofing Plates, which are in good demand. These, being largely purehased directly from the makers, do not appear as an important factor in the general market. Nevertheless the consumption must be tolerably large, as almost all the domestic works are reported as being busily occupied in turning out material to fill orders while some have contracts on their books which will suffice to keep them busy for the next two or three months without any further orders. The output of American Roofing Plates, too, has increased materially since the beginning of the year. Prices in the general market show a soft tendency, although no radical change is noted.

A special cable dispatch from London to The Iron Age, dated July 25, thus describes the British Tin Plate market: The Tin Plate market has been weak. Inquiries are few and limits on bida are generally lowered, and this prevents business. Uncertain reports regarding American tariff legislation also have unfavorable influence. On open offering prices are about 3 pence lower than they were last week. Prices f.o.b. at Swanses are as follows:

Bessemer Cokes, 14 x 20,		a	10/
Siemens Cokes, 14 x 20			10/3
Ternes, double box			19/
Charcoals	11	(0)	13/

Black Plate has met with rather slow sale. Prices are easy at about £7. 17/6 for Bessemer and £8, 2/6 for Siemens.

Sheet Iron.—The Western mills are reported ss busy, with a good run of orders and inquiries. Jobbers in this section, nevertheless, report a limited demand and tame inquiry, except for Black Sheets for tinning, the demand for which is just now in excess of the supply. With the starting up of a number of Tin mills since the signing of the wage scale the supply will, however, gradually increase and probably be equal to current requirements. Prices show no improvement. Galvanized Sheets in small lots are quoted generally at 75 and 5 % off.

Texas cotton crop prospects are exceedingly bright. Reports mention a probable yield of 2,500,000 bales, and it is thought doubtful if the crop can be harvested unless the fall is an open one so as to allow of picking until the end of the year.

Columbus, Ohio, and Cincinnati, are to be connected by an electric line over the National Road, running through London, Springfield and Dayton. The road is already completed from Cincinnati to Dayton, and the entire line is to be finished by the end of 1896.

## Chicago Report.

Scrap.—Old material is in very little demand at present. Dealers quote the following list of buying prices, Chicago delivery:

Per	uet ton.	Per lb

The experiment of shipping naphtha in bulk was made last week for the first time, by the steamship "Heligoland," which sailed from Philadelphia for Hamburg carrying 1,200,000 gallons of the oil in tanks. Hitherto, owing to its dangerously explosive character, the fluid has been shipped in carefully potected barrels. A great deal of interest is felt in shipping circles in this new departure.

Heavy sugar importations continue at the ports of New York, Boston and Philadelphia. Not only sailing vessels but transatlantic ateamships also have been temporarily diverted from their deep sea routes to accept the high freights offered by the Sugar Trust for spot eargoes.

A statement recently issued from the Comptroller's office at Albany, N. Y., shows that the number of New York corporations on the books for taxation has increased since January I from 2513 to 5944. The sworn statements of the old corporations exhibited an average decrease of 27 per cent. In the value of the capital stock as compared with last year.

#### CONDITION OF THE

# Hardware Trade.

MANUFACTURERS and their representatives usually refer to busresentatives usuarly refer to bus-iness as very quiet, but further inquiry generally develops the fact that some trade is doing. A good many travelers are on the road, but they are not all out as yet, the condition of business making their work, so far as immediate returns are concerned, rather disappointing. The importance of keeping in touch with the trade and securing such business as is going makes some enterprising houses regard the present as a good time to cultivate their customers and form new connections, if possible, and thus lay the foundation for future business. The uncertainty in regard to the Tariff bill is still exerting its depressing influcuce, and the doubt as to what will be the final outcome is at the present time having an exceedingly unfavorable effect. In the matter of prices there is little to report. Comparatively few open changes have been made by man-ufacturers, but in a good many lines the gradual declines which have been taking place as small extra discounts have tollowed one another have low-ered the price of a good many leading Under these circumstances it goods. Under these circumstances it is not surprising that there is something of a lack of uniformity in quotations as made by the different manufacturers and by the leading jobbing houses. The careful buyer, whether connected with the wholesale or the retail trade, is required to give much attention to prices that he may be enabled to place his orders indiciously. abled to place his orders judiciously and to the best advantage. There is and to the best advantage. There is a perceptible tendency on the part of leading jobbers to quote what would in ordinary circumstances be regarded as very close prices to their retail customers, and the market is feeling the effect of the "cut prices" thus made.

Advices from Chicago.—The demand for Shelf Hardware has steadily improved since the termination of the railroad strike, and business is now in very much better condition than it was two weeks since, but there is still room for considerable improvement. Orders are small but numerous, and of such a character that unusually close attention must be paid to their trade by traveling salesmen. Merchants appear to order what they need every day and are seldom anticipating their requirements for even a week. The salesman on the spot gets the order. Here and there a new stock is being put in by some one who sees an opportunity for engaging in business, but new ventures are much less numerous than in previous years. Some little demand is reported for fall and winter goods, but as such orders are entered for future delivery, they are having no effect in the present movement of merchandise. A hopeful feeling prevails among the jobbers in this vicinity owing to the encouraging reports received from their representatives regarding the crops in the different sections tributary to this market. Overflowing granaries, they believe, mean a much better business among farmers, notwithstanding low prices for grain. The Heavy Hardware trade is in good condition, although the demand is almost entirely for small lots. These orders, however, are quito numerous, and every day piles up a good aggregate.

## Notes on Prices.

Wire Nails.—The Wire Nail market continues without special feature, the mills being shut down and manufacturers are refraining from making special effort to secure orders. They apparently regard the outlook as promising for the maintenance of present prices. and some of them refer to the fact that if the fall trade should set in with any degree of vigor there would probably be a stiffening in the market. mean time the volume of business is light, as merchants are indisposed to place orders in excess of their requirements, and in the present condition of business their immediate needs are not Quotations continue en the large. basis of \$1.15 for carload lots at mill, a figure which is, however, sometimes shaded, but none of the manufacturers are willing to quote lower than \$1.10. The New York price for small lots from store is \$1.30 to \$1.35.

Advices from Chicago.—The fall trade seems to be starting up and some buying from manufacturers is going on even in Chicago, which has been thus far troubled with a surplus stock. Manufacturers are very confident that they will be able to maintain prices. They seem to have control of the situation and are not disposed to press sales and sacrifice what little advantage they may have at present. Factories will start up about August 1. Prices on factory lots range from \$1.18 to \$1.25, Chicago. Jobbers report that their customers are not disposed to buy heavily, but are acting very cautiously, as they do not wish to be caught in a decline. The movement of Nails, as well as other staple goods, is increasing to some extent, and better business is looked for from this time forward. Small lots from stock are quoted at \$1.25.

Cut Nails—In the present state of trade the volume of business in Cut Nails is naturally light, but the manufacturers are adhering quite firmly to prices which have prevaited for the past tew weeks. The Eastern market is represented by the quotation of 95 cents to \$1 for carload lots on dock. The store price for Cut Nails in New York is \$1.10 to \$1.15.

Advices from Chicago.—Inquiries are improving, but the volume of business is still only moderate. Prices are a trifle firmer and mill shipments may now be quoted at 95 cents, Chicago, for 60-cent average. Small lots from jobbers' stocks are selling at \$1.15.

Barb Wire.—There is as yet exceedingly little movement in Barb Wire and prices are unchanged. Manufacturers are refraining from making important concessions in order to secure business, and some of them express hopeful views in regard to the fall trade. The market is represented as at our last report by the following prices for Four-Point Galvanized delivered at the points named, but it is thought that concessions from these prices could be obtained on attractive orders: Pittsburgh, \$2.05 to \$2.10; Cleveland, \$2.10 to \$2.15; Cincinnati or Allentown, \$2.25 to \$2.30; Chicago or New York, \$2.25 to \$2.30.

Advices from Chicago.—The movement is light but there is still no indication of unessiness among manufacturers. They are probably in a better position to sustain prices than for many months. Their raw material is firm and besides a good understanding prevails among them now and any changes in price seem to be made in unison. Jobbers quote small lots of Galvanized Barb Wire from stock at \$2.35 to \$2.40, with 10 cents off for carload lots. Quite a brisk trade has been done in some quarters in Plain Wire, on which recent advances are well sustained.

Utility Washer.—This Washing Machine was described in our issue of 21st inst. It is manufactured by Olds Wagon Works of Fort Wayne, Ind., by whom it is sold to the trade at \$2.75, net

Sargent & Ce --In connection with their new catalogue, Sargent & Co., New York, and New Haven, Conn., issue a discount sheet of special interest to the trade. It gives not only the discounts on the very large and important line of goods of their own manufacture, but also on an extensive assortment of general Hardware, which includes many leading goods. Those prices are carefully revised up to date.

Cabinet Locks.—The prices on Cabinet Locks are unsettled and the market is in an unsatisfactory condition. This is largely the result of the new competition which recently entered the field, carnest efforts being made by them to obtain business, while the old manufacturers are apparently determined to hold their trade.

Padlocks.—While there has been no open change in the price of Padlocks, there has been for some time a weakness which results in somewhat lower quotations than prevailed a few months ago. There is some unevenness in the quotations of the different manufacturers, who are evidently desirous of securing such orders as may be within their reach.

Wrought Goods.—The market for Wrought Iron Goods is in an unsatisfactory condition, prices being low and irregular, low quotations being more readily obtainable by the smaller trade than is usually the case.

Bright Wire Goods.—The demoralization in the price of Bright Wire Goods, to which we referred some time ago, still continues and the market is lower and somewhat irregular. Manufacturers appear to be giving discounts which approximate their extreme prices somewhat more freely than a short time ago, and many of the leading jobbing houses are quoting this line of goods at low prices.

Screws.—The Screw market is at present an open one, the agreement which has existed among the principal manufacturers having terminated June 30. Whether or not there will be a renewal of it is a question, but it is understood that some conferences have been had with this end in view.

Double Pointed Tacks.—An advance has been made by the manufacturers of Double Pointed Tacks, and as a result the market is in a better condition than for some time.

Glass.—The demand for American Window Glass shows no improvement since our last review, although the volume of business is, of course, greater than a few weeks since. The bulk of the business done is in small lots to meet immediate needs. Manufacturers and jobbers are watching the tariff question closely, and conducting their business in such a way that, in the event of the passage of any low tariff measure, they will have little or no stock on hand. The Pittsburgh quotation on Window Glass continues at 80 and 20 per cent. discount, a price which is reported to be firmly maintained. Plate Glass is in fair demand. Quotations for New York and New England, on the Eastern list, are 70 per cent. discount for sizes 5 feet and over, and 70 and 10 per cent. discount for sizes 5 feet and under. For the West quota-

tions are reported as 70 and 5 per cent. discount for sizes over 10 feet, and 60 and 20 per cent. discount on sizes 10 feet and less, Western manufacturers' list

Old Metals -- The market for Old Metals continues quiet, with values practically unchanged. The following quotations represent about the prices now paid by New York dealers:

### Trade Notes.

Tubular Lanterns and Lamp Goods is the subject of the revised jobbers' price-list No. 2, issued by the Buhl Stamping Company, Detroit, Mich., under date of July 17. Jobbers desiring to secure a more attractive line are invited to inspect the pages of this catalogue, which show a number of most attractive articles. The greatest improvement in the current year is alluded to as their No. 15 Side Lift. They also call attention to their new No. 200 Lantern with extra large oil well and No. 2 burner. They invite special attention to their claims for the Square Top Lift, Dash Reflector and Enameled Lanterns and to the popular case assortments of their manufacture. The goods are illustrated in plain engravings and also in colors, descriptions being given together with price-lists, table of sizes and code words for telegraphing orders.

STRANSKY & Co., 27 Murray street, New York, are distributing to the trade a series of entertaining cards, labeled A B C Class, High Primary Class and Grammar Class, on which the questions and answers of teacher and scholars are recorded, being sums in arithmetic, the Stransky Ware being the subject discussed. The cards are cleverly worded and will entertain the trade.

THE PUGET SOUND HARDWARE & STOVE COMPANY have been organized at Tacoma, Wash.. with a capital stock of \$25,000. The incorporators are George D. Hanscomb, J. W. Clocs and Frank De Wall.

THE PLANT of the Youngstown Stamping Company, Youngstown, Ohio, manufacturers of Oil Cans and Tin Specialties, is in operation to nearly full capacity. The firm have a fair amount of business on hand, but the outlook for the future is not as encouraging as desired.

The Illinois Pure Aluminum Company, Lemont, Ill., have resumed operations, 50 hands finding employment. The company have just received an order from the Burean of Equipment of the Navy Department at Washington for a 60 gallon jacketed aluminum kettle for the cruiser "San Francisco."

THE PLANT of the W. Dewees Wood Company, McKeesport, Pa., manufacturers of patent planished aheet iron, was put in full operation on Monday morning, the 15th inst. How long the plant will be operated in this way depends entirely upon the receipt of orders.

THE CINCINNATI CORRUGATING COMPANY started up their rolling mills at Piqua, Ohio, last week, causing much rejoicing among the idle workmen,

TACOMA (WASH) CORNICE, MANTEL & FURNACE COMPANY have been incorporated, with a capital stock of \$20,000, in 200 shares of \$100 each. The incorporators are Paul W. Dreusike, and William A. McKinley. The business of the company will be to manufacture heating apparatus, cornice and mantels.

THE ZUCKER & LEVETT CHEMICAL COM-PANY and the Loeb Mfg. Company have consolidated, under the corporate name of Zucker & Levett & Loeb Company, with offices at 8, 10, 12 and 14 Grand street, New York. The new concern, with their increased facilities, are prepared to promptly execute ordera.

#### New York Trade School.

The new catalogue of the New York Trade School for the fourteenth season, commencing October 15, 1894, has just been issued. Although similar in get up and in its main features to those of former years, the catalogue contains some additional matter, which will be of special interest to the readers of The Metal Worker. Particulars are given of two new trade classes, to which brief reference has already been made in these columns, namely—a day class in steam and hot water heating and a day class in tinsmithing, roofing and cornice work. These are both trades in which such instruction as is given in the New York Trade School is sure to be popular and appreciated. Full particulars in regard to these classes will be found in another part of this issue.

A melancholy feature of the first page is the disappearance from the list of trustees of the honored name of the founder of the school, Colonel Auchmuty, whose death since the isanc of the last catalogue is suitably announced. A copy of the minute of the Board of Trustees relative to his death is also presented. The name of R. Fulton Cutting appears as president of the board, and Archibald K. Mackay fills

the vacancy caused by Colonel Auchmuty's death. In the list of Trade School committees that of the Master Plumbers' Association is unchanged, two changes are shown in the Master Painters' Committee and two in that of the General Society of Mechanics and Tradesmen of New York. Two new committees, from the Master Steam and Hot Water Fitters' Association and the New York Employers' Association of Roofing and Manufacturers in Sheet Metal, repectively, appear for the first A noteworthy change announced in this catalogue is the extension of the day classes from a course of three to one of four months. This alteration has been made in order to give time for the provision of instruction in plan drawing to each trade.

The plumbing classes remain under the superintendence of John Delehanty, and the general curriculum for both day and evening classes is unchanged. There will be two evening classes, lim ited to 75 young men in each. Manual instruction will be given to class No. 1 on Monday and Wednesday evenings and to class No. 2 on Tuesday and Thursday evenings, from 7 to 930 o'clock, the course of instruction being the same in both classes. Scientific in-struction will be given to both classes every Friday evening, from 7.30 to 9.30 o'clock. Instruction will commence on October 15 and terminate on April 4. During the last week of the course the examination will be held and certificates will be awarded to those entitled to receive them. A four months' day course of instruction in plumbing and gas fitting, including also drawing of plans, will be commenced on December 3, 1894, certificates being given on April 4. The instruction is given every day, from 8 a.m. to 4 p.m., except Saturdaya, when work is stopped at 2.30 p.m. The fee for the course is \$40, to be paid when the name is entered.

This class is limited to 120 young men. Last season the number of applications for admission was in excess of the capacity of the workmanship, and, to the regret of the management, many had to be refused owing to the lack of room. Entrance can be made commencing October 1, and applications will be received until the class is full. Young men are warned not to come to New York unless they have been notified in advance that their application has been accepted. The school, it is stated, will not be responsible for expenses incurred by young men who come to the city without previously ascertaining if admission can be secured.

Evening instruction begins on stated dates and is given in bricklaying, plastering, atone cutting, plumbing, house, sign and fresco painting, carpentry and blacksmithing. Day classes are held in plumbing, painting, carpentry, steam and hot water heating, Ensmithing, roofing and cornice work, and printing. All these trades are carefully and thoroughly taught by competent instructors. The fees for the evening classes range from \$12 to \$25 per course, and for the day classes from \$25 to \$40. During its existence no less than 4675 young men have passed through the New York Trade School, the day classes being represented in 38 different States, as well as in New Brunswick, Nova Scotis, Prince Edward's Island, and the Dominion of Canada.

J. G. Mallett, formerly located in Greenfield, Ind., has opened a tin shop at Defiance, Ohio.

#### The Question of Guarantees.

It is now questioned in the heating trade whether the guarantee usually given in heating contracts, that the apparatus shall be competent to heat the building in which it is to be placed to a temperature of 70° F. in zero weather, does not open the way to loss. disappointment and worry on the part of the contractor, and give an undue advantage to owners of buildings. The estimate of cost on which the contractor makes his proposition to do the work for a stated sum is. of course, founded on the assumption that the building he guarantees to heat is of reasonably good construction. In the absence of accurate knowledge on this point he must assume this. To assume that the building is of the very best character would be to take the risk of an insufficient apparatus; to assume that it is of the poorest style of "skin" building would entail an estimate of cost so high that, in the majority of cases, the contractor would stand no chance of securing the contract. He is, therefore, compelled to take a middle course, and if the building turns out to be of the poorer sort he may often find that he has underestimated the extent and cost of the apparatus needed to make good his guarantee. We believe that few heating contractors have escaped this experience, and many will testify to more of it than is desirable or profitable.

#### A Reform Needed.

In the matter of such guarantees, some in the trade are beginning to urge that a reform is needed. If a contractor in good faith estimates for an amount of heating surface such as would be adequate for reasonably good construction, it seems a hardship that under his guarantee he must suffer for the shortcomings of other contractors who have preceded him, or, perhaps, for the parsimony of an owner who has built for speculative

purposes and has been unwilling to pay for good work. On the face of it, this is unjust, yet as the usual guarantee legally binds the contractor he cannot under the present system es cape the provisions of his agreement. In the matter of chimneys, contractors have learned that it is unsafe to put in heating jobs without a guarantee from the owner that the chimney flue shall be good and sufficient. Why not take another step and make the guarantee to heat to sufficiently warm a building during the cold weather to which it will be exposed hinge upon the owner's guarantee that the building shall he well constructed and reasonably impervious to drafts? An apparatus gnaranteed in the usual manner in a building erected in New York City was totally inadequate to do the work contracted for. The building was so badly constructed that in windy weather heavy velvet carpets were lifted from floors and slapped up and down like awnings over sidewalks. The contractor had no recourse and was obliged to nearly double the extent of the surface and put in a much larger boiler before he could satisfactorily warm the building. If in this case his guarantee had been made contingent upon good construction he would have met no difficulty in proving that, for a well built house, the surface originally specified was ample, nor that a house in which heavy carpets were disturbed, as stated, by incoming drafts was not a well built structure. This reform in the terms of guarantees being entirely reasonable a little persistent effort on the part of contractors in effecting it would be well expended.

#### Still Another Evil.

The present mode of drawing contracts for heating work entails another disability upon heating contractors, which is felt by the entire trade. The guarantee to heat a building to 70° F. in zero weather affords an excuse for postponing final payments which is seized upon by many owners with a readiness affording a good example of human selfishness. No matter how responsible the house may be that has executed the work, no matter how strongly it may be urged that the guarantee they have given legally binds them to supply any deficiency, should there prove to be a deficiency, these statements are met by the answer, "I do not yet know that you have done what you agreed to do," and on this ground payment is withheld. Perhaps this is the worst feature of the whole business, since contractors of repute are always ready to make good their guarantees whether they have received full pay for their work or not. Heating contractors

should be paid as promptly as other contractors, and contracts should be so drawn as to afford no excuse for withholding payments, as is now done, because of delay in the coming of weather cold enough to test the capacity of the apparatus. It is well that the trade has reached the conclusion that the ordinary forms in which heating contracts are drawn should be changed to remove their objectionable features, and by unity of action a reform can be effected.

#### Tin Plate Production.

Col. Ira Ayei's special report to the Treasury on the production of tin and terne plates in the United States during the quarter ended March 31, 1894, which is printed in another column, is of a highly interesting and satisfactory nature. Notwithstanding the depressed industrial condition of the country and the uncertainty regarding tariff legislation, which might have been expected to operate disastrously on the industry, the report shows a really remarkable degree of progress to have been made. Thirty-six reporting firms manufactured 38,260,411 pounds of tin and terne plates proper against an output by 39 firms, in the preceding quarter, of 27,351,241 pounds, an increase of nearly 11,000,000 pounds. The most striking fact, however, in connection with this output is that 27,765,162 pounds, or more than 72 per cent. of these plates were made from sheets rolled in the United States, and of this amount over 95 per cent. consisted of the lighter class of plates. In the previous quarter the proportion was 58 per cent., and in the quarter before that it reached but 32 per cent. The stride made in the production of American black plates for tinning purposes lighter than 63 pounds per 100 square feet is also a very satisfactory feature, which is clearly shown in the tables presented with the report. The total production of black plates during the quarter, by 18 reporting mills, was 30,070,701 pounds, against 19,676,910 pounds in the December quarter of last year, while more than 78 per cent. of this material belonged to the lighter class of plates. These show an output of 6,317,217 pounds in excess of that of any previous quarter under the Mc-Kinley law.

Director Preston of the Mlnt Bureau places the world's consumption of gold in the industrial arts at the value of \$50,177,300 annually, and that of silver at the coining value as \$27,554,280, making the commercial value at the commercial price of silver during the year (\$0.78), \$16,622,980.

# THE LETTER $B0X_{-}$

#### Flower Stand Fountain.

From Tink, Pana, Ill.-Please give me in The Metal Worker the plans and details of a fountain to be made of tin, suitable for a flower stand.

Note -We think if our correspondent will consult back issues of The Metal Worker he will find authorient information on this subject to cover his case. We would refer him to a show window fountain illustrated and described in The Metal Worker of May 3, 1890, page 31; also to show window fountain in the issue of October 15, 1892, page 36. There likewise was a design for a galvanized iron vase in the issue for March 25, 1893, page 41, that may be useful to him. The sheet metal fountain described and illustrated in The Metal Worker April 1, 1893, pages 42 and 43, is another design. We think by consulting these issues our correspondent will get suggestions that will enable him to design a fountain to suit himself.

### Pressure on Cylinder.

From J. G., Philadelphia.—In building filters I have allowed the city water pressure to fall on the outside of cylin-drical tubes of clay encased in metal jackets. A mechanical friend asserts that my tube will stand as great a liquid pressure on the inside as on the outside, which I deny. My theory is, that the cylinder with pressure on the out-side acts as an arch for strength, while if the pressure were admitted on the inside of the clay tube it would burst at much less pressure.

Answer .- We think our correspondent is undoubtedly right in his deduction. Where the pressure is applied to the outside of a cylinder, the material being arched, is subjected to compression, while if the water were admitted to the inside of the cylinder the material would be subjected to tension. It is needless to point out that clay has much greater strength to resist compression than it has to resist tension. A brick will stand great pressure, but it would not take any tremendous force to pull it apart, and the conditions of the case are parallel with the instance referred to by our correspondent.

### Wants to Build a Fruit Drier.

From Eastern Shore, Maryland.— 11 °C. O. F. Y." had given some idea of the capacity of the fruit drier he wishes, it would be easier to supply the information he saks for in The Metal Worker, April 28. Ilowever, I have made several for setting on the back part of a cook stove, with the smoke pipe running up through them. They were made of sheet iron or tin and sup-

the back of the stove; they were 24 inches wide, or wider, according to the width of the stove; 14 inches or more deep, from front to back, and from 24 to 36 inches high. I have made some with double boitom, perforated, so that the air which entered was distributed all through and too much air did not enter at one time. The stove pipe furnished sufficient heat for ordinary use. On the inner sides of the drier I riveted angle pieces for supporting shelves about 21 inches apart. The shelves were made inches apart. of woven wire, with a wire run around the outer edge to give them strength. The sides were perforated with some holes a few inches from the top, to give the air that came in at the bottom a chance to escape. The back and bottom were perforated with a inch holes, about an inch apart, all the way across at the stove, so that the hot air from the top and back of the stove could enter. Over the holes in the back I arranged a hood to collect the air and force it into the drier. I have also used a hot air furnace in connection with a large drier, the furnace aetting on one floor and the drier being arranged on the floor above. A large pipe—in fact, the full size of the casing of the furnace—ran up to the bottom of the drier on the floor above. This drier was 31 x 4 feet and stood 5 feet high. It was made of sheet iron and had trays made of wire, as described for the smaller drier. The drier had doors, so that the trays could be removed and the fruit moved higher up in the drier as the process of drying became more complete. From the top of this drier a large pipe went up through the roof of the building to let the air escape and induce a rapid current through it. I shall be glad to hear from any one who has a better plan for making fruit driers, as the season is at hand.

#### Lifting Power of Pumps.

From J. L. C., Brooklyn, N. Y.-I read in one of the back numbers of The Metal Worker that a pump, theoretically, should lift water to a hight of 34 feet, but in practice 25 feet is the usual Are there not pumps lifting hight. water from a much greater depth than 34 feet, and, if so, how is it done? How is the water forced to the surface from artesian wells?

Answer. - We do not recall the exact place from where our correspondent quotes, but we were evidently talking about lift pumps. The limit of hight to which water will rise in a vacuum is, as we there stated, 34 feet, but it is not practicable to set a pump at this hight. Water is undoubtedly forced from much greater depths than 25 feet, or even 34 feet, but the pump plunger must be brought within that distance. Water, for lnstance, is pumped out of mines several thousand fect in depth. One old practice for doing this was to make long wooden piston rods, workported by brackets which were bolted to | ing them from the engines at the mouth

of the mine and having the piston rods communicate power to a pump down at the bottom of the working. This is the same plan that is followed in ordinary pumps from deep wells. The pump rod goes down to within a short distance of the water and then the water is forced up. A valve is placed at the outlet of the pump which, at the end of the stroke, closes and prevents the water in the discharge pipe from running back. At each successive stroke the column of water is thus raised until finally it reaches the surface.

#### Setting Water Motors.

From F. P., Washington, N J .- I would like to get some information on water motors-that is, how they should be act, how the main should be tapped, what size of pipes to use, &c.

Answer. - As the power of a water motor depends entirely upon the hydrostatic head or pressure at the motor, it should in all cases be set at as low a point as possible without interfering with the proper drainage of the tail water. Where water for power from a water works is used by measurement, its quantity is specified without regard to pressure, and as pressure is the exponent of hydraulic power in the terms of its amount in pounds, or its static head in feet, then every foot of head gained by the setting of the motor is power saved. Where water is delivered from underground mains into cellars the stated pressure is measured at that level. Any position of a motor above that level loses one pound pressure for every 2.3 feet that it is set above and gains in proportion for any distance below; so that as a rule it is better to transmit the power of a motor by belt or band from the lowest possible point for proper drainage than to set the motor on the main or upper floors, as is too often done with disappointing effect as to the amount of power and its cost. The size of the service pipe and its length from the main to the motor are most important factors of economy. The larger and shorter pipe lessens the running friction. The length of the pipe after the location of the motor is arranged is a fixed exponent of its diameter for a reasonable loss of friction head for the required quantity of water for a given power. In general terms, the rule is that friction is in proportion to the length of the pipe for stated velocities, and nearly as the square of the proportional difference in velocity; as, for instance, a pipe 200 feet long has twice the friction of a pipe 100 feet in length with equal velocities, while in the same pipes the friction at twice any stated velocity will be four times the friction at the stated velocity, with a slight coefficient of decrease in friction with increasing velocity. The size of a service pipe for any required power cannot be simply stated, but must be considered under the general conception of the rules for friction and volume of flow under a stated head or pressure for the required power.

In this view it may be said that the largest possible size gives the greatest economy in power. In order to get at a reasonable size for the service pipe for any motor, under all of the conditions of volume, pressure and friction, the power required and the pressure or head ascertained must be the starting points upon which the process of computation may be made, as follows:

One cubic foot of water per minute falling 1 foot through space or projected through a nozzle under 1 foot head, or 0.433 pounds pressure per square inch, upon a motor of the best form at 85 per cent. efficiency is equal to 0.0016098 of a horse-power, and 0.0016098 multiplied by the pressure head in feet will give the value of 1 cubic foot of water in horse power under the stated head. For example, 43 pounds pressure or 100 feet head × 0.0016098 = 0.16098 horse-power per

cubic foot per minute.

Now, if the motor is required to yield

a  $\frac{1}{2}$  horse-power, then  $\frac{0.5}{0.16098} = 3.105$ 

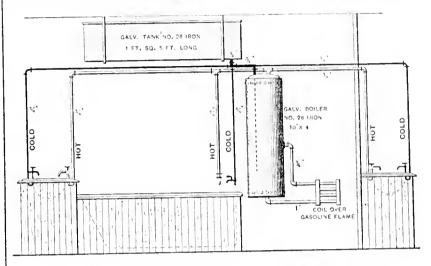

cubic feet per minute must be the flow through the pipe. Limiting the loss of head by friction at 6 feet, or 2 62 pounds pressure, we find in the published tables on the friction of water in pipes that a 11-inch pipe meets all the conditions, and for 1 horse-power a 11-inch pipe, and for 1 horse power a 2 inch pipe, 3 inch for 2 horse-power, and so on. These being iron pipe sizes are the nearest to the exact figures for area and for any length of 100 feet and less. For any material increase in length, or if there are a number of elbows in the line, the next size larger pipe should be used for each of the powers, as above stated. The main should be tapped as near the size of the service pipe as the rules of a water company will allow. Any constriction at the main gives less value in power for the quantity of water that is paid

#### Heating Water for Bathroom.

From F. J. L., Lawton, Mich.—Having taken your valuable paper for a number of years and gleaned from its pages considerable information, I desire to ask for more light on a subject with which I am very little acquainted. I send herewith a sketch, Fig. 1, of the system I propose to use for heating water. I have a bathroom about 8 feet square, but have no available means for heating water. Thinking that the plan which I have mapped out might work I thought before putting it in operation it would be better to have the opinion of The Metal Worker and its readers. I

intend to hang a No. 26 galvanized sheet iron tank, 1 foot deep, 1 foot wide and 5 feet long, near the ceiling for a supply tank, to be filled by a force pump from a cistern to supply a boiler 10 inches in diameter and 4 feet high. The top of the boiler will be about 3 inches below the bottom of the supply tank and the connection will be 4-inch lead pipe, the pipes to the faucets being 4-inch pipa. The double lines show the hot water pipes. The inlet to coil will be 1-inch lead pipe and the outlet 4-inch. There is a wash-

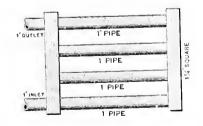

warrant its use in all cases. Although no dimensions are given, it is hardly likely that sufficient surface is exposed in the heating coil shown in Fig. 2 for supplying the quantity of hot water required. The water heating coils employed in gas ranges, as a rule, expose from 2 to 2½ square feet of surface to the flame, equivalent to 6 or 7 lineal feet of 1-inch pipe, and we think that pipe of the length mentioned

Heating Water for Bathroom -Fig. 1.-Showing Method Proposed.

bowl in bathroom as well as in the bedroom. The heating coli, shown in Fig. 2, is to be made with the four 1-inch brass pipes in the center, soldered to the two end 11-inch square copper pipes. These pipes are soldered on the inside and are so placed as to be beyond the reach of the flame, preventing all danger of melting. The inlet and outlet are of 1 inch copper pipe. I intend to heat the coil with a gasoline flame.

Note.—The system of piping shown is correct, but we think that \$\frac{8}{3}\$ inch pipe will hardly be satisfactory from the fact that water will run through it very slowly, due to the small pressure gained from a tank so slightly elevated

 $Fig.\ 2. - Proposed\ Gasoline\ Water\ Heater.$ 

above the fixtures. Better results can be obtained by the use of  $\frac{5}{5}$ -inch pipe. A 3-foot 12-inch boiler would likewise be more satisfactory in this case, we think, than the one of larger dimensions mentioned by our correspondent. If any difference is to be made in the sizes of the pipes connecting with the water heating coil, that from the bottom of the boiler should be the smaller of the two. Some authorities assert that sufficient advantage is gained by employing one size larger pips for the return from the heating coil to the boiler to

bent into a coil 6 or 7 inches in diameter and brought to a cone at the top would heat the water better than the device shown. It might also be advisable to make the tank for storing water of larger capacity, 3 feet or more wide being better adapted for the purpose. It is quite probable that some of the devices on the market for heating water quickly can be used in connection with the proposed tank and give good resuits without the use of the proposed boiler and heating coil. They are made to heat the water as fast as it runs through them, some being made to use gas and others to use gasoline as a fuel. No quantity of hot water is stored by these devices, but as they heat so quickly no inconvenience is had from delay.

## Comparative Cost of Fuels.

From Pennsylvania Gas Furnace Company, Butfalo, N. Y.—If "S. D.," London, Ont.. who asked for information in The Metal Worker of July 21. will write us we will be glad to give him any information on the subject he wants. Gas at \$1 per thousand in a coal furnace is out of the question. At 25 cents per thousand it compares favorably with coal in same furnace. To burn gas successfully and economically it must be a gas furnace.

The Bank of England celebrated its two hundredth anniversary on July 27. The charter of incorporation was granted in 1694 by William and Mary.

The Southern Railway has set aside a separate fund for the promotion of small industries along the several lines embraced in the new system.

## Progress in Galvanizing.

Progress in the ait of galvanizing, or coating iron and steel sheets with zinc, or spelter as it is commercially known, has traveled by easy stages. Some additional conveniences have been added to galvanizing shops and various minor economics have been introduced during the past 50 years, but otherwise the methods employed are changed very little. An impetus has, however, been recently given to progress in this line, and the merits and demerits of the best known innovation are receiving considerable discussion among those engaged in the industry.

The attention of galvanizers of iron and steel sheets in the United States has been drawn with a great deal of interest during the past two years to an improvement in their art known as the Bayliss machine, so named after its inventor, who, in the interests of a company of Wolverhampton, England, controllers of the invention, has been quietly introducing it to the American trade during the time mentioned. The machine was also on exhibition during the World's Fair, in the British section, but has otherwise received but little public notice, and singularly enough had no competitors at the exposition. It is now the subject of much consideration. Several manufacturers have put the machine to a practical test, and in several instances it is known to have performed its work in the manner promised, and has been found of greater capacity than the old dipping process. One of these machines is now being placed in the works of the oldest galvanizing concern in this country.

There is but one basis of comparison upon which it can be judged, and that is with results obtained by the old hand dipped process. In this comparison it is claimed for the Bayliss machine that there is freedom from the rough edge of adhering zinc found on sheets dipped by the old process, unless they are afterward treated to remedy that defect (which is a source of expense). In addition to this, it is claimed that the total quantity of spelter used to coat a sheet is much less than in the old method, yet the coating is more perfect, being more evenly distributed and equally lasting. Other improvements will be noticed in the description of the machine which follows.

#### General Description.

To properly describe the method of operating under this process a ground plan of a galvanizing shop suitable for two pots is shown in Fig. 1. After leaving the mechanical pickler sheets are stocked in various vats containing water which washes the remaining acid from their surface and are passed as required to the vats situated next to the metal pots, where the Bayliss improvement commences. The course of the sheets is clearly explained in the drawing, but for details reference is made to Figs. 2 and 3, representing respectively the plan and elevation of the Bayliss machine. The postions of men and boys employed are designated in Fig. 1 by asterlsks and will be referred to later.

When the sheets of iron or steel after passing through the pickling and washing process are taken from the vat nearest to the metal pot, they are passed through rollers A, Fig. 2, which are held closely together, and immediately enter the pot of molten metal with which thay are to be coated, being guided by arch B, made of light bariron, and passed

through flux rolls C Sal ammoniac is the principal ingredient of the flux, which is allowed to partly cover the Through these rolls the sheets rolls. are forced down into the metal and are made to follow the curve of cradle D, which is submerged in the pot. When the sheets pass upward from the pot through a layer of burnt molding sand or coke dust which lies on the surface of the metal they are caught between pegged rolls E, which impart to the sheets an impression that causes an even spangle by subsequent action of cold air. Following the guide F, they fall upon link belt conveyer G. In the intervening space between the metal pot and straightening machine a boy stands whose duty it is to sweep away the particles of dust remaining on the sheets and guide them into rolls at the point II. The force of these rolls passes the sheets between brushes I and on through straightening rolls J. These rolls will level any sheets that have not been badly buckled in rolling and pass them along to the conveyer, by which means they may be carried an indefinite distance, the usual distance being about 100 feet. At the end of the conveyer two pots, single turn, as shown by their positions in Fig. 1, would be 15, including superintendent or forcman. This is in comparison with at least 20 required in the old process for a much smaller daily output and more extravagant use of metal.

#### Quantity of Coating.

The quantity of metal used to galvanize a sheet of iron under the old process of working has been reduced by minor improvements to about 21 ounces per square foot of surface, but a great deal of this metal (spelter) adheres to the two lower edges of the sheets, which are taken from the pot diagonally by means of a rope and pulley. In the roller pot process the quantity of spelter required has been reduced to 2 ounces per square foot. At the same time, experts claim that the quality of the sheets is equally as good as those made by the old process, for the reason that all the metal is on the surface of the sheets evenly distributed and there are no lumps or rough edges. Tais is a point in favor of the improved process which both manufacturers and consumers will appreciate. The manufacturer will be

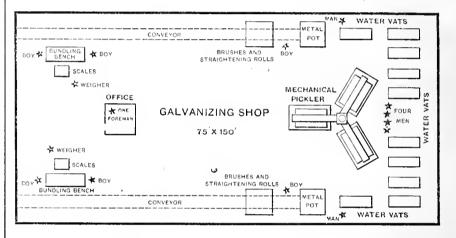

Fig. 1.-Ground Plan of Galvanizing Shop.

the sheets are taken off, inspected, bundled, weighed and branded and are ready for shipment.

An adjunct to this arrangement is the blower K suggested, but not always used excepting when a short conveyer makes it necessary for cooling the sheets. Ordinarily the sheets are sufficiently cooled without its use after they have traveled 100 feet at slow speed.

From the foregoing explanation it will be noticed that a great saving is effected by this process. The sheets are passed to the metal pot direct from the water vat, and the use of a drying oven is dispensed with and less manual labor is employed than in the old dipping process.

#### Labor Saving Features.

There are no improvements in machinery and appliances which command as much attention nowadays as those which tend to lessen the amount of labor required to perform work in a satisfactory manner. In this respect the Bayliss machine makes considerable saving. In the old method none but strong, healthy men can be employed, as it is necessary for them to stand over the metal pot in close proximity to the fumes of burning coke to perform their work. In the new process the labor is not so arduous and fewer men are required. The number of men and boys required to operate a shop containing glad to avail himself of the economy of metal and the consumer will find it easier to work sheets with smooth, even edges. The best results obtained in the use of the new process in Great Britain have already been equaled in this country, but it requires the very best of management and military precision in the actions of the men to produce them. In Great Britain it is customery to use a pair of cold chilled rolls about 18 inches diameter, run in ordinary housings in front of the metal pot. These rolls close up the pores of the sheets and effect a saving in the quantity of metal used. As competition becomes keener American manufacturers may resort to the same expedient. In this method of working results obtained are as follows:

To illustrate the difference effected by the use of cold rolls the result of a trial is here recorded:

#### Without Cold Rolls.

THOUSE COME 2100	•
34 sheets No. 26, 30 x 96 inches.	Pounds
Galvanized weight	
Black weight, not pickled	541

Gain..... 69

#### With Cold Rolls.

4 sheets <b>N</b> o. 26, 30 x 96 inches.	_	
Galvanized weight Black weight, not pickled		 inds 619 554
Gain		-

N B.-Loss in pickling is also added to spelter consumed

In galvanizing 34 sheets there was a gain of 4 pounds in favor of the use of cold rolls. The test was made without any screw pressure on the cold rolls. The only pressure was the weight of the top roll. In this instance the coat-

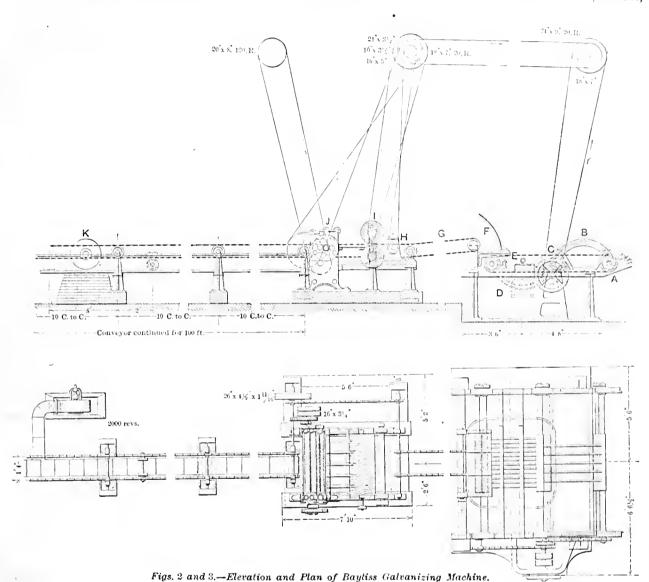

will tend to show the care with which galvanized price-lists are compiled.

Another matter which needs careful watching is the waste in pickling. In England muriatic acid is used almost exclusively. Americans use the weaker sulphuric acid, so results cannot be fairly compared, but the loss in pickling would probably be very nearly the same. Following are some results, same basis as above table, actual weights:

evenly distributed will produce a sheet of first-class quality.

Such are the facts, carefully gathered, in regard to this important improvement in the art of galvanizing.

The Paris correspondent of the Lon don Economist writes that the Customs Committee of the French Chamber have under examination a demand from owners of lead mines in France for a duty of 50 francs (\$10) per ton on lead, which is now on the free list. The production of lead in France is under 10,000 tons,

ing was remarkably light and shows what can be done with this process, but it is to be hoped that American manufacturers will not attempt to attain it.

Those engaged in the manufacture of galvanized sheets and those who are seeking information regarding it will be interested in the following figures showing actual results obtained by a well known English concern who have a high reputation for the quality of their goods.

Iron and Spelter Required to Make 2000 Pounds of Galvanized Sheets.

Weight of black	No. 20.	No. 24.	No. 26.	No. 28.
sheets	1,875	1,825	1,768	1,725
by zinc eoating	125	175	232	275
Total nounds	2.000	2.000	2.000	2.000

The proportionate increase in weight of metal required to coat various gauges

Pickled	1,825	1,763	1,688	1,638
Total gain	175	237	312	362
Total pounds	2.000	2.000	2,000	2,000

Materials Used for 2,000 Pounds Galvanized Sheets.

	No. 20.	No. 24.	No. 26,	No. 27.
	ъ.	10-	Tb.	m.
Zinc	175	237	312	362
Sal ammoniac	11	13	16	19
Muriatic acid	350	400	450	500
Coke, 50 pounds	to the	ton of s	sheets.	

The result of a test on No. 26, 30 x 96 inches, was as follows:

	Pounds
	persbeet.
Weight of black	14.125
After pickling	13.5
After galvanizing	
Zinc coating	21/2

It will be seen that to coat 20 square feet of surface  $2\frac{1}{2}$  pounds of spelter were consumed, an average of 2 ounces per square foot, and this quantity of metal

and the consumption averages \$90,000 tons yearly. The mine owners argue, however, that without the duty French mines must be closed and France be at the mercy of the foreigner for all the lead she requires.

Chief Constructor Hichborn, of the Navy Department, is carefully considering a proposal for sheathing the new ironclads, in order to prevent the fouling of their bottoms.

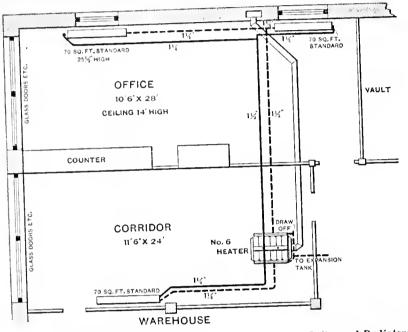

The directors of the Street Railroad Company of Montreal and the post-master of that city have srranged for the inauguration of a system of mail carriage by electric cars from one part of the city to the other. Special mail cars are to be built, each to contain a staff of clerks, who will sort the mail on the way to and from the various city suburbs.

# STEAM AND HOT WATER.

### Heating on Boiler Level.

The small and interesting hot water heating plant, shown in the accompanying illustrations, is in operation in the office of M. Drane & Son, Corsicana, Texas. A Royal hot water heater is used, the plant being designed by W.

1½ inch flow main leading from the heater to a point where it branches into two 1½-inch flow mains, running to and connecting with each of the radiators. The pipe in each case has a fall from the top of the heater to the radiators, the returns likewise descending toward the heater to a point where they rise and connect with it. Fig. 2 presents

Heating on Bailer Level .- Fig. 1.-Plan Showing Location of Bailer and Radiators.

M. Mackay, at the New York office of Hart & Crouse, Utica, N. Y. The office occupies the southwest corner of a large warehouse building, the easterly exposure of which is mainly of glass. The plant was designed to supply a temperature of 75° with the outside temperature at 15° above zero. There being no basement the boiler was set in the corridor on the same level as the three radiators to which it is connected,

an elevation of the radiators and piping in the office, also showing the method of connecting the flow main, in which an elbow and quick closing angle valve were employed, instead of making direct connection with radiator and using a gate valve. The returns from the radiators travel above the floor to a point where they run over to the heater, dropping down and connecting, as shown. Fig. 3 shows an elevation o

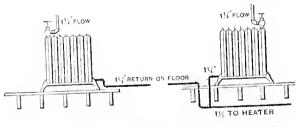

Fig. 2.—Showing Office Radiators and Their Connections.

the flow pipes being below the ceiling and the returns under the floor of the office. Fig. 1 shows a plan of the office, indicating the location of the boiler and radiators and giving the sizes of the pipes used. A Standard radiator containing 70 square feet of surface is placed in the corridor and is supplied by a 1½ inch pipe from the boiler, the flow pipe connection to the radiator being made on the top. Two Standard radiators, with 70 square feet of radiating surface, are located in front of the windows in the office proper, a

the expansion tank with the flow pipe branches. A ½-inch air pipe is taken from the top of the flow main, where it branches and is carried into the expansion tank, providing for the escape of air that may accumulate in the system. A 1-inch expansion pipe leads from the tank and is connected at the bottom of the heater at the back, as is shown in Fig. 1. The plant was put in operation last fall and after testing it during the winter Mesers. Drane & Son have written expressing entire satisfaction with its operation.

#### How Shall Radiators be Vented?

From A. P., Pennsylvania. — Will some of the practical readers give their experience with hot water systems hav-

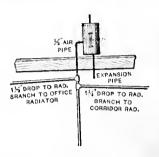

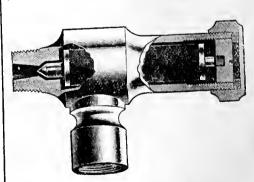

Fig. 3.—Showing Expansion Tank and Cannections.

ing air pipes from all radiators run to or above the expansion tank? Is it advisable to run air pipes from direct radiators when the ordinary air valve can be used?

# The Monash Automatic Steam Air Valve.

The Monash automatic steam air valve, herewith illustrated, is claimed to possess several particular advantages. The first feature to which attention is directed is the metal conical valve seat with a guide which insures positive action, the maker claiming that this is particularly durable. There is also an improvement in the mechanical construction of its adjusting screw. As will be noticed, it is separate and detached from the vulcanite and the adjustment in the valve can be made with-

The Manash Automatic Steam Air Valve

out turning the vulcanite on the valve seat, so that once the valve has made its seat it will not be disturbed. This valve is intended for use with drip pipe connections and also with drip cups. The valves are manufactured and sold by the Van Auken Special Company, 201-207 South Canai street, Chicago, for which Charles P. Monash is manager.

#### HEATING NOTES.

THE LAST TWO ISSUES of the familiar scarlet colored pamphlets descriptive of the Richmond heaters for stesm and hot water are published in the interests of Frank I. Lesard & Co., Manchester, N. H., and Henry W. Peabody & Co., export agents, New York, London and Australia.

THE SMITH & WINCHESTER COM-PANY, Boston, state that the Winchester steam and hot water boilers are being well received by the New England heating trade. The ease of setting is a strong argument in their favor. A hot water boiler of this type has been used to heat the residence of Charles Zerra at Melrose Highlands.

THE MAGRE FURNACE COMPANY, Boston, placed the first sample of their Magee hot water boiler on the floor of their show room last week. The apparatus has been brought out to meet the demand for a more powerful hot water heater, adapted for use in cases where their combination hot water and hot air constructions prove inadequate. The new heater possesses some novel constructive features, which will be fully described in a circular now in course of preparation.

THE WALKER & PRATT MFG. COM-PANY, Boston, report a good demand for the Crawford steam and hot water boilers. They also refer to the fact that for heavy duty their Commonwealth steam and hot water heating apparatus is giving exceptional satisfaction.

THE UNITED STATES HEATER COM-PANY have arranged with Janes & Kirtland for room to display their line of hot water and steam heaters, and desk room for their New York representative, J. L. Saunders. The trade will bear in mind, therefore, that hereafter samples may be seen at 110 Beekman street, New York, and communications sent to the United States Heater Company, at that address, will receive attention.

M. Mahony, Troy, N. Y., continues the publication of monthly calendar sheets, which are of service for office use, and at the same time keep the receiver in mind of the Mahony boilers for steam and hot water heating. The decoration of the latest card, which is for August, is particularly refreshing in this westher, being a sea scene with a bathing costumed young woman at the side.

THE FIRM OF WRIGHT & OLSEN have just started in business as the successors of Taylor Goodrich, 27 New Montgomery atreet, San Francisco, Csl., who has for msny years been identified with the stove and heating appliance trade. The new firm consists of W. H. Wright and O. F. Olsen. Mr. Wright, the senior partner, recently went to San Francisco from the East, while Mr. Olsen has been connected with Taylor Goodrich for over seven years. In the stock carried by the new firm are the Magee ranges, stoves and furnaces. Wright & Olsen are now prepared to contract for ventilating and heating residences, schools, churches and public buildings by hot air, steam or hot water.

"We have the pleasure of serding one of our vest pocket memorandum books which served as a souvenir at the Master Plumbers' Convention," is what the Detroit Heating & Lighting Company of Detroit say in a letter accompanying a memorandum book, bound in calf with celluloid inset, bearing an il-

lustration of the Bolton steam and hot water heating apparatus. On the back cover is shown a view of the Ploneer combination gas machine, while inside the front cover is a calendar for the year, the pages forming the body of the book being blank for memorandum purposes.

"WHAT'S YOUR PLEASURE?" SAY the American Boiler Company, in a very neat little circular just out. Other inneat little circular just out. terrogatories follow, bearing upon the heating line, which are duly answered by referring to the 182 different types of steam and hot water heaters which they manufacture, also the fact that they sell radiators, pipe, fittings and everything else needed to complete a job, backing it all up with the clincher that they have had long experience and never fail to please. Their Chicago office is at 84 Lake street, and New York office at 94 Centre street. Under date of August 1 the company issue a circular letter calling the attention of the trade to infringements on their Spence boiler, and stating that they own and control all the original patents covering the most essential features in the internal construction of the genuine Spence boiler pertaining to the water post which makes each section independent of the others.

The Niagara Radiator Company of Buffalo, N. Y., have opened a branch house at 93 Lake street, Chicago. It is under the management of T. J. Haywood, who was connected for five years with the American Radiator Company and their predecessors. The location of the Chicago branch is in the beart of the heating trade district in the Tremont House Block. It is the intention of the company at an early day to carry a stock of their radiators in Chicago, in order to promptly supply the trade. They have issued an exceedingly handsome circular illustrating and describing their new three-column radiator.

THE BOYNTON FURNACE COMPANY. 195 and 197 Lake street, Chicago, and 207 and 209 Water street, New York, have issued a Western edition of their catalogue of hot water and steam heaters. In it they illustrate and describe a variety of constructions suitable for any character of service. The largest hot water heater shown is their No. 5, The largest return flue heater, which has two feed doors, a grate surface 42 x 66 inches, a fire surface of 340 square feet, and a capacity for 5500 square feet of direct Other water heaters shown radiation. are the sectional return flue bard coal heater, the sectional return flue stcam heater, the soft coal sectional cast iron return flue hot water heater, the Niagara water heater and the Nisgara steam heater. Each of these is illustrated by perspective and sectional views and its special adaptabilities and advantages are fully set forth. Their sizes, capacities and prices are grouped in tabular form on a separate page, thus enabling comparisons to be easily made. A short treatise on hot water heating is given, and directions follow to fitters for setting the Boynton hesters. Eighteen pages are devoted to testimonials and references, covering covering customers in 35 States and Territories.

John Young, formerly with the Herendeen Mfg. Company, Geneva, N. Y., is now connected with the W. H. Page Boiler Company, Norwich, Conn., where he will have full charge of the business affairs of the company.

W. F. WESSEL, Peekskill, N. Y., was a vistor at the New York house of the

Gurney Heater Mfg. Company this week-He has set a number of the Gurney hot water heaters in his vicinity and will set more this fall.

J. B. BERNHARD, Jr., who has been traveling in the West for Hart & Crouse, will now remain at the Chicago salesroom, 79 Lake street.

The Bantam Game Oll Heater.

The accompanying illustration shows a new oil heater that is being put on the market by Sam S. Utter, New York, intended for use as a bathroom heater or for heating other small rooms. It can also be used as a lamp by unlocking and lifting off the heating section and substituting a glass chimney. The lamp section is handsomely designed and made of nickel plated brass and is con-

The Bantam Game Oil Heater.

structed on the central draft principle, giving a circular fiame of good heating and lighting power. The air enters the heating section through the center of the burner and close to the outer surface of the fiame, a circular plate being used to accomplish this result. This plate gets very hot, and the air which enters the perforations of the body support strike it first. The body or heating section is made of planished sheet iron and ornamentally perforated at the top and bottom, the bottom perforations being covered with mics. A decorative cover rests on the top of the stove, and when it is lighted it presents a cheerful appearance and gives a strong heat.

THE LOWELL HEATING AND PLUMB-ING COMPANY, which recently opened a place of business at 43 East Pine street, Lowell, Mass., have been obliged to seek larger quarters. A large store has been leased, numbering from 828 to 836 Middlesex street. D. W. Mullin, formerly with D. H. Wilson & Co., is manager. The firm makes a specialty of remodeling old plumbing and heating plants.

# PLUMBING and GAS FITTING.

Monmouth County, N. J., Plumbers.

State Vice-President John Hickman of Paterson, N. J., is sending the following letter to the plumbers of Mon-

mouth County, N. J.

"You are cordially invited to be present at a meeting of the master plumbers of Monmouth County, on August 10, at Monmouth Trust Company Building, at Asbury Park, at 8 o'clock p.m., for the purpose of forming an organization to be known as the Master Plumbers' Association of Monmouth County, N. J. There will be a number of prominent master plumbers present to speak to you, including John Mitchell, president of the National Association of Master Plumbers of the United States, and a pleasant and fraternal time is promised to all. The objects of organization, which is the principal idea of this meeting, are many and obvious. It is with the desire of uplifting our trade in the eyes of the public, bringing it on the same social plane as the physician, and giving it that recognizance which as a profession it is entitled to. It is also the means of bringing our craft closer together in a fraternal spirit. Master plumbers' associations becomes and deviated in ternal spirit. Master plumbers' associations have organized and flourished in all cities of the United States to-day, and why should we be behind hand? Sanitary laws are being passed by our trade everywhere, instilling the public with an idea of better plumbing, and the plumbers of Monmouth County should certainly derive the same benefits from the formation of an organizafits from the formation of an organization that our trade is receiving through-out our grand country."

The committee who will aid in the work are: T. D. Bazley, Long Branch; B. Crowell, Asbury Park; Wm. McMa-

hon, Red Bank.

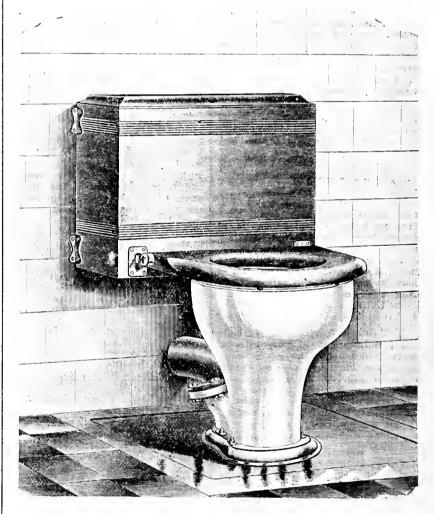

In the work of organizing the State, Mr. Hickman is ably assisted by Alexander Don of Newark, N. J. They will work together to organize an association in Union County at an early date, after which they will endeavor to effect an organization in Jersey City, Trenton and Camden, and a meeting to form a State Association is being considered with the probability that it will be held some time in September.

#### The Puritan Wash Down Closet.

The accompanying Illustration shows the Puritan wash down closet, just put on the market by the Dalton-Ingersoll Company, Fort Hill Square, Boston, Mass. As will be seen by the engraving the flush tank sets directly on, and not high above, the hopper, as has been the custom heretofore. The closet has the custom heretofore. The closet has a large standing pool of water, 3 inch depth of seal and a full 4 inch outlet, and is adapted to be placed almost anywhere, the top of the tank being Lut 2 feet 6 inches from the filor and the front of the closet 2 feet 13 inches from the face of the wall. The complete apparatus, it is stated, occupies no more space than a closet of the ordinary con-struction, besides saving the wall surface required when a flush tank of the common type is employed. It has a larger outlet than is found in siphon closets; fewer bends; is, it is said, not liable to stoppage and is clean, all the flushing water passing through the bowl. From the slight elevation of the tank the operation of flushing is almost noiseless. It is also stated to be inexpensive in setting as the flushing and supply pipes are dispensed with. The makers furthermore guarantee the closet

Newark Plumbers' Field Day.

July 27 found many of the plumbing shops at Newark, N. J, closed in honor of the first annual excursion and field day of the Master Plumbers' Association of Newark, N. J., to Pleasure Bay. About 100 men formed in line before Association Hall, with Grand Marshal W. Zeliff at their head, and to music by the Voss Cornet Band, marched to the station, journeyed to New York and by

Puritan Wash Down Closet.

for a term of three years. It is made in three styles, the cheaper grade being adapted for use in places where the commonest fixtures have previously been employed and can be operated by the seat, as shown, or by leverage. The back part of the seat is slightly raised and connected with the flushing valve. On being used the seat drops on the closet for support and on being released the valve is tripped and the closet is flushed.

J. SPENCER of the firm of Adams & Spencer, plumbers, tinners and steam and hot water fitters, was one of the visitors among the trade in the vicinity of Beekman and Water streets, New York, this week.

steamer from there to Pleasure Bay. At New York, State Vice President John Hickman headed the Paterson delegation, composed of ex Alderman J. Kearney, I. H. Voorhis, James H. White, Frank Mead, James Gillespie, Robert Beaumont, Adam Fritz, D. J. Roegiers, T. C. Cooper, Robert Davidson, U. C. Lendrum, Charles Walz, Adolph Weber and Peter Spear. The face of the gental secretary, J. T. McNabb was missing to the regret of all who sympathized with him in the recent lose of his vife. Lavi McRide. recent loss of his wife. Lavi McBride was also detained by sickness in his family, and in consequence a feature of the amusement was withheld for another opportunity.

Plumbing Inspector L. Balbach and

Francis Lang represented Orange, and Plumbing Inspectors W. H. Grier and J. B. Sullivan of Newark were also present. President Berla was accompanied by Charlea Bond, Joseph A. Smith, William Jacobi, E. J. Leonard and Ira Budd, the officers of the asso ciation. The Committee of Arrangements were William Jacobi, F. J. Sturn, Ira Budd and George Bauman. handsome souvenir was distribued, giving the names and half tone portraits of the officers and the committee. A brief history of the organization was given, with some humorous matter and advertisements of the trade. Dubois & Darragh were represented by ex-Sccre-tary Alexander Don and C. P. Vanderveer; Chemical Pottery Works, Brooklen, N. Y., by Thomas Milford; Henry McShane Mfg. Company by J. T. Myer. The Newark houses represented were V. E. Egbert & Co., Essex Lead Works, Passmore & Meeker, Bannister & Pollard, Macknett & Doremus, Roe & Conover and Hunt Brothers, while New York sent representatives from Jenkins Bros., Boynton Furnace Company, Thutcher Furnace Company, Richardson & Boynton Company, Fred Adee & Co. and C. F. Gessert.

After a pleasant sail down the bay a landing was made, and headed by the a randing was made, and headed by the band the plumbers marched to the Portau-Peck Hotel at Pleasure Bay, where mine host J. H. Wardell made firm friends of all his guests by serving a most delicous clambake and fish dinner. Two games of ball were played, the contestants being the Paterson and Newark Plumbers, Paterson carrying off the honors in both games, the score in the morning game standing 7 to 6, and in the afternoon 20 to 6. The The entertainment of the day included humorous remarks by marb'e dealer Hunt, and songs by L J. Parks.

At 6.30 o'clock the plumbers and their guesta left Branchport on a special train for home, the affair being voted a

general aucceas.

#### Water Main Tapping Machine.

The illustrations presented herewith show a machine for tapping water mains made by the Burritt Mfg. Company, Havemeyer Building, 26 Cortlandt street, New York, whose works are at Bound Brook, N. J. Fig. 1 shows the machine as attached to the main for making a single branch. sleeve is connected around the main and made tight by means of lead packing well calked. To this sleeve is | from the flange on the gate valve and

view of the machine as connected with the main, showing the drill point which drills a hole in the main. Fastwhich drills a hole in the main.

sired, after which the water may turned on or shut off by means of the valve at pleasure. Fig. 3 shows the

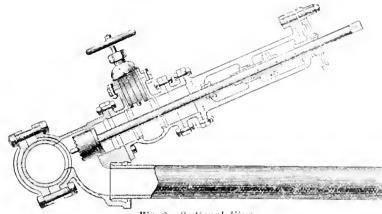

Fig. 2.—Sectional View.

ened to the drill shaft is a cutter which is made any size from 2 up to 48 inches in diameter, according to the size of the hole that is desired in the main. With the machine a branch can be taken from a main the same size as the main. This drill point and cutter bar are operated by means of a ratchet After the outer cutter has made a clean hole in the main the piece that

is cut is drawn out with it beyond the chine removed. Fig. 2 shows a special gate valve, after which the valve is sleeve by which the branch main may

Fig. 4.—Showing Branch Complete without Gate Valve.

The cutter is now unbolted closed.

Water Main Tapping Machine. - Fig. 1. - Machine Attached to Main.

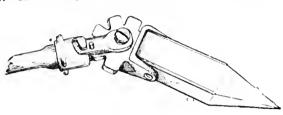

joined one of their roller wedge gate | valves, which has a flange face on one end to which the tapping machine is attached to the gate valve and the work connected. Fig. 2 shows a sectional of laying the pipes continued as de-

disconnected with the loss of but little water. The branch main may now be attached to the gate valve and the work he connected to the main previous to the main being tapped, and shows how a branch may be laid without leaving a gate valve in the branch connection, which is a very substantial saving in the cost of a water works plant. After having made the sleeve water tight and the branch main secure throughout its length, the wedge valve is connected to the flange in the usual manner and the main tapped. The cutter is then withdrawn and the gate valve closed, when the machine is disconnected from the gate valve, as shown in Fig. 3. sleeve is then bolted to the valve which has within it an expansiou cylinder around which is a rubber gasket. The gate valve is then opened and this is inserted in the recess in the upper opening of the branch sleeve and expanded, making the connection perfectly water The gate valve is now removed from this branch and an iron plug put in outside of the gasket and the lead packing calked secure to make a permanent stop. Fig. 4 shows the branch complete without the use of a gate

### Adjustable Soldering Iron.

The accompanying cut illustrates the adjustable soldering from made by H. Beutelspacher, Bridgeport, Conn. The special feature of the iron is that it may be turned and held at any angle. To hold it in position the loose collar is pushed forward until it engages the notches at the top of the bit. The collar is then partly rotated until the hook catches over the pin shown at the side of the handle. In this way the bit is

of oblong shape, is bound in pebbled cloth, has flexible covers, contains 73 pages and is printed on a fine grade of paper. The alphabetical index in the beginning indicates the extensive variety of articles included, which is followed by a telegraphic code, and then comes the catalogue proper with its muititude of fine engravings. The articles embrace a full line of brass goods for water and gas companies, the first noted being bibba, then stops, cocks, filters, couplings, hose pipe, nozzles,

Adjustable Soldering Iron.

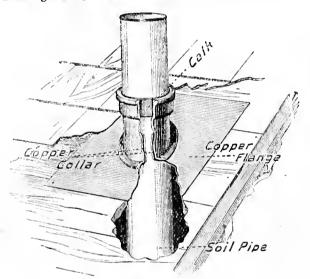

firmly held in position for use. When a new position is desired the soldering iron is readily readjusted.

### The Hub Roof Flange.

Through the courtesy of King & Goddard, 66 Pearl street, Boston, Mass., we are able to present an engraving of the Hub roof flange, manufactured by F. R. Nies & Co., Lynn, Mass. The device is a hub, sleeve and flange combined, enabling the plumber to make a perfectly tight joint where the soil or ventilating pipe runs through the roof. The hub is a casting resting on a cop-

hose clamps, valves, compression cocks, hydrant work, service cocks, meter eocks, brass fittings, pipe, cast iron fittings, malleable iron fittings, stocks and dies, cutters, &c.

FRANK A. WENDELL entertained the members of the Master Plumbers' Association of Salem, Mass., last Saturday. The party left the Willowa in two steam yachts and went out to Half Rock, where fishing was enjoyed. Baker's Island was the next point of interest, and here the party had a fish dinner. Two nines were then picked up from those present and a ball game passed away a few hours. Embarking again

The Hub Roof Flange.

per flange, adapting it for use under a shingle or slate roof, as shown, or for soldering fast to a roof of tin. The soil or ventilating pipe can be run up through the casting, calked with oakum in the usual manner and lead poured on top and calked, rendering it water tight. The hub is made in four different angles of 5, 15, 30 and 45° and 5 different sizes, 2, 3, 4, 5 and 6 inches.

### TRAPS AND VENTS.

THE CATALOGUE of water and gas works goods issued by Peck Brothers & Co., New Haven, Conn., is an extremely neat publication, in keeping with the other catalogues and circulars distributed by this well known firm of manufacturers. The pamphlet, which is

on one of the yachts a cruise was made to Gloucester, where everybody took a look at the old town. On the way home, when about 3 miles outside of Baker's, the party was overtaken by the storm. The little steamer was immediately headed for the fishing schooner "Minnchaha" of Swampscott, whose genial captain took all on board and furnished supper, after which he gave them possession of the ship. A lively time was enjoyed with songs and story telling until the storm had passed.

THE DALTON-INGERSOLL COMPANY, Fort Hill Square, Boston, Mass., are one of the progressive plumbing supply houses, and in addition to carrying everything required in their particular line, bring out from time to time specialties. They are now putting on the

market a wash down hopper closet with a low down tank, which, it is claimed, can be set with some saving in expense and give a perfect wash with ne back action.

CRAWFORD & Youne, Bosten, are about completing the plumbing work in Waverley Hall, a new students' dormitory at Cambridge. This contract includes 60 bathrooms and a swimming bath. The fixtures were supplied principally by W. B. Hubbard, manager of the Besten house of Peck Brothers & Co.

THE PLUMBING SYSTEM in the Flushing, L. I., High School Building is being examined with a view to having it put in a sanitary condition. It has been discovered that none of the water closets are "back alred."

The New LAW in Massachusetts regulating the plumbing business, which went into effect July 10. allows unregistered plumbers until September 1 to register and take out licenses. Under the old law only those plumbers not in the business previous to July 10, 1893, were required to register, but now all plumbers must be registered. Any unregistered plumber who does a job after September 1 is liable to a \$50 fine.

THIEVES have been successfully robbing some houses in New York by the old game of telling servants that they have been sent to make some plumbing repairs.

THE MANUFACTURE OF SLATE GOODS for plumbers' use is a branch of the business of the Monson, Maine, Slate Company of Boston. They are wel, equipped to furnish urinal stalls, sinks, wash trays, laundry tubs, lavatory slabsr flooring and wainsceting, made of thei fine grain unfading slate. They carry in stock a full line of standard goods, but orders are promptly filled for goods of dimensions to meet irregular requirements.

THE EXAMINATION OF PLUMBERS by Plumbing Inspector Tower of Springfield, Mass., will henceforth be conducted according to the law recently passed requiring a practical test of efficiency. The first examination under the new law was held last week.

MONTEITH, DEMPSEY & Honer is the title of a new plumbing house located at 151 Seventh atreet, Dubuque, Iowa.

WM. H. Long has engaged in the plumbing bustness for himself at his residence, 615 Seventh street, Huntingdon, Pa.

THE PLATT-BROOKS PLUMBING COM-PANY are among the new enterprises recently established at Little Rock, Ark., and have opened up business at 205 West Second street. The firm consists of E. C. Platt, who was for years in the plumbing business at Niles, Mich., and W. Burt Brooks, a wellknown plumber. The company will take contracts for plumbing, gas fitting and steam and hot water heating.

O. S. Kelsey died auddenly in Middletown, Coun., from rheumatism of the heart. Mr. Kelsey was in the plumbing and stove business in Hartford up to eight years ago, when he retired. Five years since he went to Middletown, where he entered the employ of Bailey & Stothart, plumbers, taking charge of their business.

An interesting case was recently tried at the Court of Special Sessions, involving an infringement of the New York plumbing laws, the ergineer of one of the large hotels being convicted

and fined \$25 for doing plumbing without a license. After his arrest he started a shop in the basement of the hotel and applied for a certificate of competency from the Board of Examiners, which was refused as he was unable to qualify. This case will have an important bearing on many of the large hotels, apartment houses and other buildings employing janitors and engineers, who in the course of the year do considerable plumbing work, especially in the way of repairs and extensions of existing systems.

THE SMITH & WINCHESTER COMPANY of Boston, in addition to two large five-story buildings in the city, have a large warchouse at South Boston, to which the railroad runs a siding. Here is carried their heavy stock of soil pipe, larger sizes of wrought iron pipe and fittings and all the appurtenances of the Dandy windmill, with which they do a large trade in New England. Their showroom presents a great variety of

They recently supplied to Alfred Provost all the materials required for plumbing the City Orphan Asylum, at Sa'em, Mass., their special hopper and trap closeta being used, the materials alone amounting to nearly \$5,000.

DAVID M. CONNELL has opened a plumbing establishment at 5 Spring street, Fall River, Mass.

The Crane Company of Chicago have just issued a ten-page catalogue of cast iron drainage fittings. With the introduction of the wrought iron pipe system of drainage came the necessity of a line of fittings especially adapted to its requirements. To meet this demand the Crane Company have made patterns for a great variety of fittings shown in this catalogue, as follows: Elbows of 90°, 60°, 45°, 22½°, 11½° and 5½°, 90° and 45° long turn elbows, tees and reducing tees, three way and reducing three way elbows, Y branches of 90°, 60° and 45° and reducing Y branches, double Y branches, increases.

#### Enterprise Gas Radiators.

Two new gas radiators are shown in the accompanying illustrations, that are being manufactured by Luther & Lederhos, 30 Cliff street, New York. Fig. 1 shows a radiator with horizontal heat tubes, supported by columns resting on a nickel plated base. In the bottom of the base a planished copper reflector is placed, over which is suspended a burner of the illuminating character, which is lighted by a door at the center of the base. The column at one side is not open at the bottom, and partitions are placed in both columns so that the products of combustion leave the base and pass up one column to the partition, which deflects their course through the heating tubes back and forth until the top is reached, where they find exit through an opening adapted for a chimney connection when desired. This radiator is de-

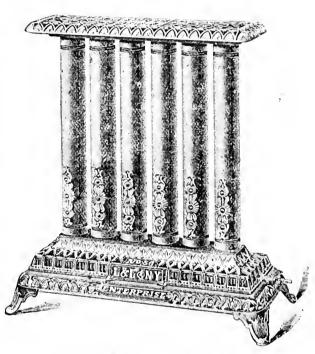

Fig. 2.-With Vertica! Heat Tubes.

### NEW GAS RADIATORS.

plumbing specialties in steel clad, enameled, roll rim and porcelain baths, besides a large and assorted line of water closets of the hopper, wash out and siphon jet character, as well as lava-tories of different styles and designs. An extensive line of nickel plated brass goods, such as are used in open work plumbing, are shown. These goods are displayed in cases against black velvet, presenting a very bandsome appearance. In cast iron fittings they carry a full line for stesm and hot water work, for all sizes of pipe up to 8 inches, and including an assortment of gate and globe valves, traps, pressure regulators, &c. One floor of the building is entirely devoted to pump repairs, the firm making a specialty of handling pumps of every character, from the popular New England copper pump and the well known cast iron pitcher pump toforce pumps and steam pumps for heavy duty. A feature of all the printed matter of this house is the use of the word "everything," the idea being to impress upon the trade the fact that they can furnish everything in the plumbing, steam, water and gas fitting lines, as well as earthenware, iron, lead, brasa and cast iron goods.

closet and reducing closet elbows, with one end flanged, 90° Y branches with auxiliary inleta, closet flanges, roof connections, cappings for air inlet pipes, S traps, half S traps, running trapa, &c. These fittings are made with a shoulder and are the same size inside diameter as the pipe. The pipe screws in up to the shoulder, making a continuous passage, leaving no pockets for the solid matter to lodge in, thus preventing the choking up of the pipe. The company state that when not otherwise ordered these fittings will be coated with heated asphaltum, excepting those for use in New York City, which will not be coated.

HILL & MOORE have opened a plumbing shop on the southeast corner of the square, Lima, Ohio.

P. L. Lyons & Co. of Montpelier are to open a plumbing shop in the Cushman Block, West Randolph, Vt.

J. A. CASLAKE, late of Dunsmore & Caslake, Stratford, Ont., has opened a tinsmithing, plumbing and steam and gas fitting establishment in the Odbert Block on Ontario street west, Stratford, Ont.

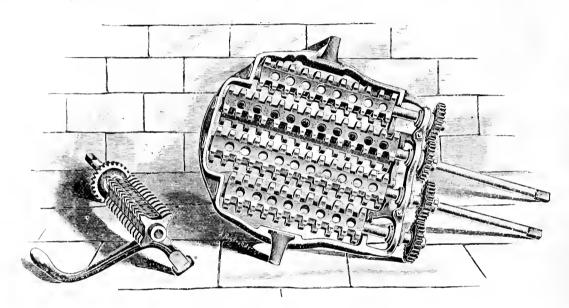

signed for a base heater, and in operation a strong radiant heat is given off near the floor and a good current of hot air rises through the ornamental top after having passed over the heating tubes.

Fig. 2 shows a radiator with vertical heating tubes running from the top to a base constructed with the same atyle of burner and planished copper re-flector. To facilitate the lighting of this radiator, a hood connected with the lighting door is drawn over the burner when the lightlng door is opened, then when the gas is turned on it is collected and all the burners light at one time. The columns connect into an ornamental top and are decorated with colored jewels in nickeled settings. The radiators are called the Enterprise, as is the line of gas ranges, hot plates and heaters made by the house. Both are made in three sizes, with four, five and six heating tubes, burning 25, 30 and 35 feet of gas per hour respectively, and said to have the capacity to heat rooms from 15 to 18 feet square. horizontal tube radiators are numbered 44, 46 and 48, the others being num. bered 52, 54 and 56.

## Economy Revolving Hollow Bar Grate.

The illustration presented herewith shows the construction and general features of the Economy revolving hollow bar grate, a new form of grate for which a patent has been applied for, and which is being introduced in the Economy furnaces and heaters made by the J. F. Pease Furnace Company, Syracuse, N. Y. The general features for which particular claims are made, is the large amount of air surface and the corresponding small amount of dead surface in the grate; the construction of the hollow bar so made as to make the liability of warping practically im-possible, and the fact that when the ashes are dumped into the pit there is an exceptionally small loss of fuel. Like the other Economy heater grates, the new one is suspended in the ash pit some distance below the bottom of the tire pot, so that a poker can be run over its entire face and ashes and clinkers removed. The bars, as will be seen by

Gas Flow Computer. It is a card some 10 inches square, mounted on a circular disk, outside of which an arc is fastened to the eard. The background of the eard reads, "Cubic Feet of Gas Per Hour;" the disk reads, "Diameter of Pipe in Inches," while the second small scale on the disk reads, "Pressure in Inches of Water" The arc reads, "Length of Pipe in Yards," and a smaller scale is labeled "Specific Gravity." The application of the computer is very simple, and is intended to show the number of cubic feet of gas per hour that would flow through pipes of certain diameters, certain lengths and under certain pressures. In using it it is merely necessary first to set the arc with the specific gravity of the par ticular gas under consideration oppo-site a fixed arrow. Next bring the pressure in inches of water opposite the leugth of pipes in yards, and then, reading across from the diameter of pipe in inches, the number of cubic feet of gas that will flow per hour will be seen direct. The diagram is worked out from The title of the appellant to this patent, and the utility of the invention it describes are not contested in this court. A glance at the claims of the patent is sufficient to show that unless they are restricted by the prior state of the art the appellees are infringers. It was not the mere form of the hinge described in the patent in suit that Selden & Griswold were seeking to claim. It was any hinge in a waffle iron which itself formed, or was provided with, one of the journals or pivots on which the pan was rotated. It was not a new hinge that they thought they had discovered or invented, but it was such an improvement in the construction of the waffle iron that the hinge could be placed in the same line with the axis of rotation of the pan, and at the same time perform the function of a journal for its rotation, while the handles attached to the pan opposite the hinge formed the other journal. It was the combination of the following essential elements that the patentees fairly described, claimed and sought to secure by their patent: A hinge to the pan located in the same plane with its axis of rotation, a hinge that was provided with a journal on which the pan might be turned; a handle

Economy Revolving Hollow Bar Grate.

referring to the smaller engraving at the left of the illustration, are each provided with four sets of prongs and revolve against one another so that any clinkers of ordinary size are caught and crushed. It is pointed out that in revolving, the bars cannot become so far separated as to permit the loss of fuel, as a moment's consideration will show that as the hollow bar revolves the aperture is much less with the four prongs to the grate than it would be with a triangular grate of the same diameter which has only three prongs. Because of this lesser opening the manufacturers point out that the waste of fuel is reduced. In the engraving the grate is shown with the bottom side presented to view, illustrating the bars and connections. The bars are perforated on all sides, and also lengthwise through the center, which construction, it is stated, prevents the liability of warping. Although each bar is honeycombcd, as shown, they are made with a proper regard to strength. If desired, the grate can be partly dumped without letting out the culire fire, in which lowered condition the larger clinker accumulations can be readily removed.

William Cox, Post Office Box 541, Stapleton, N. Y., has published a very interesting chart, which he calls Cox's Professor Pole's formula, and a number of testimonial letters from gas engineers apeak in the highest terms of its utility.

#### Wasle Iron Decision.

The Griswold Mfg. Company, Erie, Pa., are distributing as circulars extracts from a recent decision in their favor in a suit with John B. Harker & Co. respecting the construction of waffe irons. The decision was delivered in the United States Court of Appeals, Eighth Circuit, by Judge Sanborn, and was on an appeal from a decree rendered in the Circuit Court of the United States for the District of Minnesota, dismissing a bill brought by the Griswold Mfg. Company against John B. Harker & Co. for an infringement on the 6rst two claims of the patent on waffle irons granted in 1880 to Selden & Griswold. We print below the claims of the patent and quote a part of Judge Sanborn's decision:

 In a waille iron, the hinge upon which the pan opens, provided with one of the journals or pivots on which the pan is rotated.

2. The journals or pivots on which the pan rotates, formed upon or connected, one with the hinge upon which the pan opens, and the other on the handle for rotating and opening said pan. . . . .

to each half of the pan located directly opposite to the hinge and together forming another journal for the rotation of the

Turning to the prior state of the art, as it is disclosed by the record before us, we find that prior to the invention of these patentees the two halves of the double pan of a waffle iron were hinged together by a pin passing through two lugs or ears that projected from each half of the pan. Pindles projected from the double pan, on the sides of it relatively to the hinge, and at right angles to the plane in which the pan opened, and these pindles were journaled upon a supporting ring or frame in which the pan was suspended so that it could be turned upon the pindles. The pan was not provided with handles for turning it, but was made to rotate by pushing one side of it with a knife or some other itensil, and no pan of a waffle iron had ever been constructed, so far as this record discloses, which opened in the same plane with its axis of rotation, or which turned upon journals, one of which was connected with or formed the hinge, while the other was formed of the handles to the pan. In this state of the art the patentees made this invention. It is plain that there was nothing in the prior construction or use of waffle irons to restrict the claims of their patent.

or use of welle from to restrict the claims of their patent. . . . . . In our opinion, the first and second claims of the patent in the suit are neither anticipated nor restricted by the prior state of the art, nor by the patents pleaded in the answer, and the appellees are infringers of them.

The decree below is reversed with costs, and the cause remanded with directions to enter a decree in favor of the appellant for a perpetual injunction, damages and costs.

# ROOFING AND CORNICE.

The Piqua Metallic Lath.

The Cincinuati Corrugating Company, Piqua, Ohio, are now placing on the market the improved form of steel lath shown in the accompanying cut. The material used, it is stated, is the best grade of steel, in sheets 27† inches wide by 48 inches long, each sheet covering one square yard of surface. The sheets are traversed lengthwise at intervals of 31 inches by 4 inch corrugations, to provide great rigidity and stiffness to the entire sheet. Between the corrugations are formed a series of slots at right angles to the corrugations, the metal on either side of the slot being depressed into cup like shape, into which the mortar or plaster easily slides, and passing through forms a strong and perfect key, requiring less plaster than other forms of lath. It is pointed out that the Piqua lath requires no stretching, atiffening pieces, or staples for securing it to the frame work, common nails

awnings in that city has led to their growing adoption by storekeepers and others. Applications for permission to erect auch awnings are being received in large numbers by the Board of Highway Supervisors.

HILL & McGinty, 20-22 Pitts street, Boston, are a new coppersmithing and sheet metal house, who commenced business in April. They occupy a three story and basement building, the first floor being used as an effice and stock room. On the upper floors are located the workshops for the production of heavy copper boilers for kitchen use and sheet copper work for gutters, cornices and ornamental architectural copper work. Among the other goods produced by this firm are copper balls, such as are used with float valves, they being equipped with machlary for turning out balls having a diameter of 48 inches. They also manufacture flush tanks adapted for use with water closets.

Amono the contracts recently taken by James A. Miller & Bro., 129-131 South Clinton street, Chicago, can be mentioned the following: Six new skylights for Harrison Bros., for the Times Building; new cornice for the Atheneum Building; tile roofing and cornice work for the residence of J. W. Stevens, Grand Boulevard; tile and tin roofing for house and stable of Chauncey J. Blair, Drexel Boulevard and Forty-seventh street; repairs on roof of 19 school buildings for the Board of Education; copper cornice and skylights for building of P. J. Ryan, 310 Fifth avenue; slating and copper gutters for residence of D. B Jones, Lake Forest, Ill.

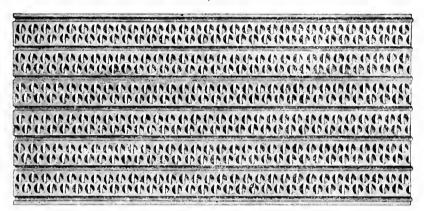

#### Correction.

In Chapter X of the article on Presa Working of Sheet Metals, published in The Metal Worker, July 28, there was a typographical error in the nineteenth line, second paragraph of the last column on page 33. The phrase as printed, "dividing the product by 4000" should have read "dividing the product by 1000."

Key West, Fla., will, in future, be a coaling station for the versels of the North Atlantic and Caribbean Sea fleet. Hitherto the Navy Department has ordered vessels cruising in the Caribbean Sea to coal either at Jamaica, Cartagena or Colon, where the price of bituminous coal ranges from \$9 to \$11 a ton. The same coal can, it is claimed, be put on board at Key West at a little over \$4. The saving will, therefore, be considerable.

In a recent issue we acknowledged the receipt of a series of unique blotting pads from Francis I. Maule of Philadelphia. These blotters illustrate in a novel and decidedly unconventional manner some of the capabilities of this method of advertising. Mr. Maule informs us that he will be pleased to mail this series of advertising blotters to any of our readers who will send their address to his offices, 328 Chestnut street, Philadelphia.

The Anglo-American Telegraph Company's new cable was lald in 12 days, the shortest time on record for such an operation. The steamship "Scotia," which started from Heart's Content, Newfoundland, on July 15, laid the deep sea section, and the "Britannia" the Irish shore section, a short one of 192 knots in length. The final splice was made on July 27. The whole operation was probably the most successful feat of cable laying ever accomplished, considering the size of the cable, which is the heaviest yet stretched under the Atlantic. The new cable is laid between Valentia, Ireland, and Heart's Content, Newfoundland. It contains 600 pounds of copper to the nautical mile, and has a larger conductor than any cable ever laid, which means a greater capacity and higher speed of transmission than any of the lay cables.

The Piqua Metallic Loth.

only being required for attaching it in position. It is remarked by the makers that while the lath is used quite largely in buildings of wooden construction, it is principally used in strictly fire proof buildings in connection with iron beams and furring, and that it is in such construction that the rigidlty and stiffness resulting from the corrugations make it epecially valuable, as the studding can be placed at least 2 feet apart, effecting a saving in the cost of studding. the lath is used in connection with iron, the usual method is to wire it into place. The manufacturers state that the lath is especially adapted to the use of adamant or patent plaster, and that the rapidity and ease with which it may be applied to round, aquare or angular surfaces, together with the fact that it affords a firm holding surface for the plaster, and its fire proof qualities, recommend its use in buildings.

#### FLASHINGS.

It is said the roof of the new Federal Building, in Wilmington, Del., which has just been completed, contains over 10,000 square feet of slate, a ton of lead and over \$1000 worth of copper.

THE RECENT PASSAGE of a law by the City Council of Philadelphia regulating the construction of galvanized iron

The heavy coppersmith work is done in the basement, where they have a plant for tinning copper kitchen ware. Mr. McCinty is an old and well-known architectural sheet copper worker, and has designed work for some of the handsomest buildings in Boston and vicinity. The concern are now engaged on a copper entablature for a fine building at the corner of Friend and Union streets, as well as the architectural copper work and skylight for the Telephone Building at Fall River.

BESIDES the metal work on the new Stratford Library and the Methodist Church at Derby, Disley & Weyand, Waterbury, Conn., have just put 35 ventilators on the new rubber factory at Naugatuck.

Behner & Norton, Hartford, Conn., are busy with heating and tinning contracts. They have the hot air heating in two houses for Clark & Loscher on Sergeant and Oxford streets, and have just finished a large roofing contract for Contractor Cook on the Abbe Building on Asylum street.

NICHOLAS ENNIS, a New York tinner, who was repairing a cornice on a building, accidentally broke an electric wire and was so seriously burned that he is in a critical condition.

# TIN PLATES.

American Tin Plate Production for Quarter, March 31, 1894.

The special report to the Secretary of the Treasury of Ira Ayer, special agent of the Treasury Department, relative to the production of tin and terne plates in the United States during the quarter ended March 31, 1894, with comparative statements of production, has been received at the Treasury Department and has been placed in the hands of the printer.

The following is a very full synopsis of the report. Colonel Ayer says:

I have the honor to report that during the quarter ended March 31, 1894, 36 firms manufactured 38,260,411 pounds of tin and terne plates proper, against an output of 27,351,241 pounds by 39 firms during the previous quarter.

Of the output for the quarter 27,765,-162 pounds, or more than 72 per cent., were made from sheets rolled in the United States, and of this amount 26,-382,273 pounds, or more than 95 per cent., consisted of the class of plates weighing lighter than 63 pounds per 100 square feet.

Of the commercial plates manufactured during the quarter 26,313,561 pounds were coated with tin, and 11,946,850 pounds were terne coated.

#### American Sheet Iron and Steel.

The quantity of American sheet iron and steel made into articles and wares, tinned or terne plated, was 2,162,889 pounds. This makes the aggregate output of tin and terne plate for the quarter from all sources 40,423,300 pounds; that of the previous quarter was 28,595,948 pounds.

The production for the quarter, subject to comparison with net imports under the Department's ruling, inclusive of products from American sheet iron and steel, tinned or terne plated, was 28,545,162 pounds, as compared with 16,553,716 pounds during the previous quarter.

The production for the three quarters of the fiscal year respectively, subject to such comparison, was as follows:

Quarter ended. September 30, 1893. December 31, 1893 March 31, 1894	16,5:3,716
Total nine months ended March	54.358.488

## Changes in List of Manufacturers.

The following companies made their first report of production to the Government, namely, The Chicago Stamping Company, Chicago, Ill.; George W. Jacques, New York City, and the Philadelphia Tin Plate Company, Phila-

delphia, Pa.

The Ena-Standard Iron & Steel Company, Bridgeport, Ohio, and the Elwood Tin Plate Company, Elwood City, Pa., were engaged during the quarter in erecting rolling mills for the manufacture of black plates. Their names, together with that of George W. Jacques, appear for the first time on the list. The works of Hughes & Patterson, as atyled in the previous report, appear under the name of the Philadelphia Iron & Tin Plate Works.

The Locust Point Iron & Steel Works Company, Baltimore, Md., has passed under the control of the Baltimore Iron, Steel & Tin Plate Company, and the

facture of tin and terne plates proper during the fiscal years ended June 30, 1892 and 1893 respectively, and the nine months ended March 31, 1894:

	Amount made from-

Totals	52,466,858	56.56	40,290,274	43.44	92,757,132

name of the former company has therefore been dropped from the list. Three firms suspended manufacture, additional to the six as shown in my last report. From three I was unable to secure any report.

#### Black Plate Product.

The production of black plates in the United States during the quarter was 30,070,701 pounds, and of this amount 23,514,881 pounds, or more than 78 per cent., belonged to the class weighing lighter than 63 pounds per 100 square feet.

The production of the previous quarter was 19,679,910, of which 17,197,664 pounds, or nearly 90 per cent., were of

the lighter class.

The production of American black plates of the class weighing lighter than 63 pounds per 100 aquare feet was 6,317,217 pounds in excess of that of any previous quarter since the law became operative.

Eighteen rolling mills made sworn returns of production, against 17 that made sworn returns for the quarter preceding.

#### Consumption of American Plates.

Of the 36 firms that made sworn returns of the manufacture of commercial tin and terne plates, 19 used wholly American plates, with an output of 19,552,682 pounds; 3 used wholly foreign plates, with an output of 3,020,992 pounds; 14 used both American and foreign plates, with an aggregate output of 15,686,737 pounds, of which 8,212,480 pounds were made from American black plates.

Fourteen stamping or other manufacturing companies that used American sheet iron and steel in the manufacture of articles and wares tinned or terne plated submitted sworn statements, as against 16 during the previous quarter.

#### Comparative Statements.

a. The following is a comparative statement, by quarters, of the manu-

b. The amount of American sheet iron and steel made into articles and wares, tinned or terne plated, during the same period was as follows:

Four questions Intel 1001 to Iuna	Pounds.

#### SCRAP.

JACOB MEURER of the tin plate manufacturing firm of Meurer Bros. Company, Brooklyn, has devised and constructed a labor saving machine by which the tlnned sheets, as they come from the cleaning and dusting machines, are cut, accurately trimmed and counted, and boxed. This machine will mark a distinct step in the progress of the American tin plate industry, and add another to the achievements in this line already made since the inauguration of tin plate manufacture in this country. The machine is, we understand, capable of disposing of the product of ten sets, and only requires the attendance of one boy to feed it with the tinned sheets. Mr. Meurer is now engaged in developing some further improvements in the line of tin plate machinery, designed to facilitate the handling and cleaning of the sheets.

IN THE TIN MILL of the Ætna Standard Iron & Steel Company, Bridgeport, Ohio, 150 men are employed, all of whom are American citizens.

J. H. ROOERS of the firm of E. Morewood & Co., who manages the firm's tin plate works at Gas City, Ind., is now in Wales.

A PRESS DISPATCH from Pittsburgh, Pa., reports that a fire, which occurred at the tin plate works of Griffiths & Cadwallader, Hazlewood, Pa., on July 18, did damage to the extent of **\$6000.** 

INCLUDED IN ORDERS for tin plate machinery recently received by the Leechburg Foundry & Machine Company of Pittaburgh, are three Mesta patent pickling machines. One of these is for shipment to Wallace, Banfield & Co., Limited, at Irondale, Ohio, which concern are making some improvements and additions to their plant with a view of considerably increasing their capacity. Another is for shipment to the Morton Tin Plate Company, Cambridge, Ohio, which concern are erecting a tin plate plant, while the third one is for

the Pittsburgh Tin Plate Works, Incorporated, New Kensington, Pa., this concern having now under erection three mills for rolling black sheets for tinning purposes.

THE WORKS OF JOHN HAMILTON, Pittsburgh, Pa., manufacturer of Hamilton's Best Redlpped American Roofing Plates, have been in operation right along, and the product is being sold as fast as turned out. The firm have some good sized orders on hand, and regard the outlook as very encouraging. The roofing plates made by this firm are giving excellent satisfaction, and the demand for them is constantly increasing.

MERRY & CLARK, 536-547 West Fifteenth street, New York, have built an additional story to their warehouse and have added an extension of 40 feet to their showroom, various sections of the new quarters being set apart for their leading brands of roofing plates, which include Merry's Old Method, Monarch Old Style and Merry's Lion. We understand that during the month of July they shipped over 4000 boxes of these plates.

### Trade Notes.

AN ANNOUNCEMENT of interest to the trade is made in our advertising columns this week by the Geuder & Paeschke Mfg. Company, Milwaukee, Wis. It relates to their Cream City Coal Hoda, an extra heavy line which they have brought out.

Wilson's Improved Air Tight Heater is illustrated and its chief tentures pointed out in the advertisement elsewhere of the Simmons Hardware Company, Incorporated, St. Louis, Mo. The stove is adapted to burn chips, shavings, bark, roots, corn cobs or cord wood.

THE ADVERTISEMENT of the Safety Furnace Pipe Company, Detrolt, for whom Riter Brothers, Philadelphia, are eastern agents, directs attention to Safety Furnace Pipe of their manufact-ure. The illustrations show Furnace Fittings, and it is pointed out in the text that their use saves money, time and trouble. They will send catalogue and price-list to those who apply.

THE RETORT Magazine Stove is illustrated in the advertisement elsewhere of the Marion Stove Company, Marion, Ind. The advantages of the stove are referred to and special emphasis is laid upon the fact that it will feed all kinds of soft coal.

THE WORRS of the E. W. Bllss Company, Brooklyn, N. Y., are running full time, with 460 men, and turning out a number of large orders for early shipment. They have shipped within the last two weeks the following of their new improved Trimming Presses for trimming drop forgings and heavy hardware: One 73½ press with cut off attachment; two 741 and one 75 presses. all for a large agricultural implement manufacturer; a 600 pound drop hammer and a 1500 pound drop hammer, taken by two large heavy hardware manufacturers, and a 400 pound drop hammer and a 31 toggle drawing press with a complete set of dies, both of which went to a lamp manufacturing concern in the East.

Mills Nos. 6 and 7 of the Whitaker Iron Company, Wheeling, W. Va., manufacturers of black and galvanized sheet iron, resumed operations last week, and will continue in operation as long as sufficient orders are received to keep

them employed. The new mills now under erection by this firm are expected to be in readiness for operations sometime during the latter part of August.

THE LEACH ROASTER & BAKER COM-PANY of Paxton, Ill., have just issued their first annual estalogue of the specialties which they manufacture. It comprises 24 pages of illustrations and printed matter, and is tastefully bound in a scarlet paper cover. In an introductory note the company state that they have found the publication of a catalogue necessary because they are now offering such a variety of articles. These comprise the Leach roaster and baker, the Travers improved roaster and baker, the Abell coffee pot, the Little Monitor tea and coffee cooker, the Magnet broom support, the egg and vegetable lifter, the Paxton separable bread and cake pans, the Lebanon beater, the Edgar grater, the Champion roaster, the Paxton stove pipe shelf, the new improved Perfection cake pans, Cook's rotary grater and slicer, the Perry separable cake pan, the Perfect eooking mat, Ristedt's combination holder, the Midget umbrella holder, the Buffalo steam egg poacher, Leach's stove pipe attachment, the Sensible mineing knife, the Lebanon cake cut-ters, and Dodge's cistern strainer.

THE COMBINED CLOTHES WRINGER & WASH TUB COMPANY were incorporated recently to manufacture Clothes Wringers and Wash Tubs in New York The capital is placed at \$25,000, and the directors named are Theodore Tottla and Geo. H. Plimpton of New York City, and Solomon Lewis of Melrose.

A CHARTER was granted at Harrisburg, Pa., on August 2, to the Scranton Chimney Cap Company of Scranton, Pa. Capital, \$30,000.

THE STUART & PETERSON COMPANY, Burlington, N. J., announce that they are now engaged in manufacturing Porcelain lined bathtuba, and solicit correspondence from contractors, builders and architects.

W. B. Hubbard, manager of the Boston house of Peek Brothers & Co., has been busily engaged in preparing the sample room for the advantageous display of lavatories, enameled baths and water closets. The features of the showroom, however, are the nickel plated lavatory, bath and other fixtures, effectively displayed on a black velvet background.

HOWARD & MORSE, 45 Fulton street, New York, manufacturers of Wire Goods, sustained some injury to their factory in Brooklyn in consequence of a fire on adjoining property on the night of July 24. Their stable was destroyed and an extention to building No. 10 of their plant was damaged. Loss, \$4000 to \$5000. The fire, we are advised, will not in any way interfere with the execution of any orders in hand.

CORDLEY & HAYES, 172 Duane street, New York, have brought out a new line of Indurated Fiber Ware, which, line of Indurated Fiber Ware, which, we are told, owing to new processes, they are enabled to produce more economically. The assortment includes Wash Basins. Spittoon Tops, Pail Covers, Slop Jar, Mats, &c. The advantages obtained in the improved patterns are a more shapely appearance, the Wash Basins approaching those enameled on metal, with regard to thickness of material. The goods have a cherry porcelain finish and are said to retain the good qualities of their "Fibrotta" or Lily Brand Fiber Ware.

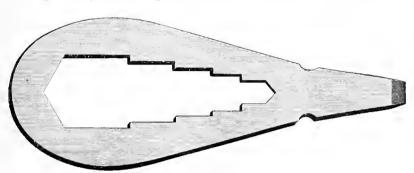

<sup>\*</sup> Same as Hughes & Patterson in former reports.

# THE RETAIL STORE.

## Combined Wrench and Screw Driver.

The accompanying illustration shows a combined wrench and screw driver, just brought out by the Coe Mfg. Com-

ters the back of the iron, and to this is attached a rubber tubing, the other end being placed on the gas burner. A wire bracket and spiral spring are provided to hold the upper portion of the rubber tube in a convenient position. The

Combined Wrench and Screw Driver.

pany, 98 Duane atreet, New York. The general features of the tool, which is intended particularly for bicycle use, are shown so clearly in the illustration that no extensive description is necessary. The wrench is adapted to five sizes of nuts, from  $\frac{1}{4}$  to  $\frac{5}{4}$  inch, the intermediate sizes being  $\frac{1}{2}$ ,  $\frac{9}{16}$  and  $\frac{11}{16}$  inch, and may be used with either square or hexagon nuts. The tool is made from  $\frac{1}{8}$  inch steel, handsomely nickel plated, and the end is finished as a screw driver. The cut is the full size of the device.

## Gasoline Stove Ware Adjuster.

The device shown in the accompanying illustration is the gasoline stove ware adjuster put on the market by the Wagner Mfg. Company, Sidney, Ohio. The device is a conical ring with a handle attached and its employment permits the use of round bottom cooking utensils and wafile irons on gasoline

Gasoline Stove Ware Adjuster.

stoves. Because of the conical form one side is adapted to fit No. 8 ware and the reverse side No. 9 ware. In addition to adjusting the ware to the stove it is pointed out that it equalizes and retains the heat under the cooking utensil.

#### Bolgiano's New Hot Air Perfection Gas Irons,

The accompanying cuts represent hot air gas irons offered by the Bolgiano Mfg. Company, 415 Water street, Baltimore, Md. The iron for household or laundry use shown in Fig. 1 is nickel plated and weighs about 7½ pounds. A bronze tube and mixer en-

iron consumes but a small quantity of gas, the cost being 5 cents per day for gas, as stated by the manufacturers. The points of excellence claimed for

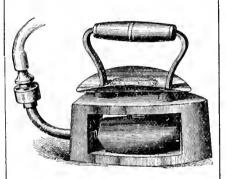

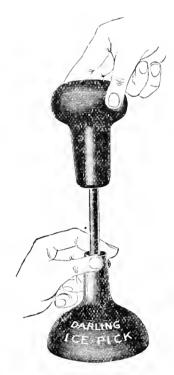

Fig. 1 -Household or Laundry Iron.

the iron by the makers are as follows: It is always hot, saves coal and does away with the overheated stove; it allows the room to be kept at a pleasant temperature, both in summer and winter; it saves steps from the ironing board to the stove, and can be operated sitting as well as atanding. The tailors'

The Darling Ice Pick.

Darling Filter Company, 26; South Water street, Cleveland, Ohio, are putting on the market the ice pick here shown. The cast head slides upon the pointed rod when in use and forces it into the ice. The cast bell is held

The Darling Ice Pick.

against the ice to prevent the particles from flying while the ice is being broken. The head or knob may also be used for breaking ice in the hand. The tool is finished in japan, and claimed by the makers to possess desirable features peculiar only to itself.

At a meeting of the Eastern and Western anthracite coal agents in New York City last week it was decided to

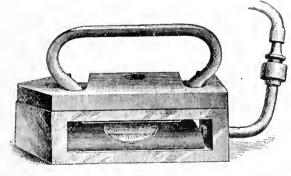

Fig. 2.-Tailor Iron.

iron, illustrated in Fig. 2, is operated in the same manner as the smaller iron. The makers state that it gets hot in five minutes; that there is no smell or dirt in using it, and that it is economical, costing but a few cents a day for gas.

limit the output for August to 2,500,000 tons and to maintain the present prices.

The strike of the iron miners on the Gogebic range was declared off on Saturday, after an idleness of six weeks.

# HEATING DO PLUMBING.

NEW WORK AND CONTRACTS.

N A. Kernan, Utica, N. Y., is remodeling the heating plant in his new home, the residence of the late Roscoe Conkling, and is using two No. 24 Royal hot water heaters, with both direct and indirect radiators.

A NEW SYSTEM OF WATER CLOSETS is being considered for three schools at Chattanooga, Tenn.

A MILLS BOILER, made by the H. B. Smith Company of Westfield, is being placed in the basement of the bank block at Palmer, Mass., by the Phillips Mfg. Company of Springfield.

THE COLLEGE AUTHORITIES of Middlebury, Vt., have made a contract for steam heating apparatus with Calhoun & Stewart to heat the library, reading room and gymnasium in Painter Hall and all the rooms in the chapel building.

A. V. FETTER has received the contract for doing the plumbing in the new Merchants' State Bank, at Rhinelander, Wis., and also for putting the heating and ventilating apparatus in the new school house at Whitewater.

THE FIRE DEPARTMENT COMMITTEE of Minneapolis. Minn., at its meeting last week, ordered that the furnaces in three of the engine houses should be taken out and replaced by steam heating plants. These stations are No. 4, Tweifth avenue, North, near Third street; No. 8, Blaisdell avenue and Twenty-eighth atreet; No. 10, Oak Lake addition.

THE BOARD OF STATE PRISON COM-MISSIONERS of Montana awarded the contract for putting in a hot blast heating and ventilating plant at the Eastern Penitentiary, at Billings, to the Adams-Rider Company of Helena, at their bid of \$5700.

AT THE MEETING of the Executive Committee of the Board of Trustees of the Winthrop Normal College, held at Rock Hill, B. C., last week, the contract for doing the plumbing of the new buildings was awarded to W. D. Dowd of Charlotte, N. C., for \$2800.

STEAM HEATING APPARATUS is to be put into Bearce Hall, Kent's Hill, Maine, and next year the school buildings will all be heated by steam.

FOSKETT & BISHOP of New Haven have the contract for putting the steam heating apparatus in the new houses of Geo. F. Hunt and John E. Hunt, Derby, Conn.

D. H. Kelly, Derby, Conn., is putting two Mahony steam heaters in R. W. Blake's tenement house on Caroline atreet.

THE BARLOW BROS. COMPANY, Waterbury, Conn., have the contract to put a steam heating plant in Mr. Rugg's house at Seymour.

Chas. Wheeler has the contract for the plumbing and hot water heater for L. F. Sherwood's new house at Southport, Conn.

GEO. RAPELYE, Bridgeport, Conn., has the contract for a Fuller & Warren combination hot air and hot water heater to be placed in C. B. Stanley's house on Lexington street.

M. J. Kibbe, Bridgeport, Conn., has the heating and plumbing contracts for D. E. Bradley's new house, at Berlin;

also for Dr. Gillen's house, in the same place. He has the plumbing work for two houses for Centractor Chas. Johnson ou Andrew street and one on Prospect street for Contractor Ralph Kent.

F. Horsfall has the plumbing contract for A. J. Sloper's new house at Bridgeport, Conn.

THE CONTRACT for placing the ateam heating plant in the new addition to the Bridgeport, Conn., Hospital has been awarded to the Bridgeport Steam Heating Company.

W. II. MEEKER & Co., plumbers, Norwalk, Conn., are placing a new steam heating apparatus in the City Hotel.

ARCHITECT HENRY A. LAMBERT, Bridgeport, Conn., is about to erect a residence for himself, to have a system of plumbing and to be heated by a furnace.

LANGDON & DALY, Main street, Hartford, Copn., have the plumbing and gas fitting of a house on Sergeant street for Clark & Loscher, the contractors, and one on Oxford street for the same parties; one on the corner of Broad and Rusa streets for John Cosgrove, and one in South Windsor for E B. Farnham.

T. H. LANODON, Hartford, Conn., has taken the contract to put in a Delamater Ericason hot air pumping engine at the new residence of Geo. P. McLean in Simabury. Mr. Langdon is making a specialty of these pumping engines. Mr. Langdon alao has the plumbing contract and the hot water heating with a Whitlock coil hoiler.

SIX THATCHER HOT AIR FURNACES will be used in the apartment houses which H. Harbison is erecting at Hartford, Conn. Each house will have a bath room and laundry tuba.

JAMES AHERN, Hartford, Conn., has the contract for the plumbing in Amos Whitney's new residence on Farmington avenue. There will be three bathrooms and six lavatories, all with the fineat fixtures. Mr. Ahern will also put about 20 closets in the new West Middle School.

THE BOARD OF CONTROL has awarded the contract for heating one-half the Lochiel School Building, at Harrisburg, Pa., to B. G. Carpen er & Co. of Wilkes Barre, who agree to put in a heating apparatus for \$2250 which will do the work.

THE PLUMBING CONTRACT for the new High School Building, at Brookline, Mass., has been awarded to James Tucker & Son of Boston.

J. II. Mack, Fitchburg, Mass., has been awarded the contract for the heating and plumbing of Walter Perley Hall's new house.

EXTENSIVE IMPROVEMENTS will be made to the Ohio State Reformatory Building at Mansfield, Ohio. Steam heating and other work will be done.

Contracts have been closed by customers of Hart & Crouse, Utica, N. Y., for Royal Boilers, to he used in heating the almshouse, at Middleburg, N. Y., the Church of the United Brethren, at Fort Wayne, Ind, the St. George's P. E. Church, at Flushing, N. Y., and two of their large steam boilers will be used at the Tressler Orphan Home, at Loyesville, Pa.

THE COUNTY COMMISSIONERS of Mankato, Kan., awarded the contract for putting in the heating plant at the new jail to A. O. Nepil of St. Paul, at his

bid of \$1205. He is to supply a radiation of 1400 lineal feet and guarantees the plant for two years.

THE SELECTMEN OF South Adams, Mass., have awarded the contract for placing steam heating apparatus in the Station House to H. S. Simmons of North Bennington, Vt., at \$590.

JAMES TRIBBEV has been awarded the contract to build a \$16,500 school house at Gas City, Ind. This does not include the heating.

A NEW SCHOOL BUILDING to cost \$12,000 is to be built at Leavenworth, Kan., which will have a heating and ventilating plant. The Morris School will have two new boilers put in at once, which will double the heating capacity. The Maplewood Building is also to have a furnace and other modern conveniences added at once.

SECRETARY OF STATE WM. F. HARRITY, Harrisburg, Pa., will receive bids till August 17 for the plumbing and repairs to the Senate, Assembly and several State departments for the year ending June, 1895.

O. H. GLOYD has contracted to do the plumbing work in the Grammar School Building at Thomaston, Maine.

THE CONTRACT for heating and plumbing Sanborn Hall, at Hanover, was awarded to Lee Bros., Concord, N. H.

THE SCHOOL BOARD, Doylestown, Pa, have awarded the steam heating contract for improvements in the heating plant in one of their school buildings to Rufe Bros. for \$1950. The improvements will include a complete set of new boilers and radiators.

At the special school meeting of the Eighth District, Manchester, Conn., if was voted to furnish an independent heating apparatus for the new part lately added to the school buildings, and a committee was appointed for the purpose.

A HEATING PLANT for the school at Lincoln, R. I., is being considered.

THE SANITARY HEATING & VENTILATING COMPANY of Peoria, Ill., have been awarded the contract for the heating and ventilating apparatus for the Fort Dodge, Iowa, Post Office for \$4270.

THE KIDDER MACHINE COMPANY, Franklin, N. H, have accured the job to remodel the heating and sprinkler system at the Dodge, Davis & Company mill, Bristol.

THE UNDERHILL HEATING & VENTILATING COMPANY bid \$3500 and were awarded the contract for heating the school at Williamstown, Mass.

Bids for heating and ventilating School No. 19, on Rebecca avenue, Scranton, Pa., will be received by the school hoard.

SEALED BIDS for constructing a steam heating plant in the Lake Park School Building, Dea Moines, Iowa, will be received by Nelson Royal until August 21.

Picard & Son have obtained the contract, amounting to about \$6000, for placing a heating apparatus in Levis College, Quebec.

THE CONTRACT for plumbing, heating and ventilating the new school of St. Joseph's parish has been given to the Pawtucket Steam & Gas Pipe Company, Pawtucket, R. I.

R. D. Nixon has been awarded the contract for plumbing in the new barracks building of the Western Military Academy, Alton, Ill.

# STOVE TRADE NOTES.

### The Chicago Stove Trade.

Stove houses are having their usual experience at this time of the year with countermands. It had been supposed that merchants were buying so conservatively that they would be certain to take in such stoves as they had ordered for fall delivery. With money easy, with no special strain on general financial resources and no panic in sight or even fcared, the situation seemed so much better than last year that the stove trade was expected to go along without a hitch, although no one anticipated a volume of business anywhere near the average, on account of the depression in manufacturing lines, together with the low price of farm produce. But along came the railroad strike, interfering with shipments of perishable products and checking the operations of innumerable local industries, disheartening merchants in many places and making them faint hearted just as they had begun to pluck up a little more courage. On top of that, as if nature had joined forces with man to ruin the country, a period of drought culminated last week in a scorching wind, which swept through the Missouri Valley region and shriveled vegetation over a wide expanse of country. The destruction wrought is believed to have been overestimated, as rains have since fallen in that part of the country, and crops are often found to have a remarkable recuperative power. But the late crops will unquestionably be smaller than farmers will wish to see and merchants are anticipating their inability to buy liberally of stoves and other house furnishing goods.

Manufacturers are taking the situation philosophically. They have passed through so much of a discouraging character the past year and a half that they have been taught patience and quiet submission. If there is a chance that stoves taken would not be paid for, they say it is better for them to keep the stoves in their own warehouses or, in fact, not order them made up, and save the investment in material and labor. Another consideration also induces the philosophic temperament. The writer was in a stove house a few days since when the manager read a very appalling letter from a customer, who begged to be released from his agreement to take certain stoves which were to be shipped September 1, stating that crop prospects in his neighborhood were very doubtful, and it was a serious question whether any of his patrons would be able to buy a stove

this fall. It sounded like a countermand of a carload order, at least. The manager turned to his books to see the size of the order which this customer had placed with the firm's salesman and found that it called for just two stoves! As most orders placed this year are not much larger, it will be seen that countermands are not so serious as they used to be.

It is fortunate that all parts of the West are not afflicted with the short crop scare. This is a big country and the West forms a big part of it, and an important section of the West is in excellent condition. There are localities in which trade is fair at this time and promises to be better as the sesson advances. Even the drought-stricken districts may turn out much better in the "round up" than is now expected.

#### S. B. Sexton & Son,

Baltimore, Md., have brought out a new catalogue for this season, which they are distributing to the trade. This which was established in concern, 1839, make a very extensive variety of Baltimore fire place heaters, stoves, ranges and furnaces. In the catalogue before us attention is directed to these goods, with numerous illustrations showing the appearance of the heaters. opening pages are given up to the Baltimore heaters, the Sexton's Grand, the Sexton's Improved Model, the Sexton's Eclipse, Sexton's Daisy. Sexton's Inaugural, Sexton's Improved Original, Sexton's New Charm, and Sexton's New Victor heater. These heaters are shown set in position and their special features are referred to in the accompanying text. The next goods noticed are Sexton's gas burner and Sexton's first fire place heater of the 1848 pattern. The design and construction of this old stove presents a curious contrast with the present Grand heater, which is the latest development. Two pages of sectional illustrations show the method of setting the Sexton heaters. A number of pages are given up to repairs, after which Sexton's brick and portable ranges are noted. styles of brick set ranges are shown with particulars of sizes and prices. The Baltimore ranges are next illustrated with horizontal boiler, eight different atyles being shown. This form of boiler has been brought out to meet the demands of the trade for this sort of arrangement. A line of ranges with the usual vertical boiler is next shown. The section of the catalogue following, pages 58 to 75, is devoted to portable ranges. At the close of this section heating stoves are noticed, and the remainder of the volume, with the exception of a few tables of registera, capacity of pipes, &c., is given up to the hot air furnaces, their line at pres-ent consisting of 22 furnaces, eight sizes and five different styles of construction.

## The Rock Island Stove Company

of Rock Island, Ill., have issued a fine catalogue for the season of 1894 95, descriptive of their Riverside stoves. comprises 128 pages and is bound in fawn colored heavy paper covers, with embossed gilt title. The contents open embossed gilt title. The contents open with illustrations and descriptions of the New Home Riverside range, a new line for soft coal and wood, brought out for this season. It is a five-hole range, and is shown in a variety of styles. Next follows the Riverside six hole range for soft coal and wood, also shown in a number of styles. Riverside range is also made with duplex grate for hard coal or wood. The Home Riverside is a four hole range in two sizes; the Ideal Riverside is also a four hole range in two sizes, both being furnished in any style. The Rock Riverside is a new medium priced tione of four-hole ranges. The cook stoves illustrated are the Home Riverside, in two series, the Ideal Riverside, the Rock Riverside and the Wood Riverside. The heating the Wood Riverside. The heating stoves made by the company include the Maple Riverside, a new wood base heater in two sizes. heater, in two sizes, nicely ornamented and finished with a large top for cooking, having a swing cover; the Riverside Oak, reconstructed and greatly improved for the season of 1894, and the Island City cannon stove. catalogue is replete with features of interest to the buyer. Not only are code words systematically arranged for economical telegraphing, but characters and abbreviations are given to save time and space in making up orders. Sec-tional cuts are also used to show the various parts of stoves and to thoroughly explain their internal arrangement. A very instructive sectional cut shows how to clean a stove or range. Some 10 pages are devoted to a very thorough list of repairs.

#### ODD PLATES.

F. M. Borden & Bro., 118-122 North Second street, Philadelphia, send out a buff card, printed in brown ink, stating, "The season for stove repairs is here," and asking, "Are you prepared for the rush?" The card then cnumerates the varied line of stove fittings, furnishings and supplies which they are prepared to ship promptly. They have the sales agency for the Abram Cox Stove Company and the Leaf Stove Company.

THE ART STOVE COMPANY, Detroit, report that their display at the Antwerp Exposition was received with marked attention, and their agent on the Continent advises them that the Europeans take kindly to American goods. They were particularly successful with their line of oil heaters.

THE DIPPO MFG. COMPANY, Cleveland, Ohio, whose Ferrosteel ranges have met with such success, publish a neat little pamphlet entitled "Blue Book for the Stove Trade." This is sent out under date of August, 1894,

and is addressed to dealers and others interested in the Ferrosteel goods. It contains a short treatise on the general advantages of steel, followed by special reference to Ferro steel and the application they have made of it. Then follows a general account of their works at Chagrin Falls and the advantages they possess in their location, special reference being made to their water supply, which is one reason, they say, why their nickel plated castings are so highly finished. At the close two or three pages are given up to the Ferrosteel ranges and the special features of the different styles. The trade will be interested in securing a copy of this pamphlet, which is sent on application.

The Girard Stove Works, Girard, Ohio, have decided to purchase the plant of the Youngstown Foundry Company, Youngstown, Ohio. They will put up new buildings for enlsrging their business and will remove their stove plant to Youngstown. They will also increase their capital stock to \$40,000.

THE PORTLAND STOVE FOUNDRY COMPANY, Portland, Maine, have brought out a neat circular relating to the Atlantic furnace of their manufacture. A broken view is shown of the apparatus, printed in red ink, making a neat contrast with the text, which appears in blue. A full account of this furnace is given in the circular, together with views of residences heated by it. The last page of the circular illustrates and describes the Atlantic combination heater, which is referred to as a valuable supplement to their line of Atlantic furnaces.

"THE FOX SMOKE CONSUMING FUR-NACES FOR SOFT COAL" is the title of a brown bound pamphlet sent by the Fox Furnace Company, 28 Vincent street, Cleveland, Ohio, who manufacture the Fox furnacea. The soft coal furnace, Fox furnacea. The soft coal furnace, it is pointed out, is an apparatus for which there is a growing demand, and this concern have given particular attention to making a suitable heater for In an introductory using this fuel. paragraph the durability of this furnace is dwelt upon and the smoke consuming feature is then described with suitable The Fox furnace is then illustrations. taken up and all its different featuresgrate, dust flue and fire pot—noted; both the cast and wrought iron radiators are given attention, and the joint used in connecting the atecl plate to the casting is illustrated by a sectional view. The last furnace shown is the Fox furnace, with steel plate radiator, for wood or soft coal. All particulars of the apparatus are given, together with tables of sizes.

The supplement to catalogue and price-list No. 97, issued by Buck's Stove & Rauge Company of St. Louis, Mo., is a neat pamphlet of 30 odd pagea, describing a line of interesting goods. Since issuing their last catalogue and price-list the company have designed and manufactured a number of first-class stoves and ranges, which they commend to the favorable notice of the trade. They say this supplement will give the trade an idea of the nature of their extensive additions, and they issue it as advance sheets of their regular annual catalogue, which will include the full line of their manufactures, and which will be ready January 1, 1895. A large part of the present supplement is given up to Buck's steel ranges, opening with a general description of the apparatus and all the special features being pointed out. A skeleton cut of a Buck's steel range very clearly

shows the constructive features and the design of the cooking apparatus. Separate cuts of the different parts are also given. Thirteen styles of Buck's steel ranges are shown, which is a variety of modification sufficient to meet all the wishes of the housewife. At the end of the pamphlet attention is directed to Buck's parlor stove and Buck's oak in four styles. Buck's Superb cottage is a handsome wood stove shown at the end. A separate leaflet issued at the same time relates to Buck's Royal heater, a stove of handsome design and elegant finish.

The Detroit Galvanizing & Sheet Metal Works, Detroit, send out attractive circulars relating to the improved air tight heating stove Surprise, which they manufacture and sell. The stove is made of planished or amoeth iron with sheet steel lining, and, it is pointed out, will burn cordwood, corn cobs, &c., in fact anything burnable that can be put into a 13 inch round hole. A half tone engraving of this heater is shown in the circular, and particulars of construction and merita are pointed out.

THE PITTSTON STOVE COMPANY'S WORKS, Pittston, Pa., resumed work on Monday full handed. About 150 men and boys are given employment.

Mantels, register frames and register borders, slate for use under school house heaters and hot air furnaces, in any size and shape, can be supplied by the Monson, Maine, Metal Slate Co., Boston. They also carry in stock a full line of slate hearths and chimney tops, and are in a position to promptly fill orders for slate to dimension for special requirements.

THE WALKER & PRATT MFG. COMPANY, Boston, Mass., iasue a small 12-page pamphlet entitled "About Flues" and bearing the inscription "The auggestions are designed to make clear to those who use furnaces and ranges the conditions necessary for their satisfactory operation." The perusal of this book will prove of advantage to these who are about to engage in the fall business of setting up stoves, ranges and furnaces.

D. H. Erdman, Camden, N. J., manufacturer of the Giant heaters is at Island Heights, N. J., for the summer.

WE ARE INDEBTED to the Portland Stove Foundry Company, Portland, Maine, for a photograph of their new Atlantic Grand range, a very hand-some piece of kitchen furniture. The range is provided with a base, has end ash pit, reservoir and an elevated warming shelf, to which is attached a back guard furnished with plate warmers, while a high shelf adds to the attractiveness and completeness of the design. A nickel panel embellishes the oven door, and a shelf is attached below. The door in addition to having a nickel knob is provided with a kicker for opening. A towel rack, provided with an Alaska knob, hangs from the fire box end. The range is provided with a large feed door, a draft slide of generous proportions in the ash pit door, providing for an ample supply of air. A modern labor saving grate and large fire box door are also provided.

THE MUSICAL WORLD will be charmed with a circular lately issued by the Troy Nickel Works, Troy, N. Y. It is a folder carrying on the outside illustrations of some of the well-known Alaska gooda and on the inside a beautiful song with music entitled "Lift Thine Eyes." The instructions are that it

must be played with 18 banjoes and one medium sized Gatling gun.

A RECENT ISSUE of a local paper published at Rondout, N. Y., contains an advertisement in verse of the Canfield Stove Company of that place. The argument of the poem is that the New Process vapor atove, sold by the Canfield Stove Company, is the most excellent thing of its kind.

S. A. Lord of the Great Western Stove Company, Leavenworth, Kan., was presented with a handsome silver service, July 27, it being the twenty-fifth anniversary of his connection with the firm.

### New Leader Stoves.

The Collina & Burgie Company, 225 West Twelfth atreet, Chicago, have brought out some new stoves this season, in which are embodied some notable features. Conspicuous among their heaters is the Grand Leader base burner, which is made in three sizes. This stove is of exclusively new design and is unusually well proportioned. It belongs to a type of stoves which has proved very popular the past year or more, yet ia distinctive in its decorative appointmenta and in the principles of its construction. The dome top is gracefully curved, straight lines being avoided as much as possible, while each of the four corners is finished with a bold swell somewhat in the form of a leg of mutton, or the style of sleeves now so fashionable in ladies' dreases. The similitude to a lady'a dresa is further continued in the shape of the front of the nickeled cap, which curves down to a point over the stove doors like a bodice. Double mica doors open up the full hight on each side of this point. The base is made exactly equilateral, so that any one of the four sides of the nickeled skirting will fit any of the other sides. The fire pot can be taken out through the front doors of the stove, but Manager Moffatt thinks that the fire pot of this stove will not need to be taken out, as it is cast as thick at the top as at the bottom, so that it is almost proof against cracking.

The Royal Leader is a new six hole range of handsome design. The front is curved, the oven door is deeply swelled, the edges are nickel trimmed and the guard in the rear of the top is of an attractive pattern. The oven is fitted with a revolving bottom. ia a circular open work casting, pivoted in the center, on which articles can be set in front and then easily shifted to-any part of the oven. An interesting point is the arrangement of the pipe ahelf. This is made to fit exactly on the top of the guard rail. The guards on all the company's ranges are of the same size, so that one of their plpe shelves will fit any of their ranges. The high warming closet is built in the same way to fit any pipe shelf, while the pipe shelf will form the bottom of the warming closet. This avoids the carrying of a large assortment of pipe shelves and warming closets in atock.

The Head Leader and Home Leader are also new aix-hole ranges. The Head Leader has a flat grate and the Home Leader a duplex grate with detachable shank, permitting the grate to be removed and a new one inserted without disturbing the lining. The detachable grate is now made by the Collins & Burgie Company with a triangular socket and shank, so that the operator cannot fail to restore the grate to its proper position after shaking. These ranges are made in two sizes and furnished in all styles.

# TRADE REPORT.

### The Iron Market.

In the majority of the great markets and in the trading lines there is a dia-It is not tinct increase in the demand. enough to be particularly jubilant over, nor is it general or uniform Consumers have been atarving themselves so long that they are forced into placing orders for supplies. The railroads are giving out some work for renewals and repairs. They are doing a little in cars and in bridges. Possibly this may appear more encouraging than it ought to be, because it compares with previous months of complete apathy. The situation in the Connellsville Coke region has taken an unfavorable turn, so that the starting of a number of furnaces during the past few days may prove to have been premature. The Wire trade, the largest consumer of Soft Steel, is beginning to show signs of revival, the inquiries for Rods having become larger and more urgent. It must not be forgotten that conditions are abnormal both as to supply and as to demand, and that both are pretty evenly balanced. Prices could not help feeling a change in the situation created by even a very modest increase in consumption. The general business does not seem to encourage hope in that direction, but still it is possible that a settlement of the tariff question may start the ball rolling.

Pig Iron. - Business in the New York market continues exceedingly dull. In that part of the State north of Albany and Troy the Buffalo producers are making low prices. The stove trade is spoken of as very dull, while the makers of water works supplies are busy and the machine shops are doing a fair amount of work. We quote standard brands \$12.50 @ \$13 for No. 1; \$11 @ \$12 for No. 2, at tlderor No. 1; \$11 @ \$12 for No. 2, at tidewater. Southern Iron, same delivery, \$11.50 @ \$12.25 for No. 1; \$10.50 @ \$11 for No. 2; \$10 @ \$10.25 for No. 3; \$10.25 @ \$10.75 for No. 2 Soft, and \$10.50 @ \$11 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9.75 @ \$10.25 \$10.25.

Philadelphia advices note that there is not an unusually heavy demand for Pig Iron in that market, but from general indications it seems probable that the demand exceeds the supply. This has not been to an extent to affect prices, but in the long run it must do so, unless there is some change in the proportions. Low priced Irons are very closely taken up, and while there is no real scarcity of other grades, the supply is small enough to enable holders to be very firm in regard to prices. General quotations for Philadelphia and near-by points are about as follows:

J 1		
Standard No. 1 Foundry X.	 \$12.50 @	\$13.00
Standard No. 2 Foundry X.	 11.50 @	12.00
No. 2 Plain	 10.75 @	11.00
No. 1 Soft	 11.50 @s	11.75
No. 2 Soft	 10.75 @	11.00

A more cheerful tone is reported as perceptible among the sellers of local Coke Iron in Chicago. They have enjoyed a much larger trade than for either of two previous weeks and inquiries are coming in quite freely from expectant buyers. Among the orders placed were

several for 1000 ton lots and one or two for about 1500 tons. Prices, however, have not advanced with the improved movement, but some modifi-cations have been made in quotations. A somewhat better business was transacted in Southern Coke Iron, but only in soft grades, the largest reported sale being one for 300 tons. Lake Superior Charcoal is in slightly better demand, but prices are a little easier. Quotations are given as follows for cash: \$14.25 @ \$15.00

Lake Superior Charcoal	\$14.25 @	
Local Coke Foundry, No. 1	10.25 @	10.50
Local Coke Foundry, No. 2	10,00 @	10,25
Local Coke Foundry, No. 3	9,50 @	10,00

Alabama Car Wheel	17.50 @	18.00
Jackson County Silvery	15.25 @	16.00

In the Pittsburgh district Foundry Iron continues dull in demand at un-changed prices. The following quotations sre given for forward delivery: 

While the volume of business in the Cincinnati district has been small during the week, there has been some gain in confidence, for the volume of business during the month of July was quite as large as in June and somewhat better prices have been obtained. The Southern furnaces have not much Iron to sell and those which have some Iron on hand are holding it out of market because they are convinced they will be able to get better prices later in the season. There are ample offerings of No. 1 Foundry, but there is not much demand for this not much Iron to sell and those which there is not much demand for grade, while No. 1 and No. 2 Soft are scarce and in good demand. No. 2 Foundry is selling fairly well on the basis of \$7.25, f.o.b. Birmingham. The Iron Pipe works are melting considerable Iron, but are obtaining it on old contracts. All parties are looking for a revival of general trade and are impatient at the delay in passing the tariff bill in some shape. Prices of Iron are without quotable change. Quotations are as follows:

-	
Southern Coke. No. 1 \$10.25 @ \$	10.50
Southern Coke, No. 2 9.50 @	9.75
Southern Coke, No. 3 9.25 @	9.50
Ohio Soft Stone Coal, No. 1 14.50 @	15.50
Ohio Soft Stone Coal, No. 2 14.00 @	14.50
Lake Superior Coke, No. 1 12.50 @	13.00
Lake Superior Coke, No. 2 11.50 @	12.00
Hanging Rock Charcoal, No. 1., 16.00 @	17.00
Hanging Rock Charcoal, No. 2., 15.50 @	16.00
Tennessee Charcoal, No. 1 13.00 @	13.50
Tennessee Charcoai, No. 2 12.00 @	12.50
Standard Southern Car Wheel 16.25 @	17.00
Lake Superior Car Wheel and	
Malleable 16.25 @	16 75

The Pig Iron situation in St. Louis does not show any material change. The scarcity of No. 1 Soft and No. 2 Foundry Irons still continues and prices of these two grades are firmer in consequence. Consumers are beginning to take some interest and there are more inquiries in the market. The output is not heavy and there are no large stocks of Iron on the furnace banks. The general situation is ateadily improving and some effect is likely to be felt in

prices before many days. Quotations are given as follows for cash, f.o.b. cars St. Louis :

dry 9.75 @ 10.00 Southern Car Wheel 16.50 @ 17.00

Birminghsm (Ala.) reports indicate extreme duliness in the Pig Iron market, which is in a very peculiar condition. On the one hand the furnaces claim to be asking from \$8 for No.1 Soft and No. 2 Foundry on new orders, while on the other hand it is reported that less than \$7 was paid for a round lot, some 2500 tons, of these grades. Small orders are plentiful, but furnaces claim to be firm in refusing to sell ahead or make immediste delivery below quotations given. No. 1 Foundry is quoted at \$8.50 @ \$9; No. 1 Soft and No. 2 Foundry, \$7.50 @ \$8; No. 3 Foundry, \$6.75 @ \$7.

### Metal Market.

Pig Tin.-The market has been dull and heavy throughout the week. The arrivals hardly average consumptive demand and almost entire absence of speculative interest, along with reported heavy shipments from the Straits the past month, combined to more or less seriously affect the market. Jobbing parcels are being sold at prices very close to those quoted for round lots, but consumers generally are buying cautiously and do not appear to be tempted by the previously low prices. The importations last month were about 1500 ions, or considerably in excess of the estimated consumption. Straits shipments were heavy also, including 3300 tons to Great Britain and America and 600 tons to the Continent, against a total of 2425 tons for the corresponding period last year. The amount of Tin in sight would thus appear to have increased several hundred tons, leaving the statistical position worse than it was a month ago. The visible supply for Europe and America is now estimated at nearly 21,000 tons. A year sgo it was about 15,000 tons.

Copper.-There has been no distinctively new movement. Most of the Lake Superior producers are well sold ahead and busily engaged making deliveries on old contracts. The Montana and Arizona companies doubtless lost custom by what may be termed the "drive" recently made by prominent Lake Superior concerns, but they make a showing of indifference and work in a secretive way that is not only suggestive but which encourages the idea that matters are not as smooth as represented. The demand from smaller consumers has been unimportant, and prices for small lots of Lake Ingot remain unchanged at about 101¢ \$ 1b.

Sheet Copper.-The demand for Manufactured Copper is still dull. An absence of large inquiries is noted, while buying is limited to immediate needs. For small lots from stock, jobbera' price is 15¢ \$\mathbb{B}\$ lb, net basis.

Pig Lead. — While the extreme prices reached last week for spot stock have not been duplicated, except in remote instances, the market still shows very firm tone, and it is doubtful if car lots can be purchased below 3 65¢ at this writing. Small lots of American Pig are quoted at from 35¢ @ 4½c @ lb, the higher being the figure at which sales are most frequently made. Supplies in this district are limited, but they are sufficient for the present moderate demand.

Lead Pipe and Sheet.—The month of July was marked as one of exceptional duliness among dealers in manufactured Lead for plumbers' uses. The absence of speculative building in this section has restricted the demand very considerably, and this has been felt seriously by the trusts which eater to the builders. The more conservative concerns have not felt the falling off quite so keenly, yet a large and representative firm of this character experienced a decline of 20 % in sales during July compared with those of the same month of last year, when the business depression was severe. Stocks in both manufacturers' and consumers' hands are low. The outlook is not generally reported as oright, although a fair buying movement to fil present requirements would probably follow a settlement of the tariff question.

Spelter—On the surface the market has a weaker appearance, and the offering of stock for early shipment from primary points is freer than it has been for some time past, which would indicate that more or less accumulation of stock at smelting works has taken place recently. Small lots of Western still rule at about 44¢ 7 lb.

Sheet Zinc.—The demand for this material shows no appreciable expansion, and prices have been lowered, jobbers' rates for 600 lb casks being quoted at  $5\phi \otimes 5\phi$ , and that for small quantities at  $5\phi \otimes 5\phi$  lb.

Antimony.—The jobbing trade is moderate and prices are about holding their own. Spot figures for small parcels of Hallett's are 10¢ and Cookson's 10¾¢ \$\partial 1b\$.

Tin Plate.—No improvement has taken place in the volume of business or in the character of orders. It has been almost a hand to mouth business, since consumers outside of the large ones engaged in export business, who receive a drawback, are extremely careful pending the outcome of tariff legislation. Early in the week a few large orders were placed mainly for special sizes of Cokes for future shipment, but this class of business as a rule has been very dull. Stocks here are very moderate, but there is plenty of material on the other side awaiting shipment at short notice. American Roofing Plates of the finer grades command a good sale at remunerative prices. Otherwise prices, although showing no radical change, are inclined to softness.

A special London cable dispatch of August 1 to The Iron Age thus describes the British Tin Plate market: In the Tin Plate market there has been very little change. Buyers are supplying only immediate wants, and while some makers quote slight concessions in order to keep mills going there is no radical change in prices. More inquiry is noted for oil sizes and a few lines were placed at below recent quotations. There is a doubtful feeling as to the future. Prices f.o.b. at Swansea are as follows:

Sheet Iron.—A slight increase is noted in inquiries for Black and Galvanized Sheeta, but the consumptive demand is still moderate so far as jobbers are concerned. Mills are reported as being busy on orders, how ever. Those making Black Plates for tinning, especially have all the orders they can fill. Prices show as yet no improved tendency, but remain on the low level established some months ago. Galvanized Sheets in small lots are quoted at 75 % @ 75 and 5 % discount.

## Chicago Report.

Scrap.—Trade continues very light. Dealers quote the following list of buylng prices, Chicago delivery:

The June report of the Philadelphia & Reading Coal and Iron Company makes a better showing than has been the case for some time. The gross receipts are given as \$2,348 983, and profit from mining \$211,741, against operating expenses, improvements, &c., amounting to \$2,137,243 Deducting fixed charges, there is a surplus for the month of \$39,532, against a deficit of \$93,132 in June, 1893. The seven months of the current fiscal year show, however, a deficit of \$552,343, against a deficit in the corresponding period of last year of \$706,189.

#### CONDITION OF THE

# Hardware Trade.

THE IMPROVED CROP REPORTS have had a good effect on the feeling of all business classes, but the uncertainty regarding tariff changes prevents any general willingness to order more than for immediate requirements. This policy has been carried by many to a point where its disadvantages more than offset its advantages. Reports from the different sections of the country indicate considerable activity, but the lines are generally small.

Advices from Chicago.—The crop scare is about over for this time and jobbers are now feeling considerably better than they did a few days since, when, according to numerous press dispatches, the vegetation was completely destroyed by hot winds in a very large part of the best agricultural section of the West. Timely rains have fallen, and the outlook for crops has improved very decidedly within three days. The demand for Shelf Hardware shows considerable improvement over previous weeks. House Furnishing Goods are also moving more freely. The country merchants are still purchasing carefully, and sorting up rather than taking in stocks, but orders of this character are much more numerous. Builders' Hardware is in better demand, showing that building improvements are now being more largely made. Orders for fall goods have been placed to a considerable extent the past week for shipment in September, but this business is by no means as large as in previous seasons. Heavy Hardware jobbers report a multiplicity of small orders. They say that the complete figures for July will show a volume of business fully as good as July of last year, which is something they did not anticipate at the beginning of the month.

### Notes on Prices.

Wire Nails.—We have to note considerable inquiry for Wire Nails, with light and decreasing stocks, as almost all the mills remain closed. There is no change in prices. Quotations continue on the basis of \$1.15 for carload lots at mil, a figure which is, however, sometimes ahaded, but none of the manufacturers are willing to quote lower than \$1.10. The New York price for small lots from store is \$1.30 to \$1.35.

Advices from Chicago. - Manufacturers' agents report largely increased inquiries, but buyers are making a atrong fight for lower prices. Factory quotations are \$1.171 to \$1.20, Chicago, but counter offers have been made by buyers which are in some cases con-siderably lower. The manufacturers aiderably lower. are in auch position that if they do not throw away their advantages they will be able to control prices and compel buyers to come to their terms. Few factories are running and stocks are small. The demand from the country trade and from consumers is light, so that large buyers are in no haste to place contracts, and therefore the game of waiting may be prolonged for some time to test the strength of manufact-Small lots from store are selling at \$1.20.

Cut Nails—Business in Cut Nails has been light, with no alteration in prices and no change in the general situation. The Eastern market is represented by the quotation of 95 cents to \$1 for carload lots on dock. The

store price for Cut Nails in New York is \$1.10 to \$1.15.

Advices from Chicago. — The Lake Side Mill has at last been started up, after having been shut down for two months. It is now running single turn on contracts which have accumulated and a steady run is expected from this time forward. New business is not large but orders are coming in reasonably well. The trade now in progress appears to be entirely in the hands of local manufacturers. Factory lots are quoted at 95 cents, Chicago, on 60-cent average. Small lots from stock are unchanged at \$1.15.

Barb Wire.—There is extremely little doing in this article, as is natural at this season, and the situation remains unchanged, without either pressure to sell or eagerness to buy. The market is represented as at our last report by the following prices for Four-Point Galvanized, delivered at the points named: Pittsburgh, \$2.05 to \$2.10; Cleveland, \$2.10 to \$2.15; Cincinnati or Allentown, \$2.25 to \$2.30; Chicago or New York, \$2.25 to \$2.30.

Advices from Chicago.— Manufacturers and jobbers are doing very little in Barb Wire at present. No effort is being made to rush sales. Quotations on Galvanized from stock are continued at \$2.35 to \$2.40, with 10 cents less for carloads.

Berry Clothes Sprinkler.—A description of this Sprinkler was given in our last issue. It is put on the market by the Berry Sprinkler Company, 146 Franklin street, Boston, and is sold to the trade at 25 cents net.

The Lebanon Broiler.—This article, of which a description was given in The Metal Worker, July 28, is put on the market by the Seltzer Specialty Company, Lebanon, Pa. This Broiler is sold at \$9 per dozen list, subject to a discount of 33\frac{1}{3} per cent. to the trade.

Shot.—Owing to a shortness in the supply Pig Lead has advanced, and consequently manufacturers of Shot have issued the following prices to take effect July 27, terms net cash 30 days, or 2 per cent. for cash remitted within 10 days of invoice:

Per bag.

Glass—The condition of the Glass market as reported in our last issue remains practically unchanged. The demand for Glass is light and little is being done to stimulate business. While 80 and 20 per cent. discount is the quoted price on American Glass, at factory in carlots, it is understood that obtainable prices are represented by discounts of from 85 to 85 and 5 per cent. Imported Window Glass is quoted at 80 and 10 per cent. discount in any quantity. Plate Glass is sold at from 70 to 70 and 10 per cent. discount from Eastern list, according to size.

Old Metals.—There is only a very moderate demand for Old Metals, yet the market shows a firmer tone and prices are quite steady. The following quotations represent about the rates now paid by New York dealers:

now paid by Mew Tolk desicts.

#### Dignity.

The ability to control men falls little short of genius; it is an art that few can acquire. In just what it consists would be difficult to state, but certain it is that success in the management of men can exist only when there is respect upon the part of the men for their superior. Such respect can be gained and fostered only by the maintenance of a certain dignity that absolutely forbids stepping over the line into familiarity and yet withal does not repel. Some men while possessing all the other requisites of success seem to lack in just this one particular: They compromise themselves with their men, losing to a certain degree their respect and consequently breaking down that simple barrier. that unwritten law of intercourse that should serve to separate them. The dignified man need not walk erect and stiff necked, his countenance must not of necessity be always austere or his sentences short and sharp, with no humor in them. But he certainly must not descend into frivelity; he must in all his intercourse with his men say by his very acts and words: "Thus far shalt thou go but no fur-

#### Familiarity.

The descent from dignity is always into familiarity, and although it may not in all instances breed contempt it nevertbeless is certain to weaken the moral influence of the one who practices it. Although familiarity frequently appears to be a factor in popularity, it actually is not, and has no part in that true and proper popularity that is enjoyed by the few because they command respect and reverence. Many a man's downfa!l as a successful manager has dated from the time that, for some cause or other, he sought to be popular. He has doubtless endeavored to become so by a certain intimacy, a familiar slapping on the

back, a free conversation on an irrelevant subject. He has become too well liked from low rather than high motives, from expectation of favors or because unjustifiable favors have been granted. Even unintentionally the man sometimes places himself in an improper relation to the employer. Thus, a certain young timekeeper. out of the kindness of his heart, by extra work, made up his pay roll so as to pay off the day before Christmas, although wages were not due until Christmas Day, which, being a holiday, their pay day should go over to the day after. The men in appreciation made up a subscription which was invested in a fine meerschaum pipe and presented to him. He accepted it, but in so doing and by consequent intimacy with the men so compromised himself that it was soon deemed advisable by the management to find a substitute. In this is the lesson; familiarity must be avoided, dignity cherished and every effort made to secure the sincere respect of the men rather than the hollow popularity which is for the day and then, like a bubble, bursts and is gone forever.

#### Transportation Expedients.

Numerous instances are coming to light of the expedients to which Western business men were obliged to resort while the Debs embargo on railroad transportation was in full force and effect. Wherever considerable loss would have been sustained by a failure to deliver goods within a reasonable time, recourse was had to the rivers or to the few canals still to be found in some sections, or to the primitive method of teaming. A great deal of agricultural machinery was hauled long distances by wagen, because the strike occurred just when harvesting had begun, and there are always plenty of farmers who will not purchase machinery until they see that it is absolutely needed. These who paid the freight on these team delivered goods are in a position to draw comparisons which are strongly in favor of railroad transportation. Rivers and canals also proved poor substitutes for the steel roadway.

We are in receipt of a circular from H. M. Sanders, 227 North Calvert street, Baltimore, Md., stating that the Sanders evening school for sheet metal workers will open on the first Monday evening in September. Three lessons will be given weekly, on Monday, Wednesday and Friday evenings, from 7 to 9 o'clock, the pupil having opportunity for study and practice during the remainder of the week, the price being \$1 per lesson. The object of the school is to furnish a thorough course of instruction in the art of pattern development, instruction being given on the

intersecting line system, the circular or curved line system and the triangulation system. In addition to this, instruction in geometric, isometric and architectural drawing will be given.

#### Exhausting Smoke from Forges.

Improvement in the method of removing the smoke from the numerous forge fires in large smith shops has kept pace with other innovations, so that to-day we may note in many establishments the old time chimney connection from each forge completely removed and in its place a carefully planned system of exhausting the smoke by mechanical means. Advancement in this line has been rapid in the past few years until such arrangement now forms almost an inherent part of any complete equipment.

The inconvenience of the damp chimney flue that would not draw and the common difficulty of getting the smoke to move in the proper direction-i. e., up the pipe—while a fire was being started have, of course, been most important factors in bringing about the change. In the most recent arrangements as introduced in large railroad smith shops a single or double exhausting fan has been placed overhead on the roof trusses near the center of the building. From the inlet of each fan pipes are extended horizontally until they connect to the upright pipes from the forge hoods. These hoods, in some of the latest equipments, have been made double-a cone within a coneseparated some 1 or 2 inches and so arranged-with only a small hole at the apex of the inner cone—that considerable suction is created around the annular ring at the bases of the cones. The smoke, particularly at the time of starting up, is thereby prevented from curling down around the lower edge of the hood and thence escaping to the room with objectionable results. Obviously the hoods may be pyramidical as well as conical.

Such hoods can be readily counterbalanced and the pipe above arranged to telescope so that they may slide upward. Each pipe should be provided with a blast gate or damper that may be closed when the forge is not in use, and waste of power thereby avoided. The ordinary cased fan of the paddle type, as commenly employed for this work, is generally arranged to discharge directly upward through the roof, and is driven at such speed as to deliver smoke and air to rough the outlet pipe at a velocity of about 4000 feet per minute.

Of course the same or a similar ar-

Of course the same or a similar arrangement is applicable to all classes of open fires, in fact to all producers of smoke or objectionable gaseous fumes, and the product may be discharged at a distant point where its presence will not be disturbing.

# THE LETTER BOX.

Disease Germs and Ventilation.

From A. H. D., Minersville, Pa --There are several questions under discussion that are agitating this and other communities which I would like to have you give some information upon. In ventilating a crowded building by taking the foul air out of the rooms directly under all the floors and over all the ceilings (between the floors and eeilings) by down draft from the rooms, is there any danger of lodging the germs of disease on the rough lumber and the back of the plaster? If so, how is it possible to clean out these germ; of disease without tearing out the floors and ceilings? Would such a system of ventilation meet with general medical approval?

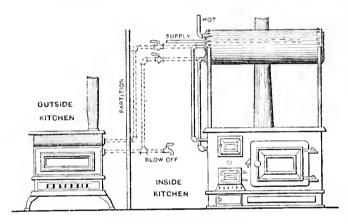

Note. -- It is a simple matter to answer our correspondent's first inquiry. If disease germs are floating in the air of a crowded room and the atmosphere is exhausted through rough plaster or timber partitions, such as exist between the floors and ceilings of a building, there is little doubt but that a great many of the disease germs will be arrested. One thing that should be borne in mind, however, is that the partitions of a building are usually absolutely dry and dust particles and all infinitesimal motes, such as disease germs, would not find such ready lodgment on a dry as on a moist surface. We do not know how to clean out these channels, p-o. vided they be polluted with disease laden air. It is possible some system of heroic disinfection, such as passing antiseptic gases or fumes through the passages, would kill the germs. We do not know what medical opinion would be on this general subject. There are certain phases of it, however, that may be considered simply from a commonsense standpoint. The ordinary ventilating flues, rising vertically from the top or bottom of rooms, are often of brick, which would collect disease germs in the same way as plaster and wood; therefore the between-floor ventilation is not in itself a dangerous practice. Another thing to think of is-so long as the current of air is outward the germs will not travel against it and there is no danger of them getting into the house. A disease germ is not a full grown animal with powers of locomotion and intelligence, but is an infinitesimal creation of which comparatively little is known at the present time. We are aware that under certain conditions they spread and propagate, but do not think the cholera germ, for instance, landed on a dry pine board, would create a colony inside of a century. If our correspondent looks

too minutely into the hygienic arrangement of dwelling houses and other buildings, he will discover a great many causes for alarm. All the furnishings on the walls of the rooms are receptacles for disease germs, while the upholstery of the seats in a hall are far better accumulators of disease germs than the partition flues he has in mind. Disease germs located on chair covers are subjected to more warmth and a moister atmosphere than they would be in the flues. The very dust of the floo: becomes laden with these dangerous atoms, and he must also bear the fact in mind that the ordinary indirect system of heating permits the accumulation of dust and dangerous parasites of all sorts,

to connect the pipes from the open side of the tee with the range in the outside kitchen. The two stops mentioned should be placed as near the boiler as convenient. A draw off cock must be placed near the water back in the outer range for draining the water back and pipes to prevent freezing in winter. To have the circulation free care should be taken that no traps are formed in either pipe.

### "Where Ignorance Is Bliss."

From A Tinner, New York State.— I would like to ask why so many foremen of tin shops dislike to be openly shown some new and advantageous way of producing patterns. I came across

Connecting Summer Range.

living and dead, upon the indirect radiators or in the drum of a furnace during the summer, ready for charging into the house whenever the fire is lighted. This is an interesting topic that our correspondent has brought forward and we shall be glad to have it discussed. We do not feel that the matter can be decided off-hand as to what amount of danger there is in the system of ventilation he refers to.

#### Connecting Summer Range.

From L. H., Philudelphia — Will you please describe a method for connecting the outside range with the boiler located over the range in the inner kitchen, as shown in the accompanying sketch? Two stops and wastes are to be used on the pipe to outside atove to shut off the water in winter. Will the stop be required on the inside range pipe to prevent circulation when the outside stove is being used? The boiler employed is of the horizontal type and lies over the top of the inner range.

Answer.—By using a tee instead of an elbow on each of the pipes that runs from the boiler to the water back on the inner range, it will be a simple matter

one in a city nearby who has been boss of the shop many years and, like many others I have met, bas an idea that he knows it all, and displayed his littleness and ignorance by refusing to look at a device for producing patterns that I was foolish enough to think would interest him, and astonished me with the declaration that he knew all about the device I wished to show him, although he had never seen it. I think a man like that would prevent The Metal Worker from reaching the boys in the shop if he could, but would read it on the sly and try to make the men under him believe that the information there gained was original with himself. Foremen of city shops have an idea that anything promul gated in a small town cannot be of interest to them. I think there is where many original and useful ideas come from. Some of the country mechanics have good heads and all the good heads are not carried on the shoulders of city mechanics. Country boys have more time to study and to solve the different problems which The Metal Worker produces so completely. I have an apprentice who would not be puzzled in the least to draw the few lines to get that cold air box that aeemed to have bothered "A. L. M." and his friends in the big city of New York; and, no doubt, foremen of the kind mentioned would be able to do it without looking. I am. inclined to believe that the proper way to approach these high and mighty men is to do so in the dark, so that no one will see them receive the instruction that they certainly need.

#### Wind.

From GEO. M. BARR, Pittsburgh, Pa. -Once upon a time, not long ago, a gentleman informed me that he had a furnace in his house which was about the poorest apology for a heater he had ever seen. Its sole ambition seemed to be to keep the cellar at a torrid temperature, and in this it succeeded beautifully. Visitors were always greatly surprised when told there was a warm air furnace in operation in the house, but a trip to the cellar never failed to remove any doubt. In three months' time this insatiable monster consumed 31 tons authracite coal and \$32 worth of natural gas, and all the owner had ever received in return was a piping hot cellar and the fuel bills. Various mechanics had advised in the matter, one claiming the warm air pipes were too small and should be replaced by larger ones. His suggestion would probably have been acted upon had not another fellow declared the pipes were too large, presenting to the cool cellar air so much surface as to cause the warm air to become chilled before it reached its destination. The pipes were 8 and 9 inches in diameter. As we parted the gentleman casually observed that he wouldn't care if the whole ap paratus, including the man who set it up, was in a certain locality where heat is popularly supposed to be a drug on the market. He requested me to go out to his place, and I went, knowing there was something wrong with the cold air pipe, which I decided to look into and render a bill for so much per look. But no cold air pipe met my gaze. There wasn't any. Excepting leakage, reduced to a minimum by tightly fitting casing, there was actually no fresh air supply to that furnace, nor had any provision ever been made for

Two thirds of all the trouble in unsatisfactory furnace jobs which I have investigated were traced to some defect in the cold air supply. The average tinner generally overlooks this most important connection, usually devoting his whole attention to the warm air pipes, location of regulators, &c. I saw a furnace last winter carrying an aggregate of 585 square inches in area of warm air pipes, and the cold air pipe was 12 inches in diameter, equal to 113 square inches. Even the plasterers working on the building predicted disaster for that heating contractor.

I remember an instance in San Francisco, several years ago, when I was re quested to look at a furnace in a large city residence, and if possible discover why it failed to heat the house. The furnace was a large one, fully capable of carrying the 12 lines of pipc connected to it, provided the cold air supply was sufficient, which I decided was not the case. With a stiff breeze blowing from the right direction I found that not even a gentle zephyr was wafted through the cold air pipe, which was carried under cellar floor to a pit beneath the heater. I had the cement taken up over this duct, revealing a wooden box, the cover of which was removed, and there about the center was the cause of all the trouble and considerable profaulty. The intelligent workmen who had cemented the cellar had dumped all the surplus sand into the box, completely filling it up at this

point. While we were getting down to the supply pipe the Chinaman who had charge of the furnace made his appearance and I asked his opinion of the

"O gee cli," be answered; "him no goodee. No likee. Pokey, pokey; skakey, shakey; alleday, alle timee. No make 'm lite. You sabbe fixe? No can do it. One man he come one day fix 'im pipe. To mollow nudder man come fixee alle samee first time. He alle samce bum flunace.'

Two weeks after our conversation above I met John, and he smilingly velled out:

"Heap good! Heap good! You alle

samce sabbe; you bette.'

A furnace we put in two winters ago was reported to us shortly afterward as not giving sufficient heat, the party claiming that with a good fire not more than one room could be heated at the same time. I went up to see about it and found the owner at home. On our way to the cellar he informed me that he alone attended to the heater, as he had been around furnaces consider ably, and never permitted the women folks to meddle with it. He was not exactly sure what the difficulty was, but had an idea, which I allowed him to retain, since it was his, and as at that moment we reached the furnace room and I saw the slide in the cold air hox was tightly closed. I called his attention to it, and he said: "Oh, yea; I close that. The house is cold enough without permitting more cold air to enter through that pipe. I can't understand why it was put there. I keep the slide closed all the time.'

Well, not having an axe or acything handy, I could not kill him, so I opened the cold air damper, filling the house full of warm air instead of cold, to his complete astonishment, and then I proceeded to fill him full of cold air, oxygen, carbonic acid, sulphuretted hydrogen, burnt out fire pots for the want of some of the above, &c, and to this day, whenever we meet, he gazes at me with admiration and awe. I went to see a furnace some time ago which had given the owner considerable trouble. It was a small affair, supplying three registers through as many 8 inch pipes. The cold air pipe, 12 inches in diameter, dropped down from the joists and disappeared in the ground alongside the furnace. The owner said that was all right as there was an air well under there, which he considered was the proper thing to considered was the proper have. A careful investigation failed to discover anything wrong with the pipes above ground, so I concluded to examine the pit under furnace. Removing cold air pipe I found, Instead of a well as he called it, that the furnace had been set on several bricks scattered about under the base ring, and a shallow channel scraped out under the cold air pipe. The whole had been covered over with cement, which gave the heater the appearance of resting on a solid foundation or the wall of a pit. There was a space just 2 x 12 inches under base ring, in the channel, for the air to pass into furnace, and it did not take long to convince the owner that the amount of air that would pass through a pipe with a cross sectional area of 113 square inches would have a hard tussel getting through an opening 2 x 12 inches.

Two-thirds of the trouble with fur-

naces, as before stated, I find in the cold air supply. The other third-and sometimes it seems as though there were several thirds—is due to other causes. The most remarkable plan of

construction that I ever ran across was met with ln the northern part of this State on a church building of 50,000 cubic feet volume. The church had never been heated satisfactorily, or any other way, in fact, and a new apparatus was to be contracted for, and that is what brought me there. They desired all the old warm air pipes used, as they were in good condition. I found in this church, which for three years had been fairly yearning to be heated, two sma'l brick cased furnaces, each carry. ing two lines of 5 inch warm air pipes connected to as many 14 x 22 registers scattered about the auditorium floor. The shortest pipe was 18 and the longest 34 feet in length, and I estimated that a charge of air occurred once in something over seven and a half hours. On receipt of this informstion the entire committee exclaimed, as one man, "that is not enough."

It is not. I got the job, but I did

not use the old pipes.

#### Repairing Agate Ware.

From H. M., Frankfort, Pa.-Will some reader of The Metal Worker please tell me of another way to repair agate or enameied ware than to solder it? What cement would stop leaks around the spout, &2., and withstand the action of fire and hot water?

Note.—We will be glad to hear from any of our readers who have a method of stopping such leaks other than so !dering.

#### Alumiuum Boats

The use of aluminum in the construction of torpedo boats and other craft designed to attain a high rate of speed with lightness of build is receiving considerable attention from European naval authorities. A new tor-pedo gunboat built for the French Government is thus described and com mented upon by the British Naval and

Military Record:

The boat is constructed of aluminum and its extreme lightness will allow of its traveling at the rate of 31 knots an hour. This speed will beat the record, which at the present time is 29.3, obtained by the new Thornycroft torpedo gunboat trials a few days since. There is no doubt that aluminum is the coming metal, and will be used a great deal in ship construction. As the little launch, which came out at the Henley regatta. can move as fast as other launches of the same size with half their power, it is fairly certain that it will supersede the present brass fittings of the forpedo gunboats, which are very weighty. Another matter to be borne in mind is the fact that it will be possible to carry more coal if the boats can be made lighter in construction.

The London Times states that Hiram Maxim has constructed a flying machine in which he and two others have siccessfully accomplished a flight of 500 feet. The machine is about 100 feet wide, has four wings and is propelled by two screws, which are driven by two compound engines.

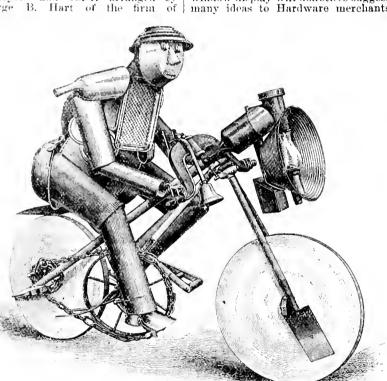

At length the vexed question of a site for the new mint in Philadelphia has been settled. Secretary Carlisla last week selected a site on Spring Gar den street, for which \$305,000 will be

# THE RETAIL STORE.

#### "Household Wants, '95 Model."

The accompanying cut represents a bicycle and rider, arranged by George B. Hart of the firm of

than an elaborately and handsomely dressed window. The design appeals to all beholders, as the goods used are familiar and in everyday use. This window display wilt doubtless suggest many ideas to Hardware merchants

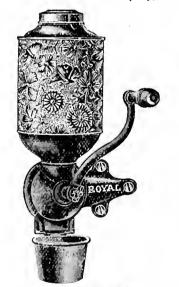

Household Wants, '95 Model.

George O. Hart & Son. Paducah, Ky., as a window display. The firm intended leaving it in the show window for a week, but it proved such an attraction that it was allowed to remain on exhibition much longer. The cycle was labeled "Household Wants. '95 Model." and at times drew such crowds that they filed the pavement and a portion of the street. The wheels of the machine were grindstones, the front sprocket a wheel barrow wheel. and the rear sprocket a lard press screw head. The chain on the sprocket wheel was formed of stay chains, and for the step a No. 4 broad axe was used. The npper frame bar was a post hole digger, the lower frame bar a four tine D-handle manure fork and the seat was a molder's shovel. For the front fork two boys' spades were used, with a screw wrench for the front axle. The handle bars were a No. 4 bell yoke, with an engine bell attached, and a side lamp for a lantern. The crank arms were sansage meat cutter cranks, and the pedals were rat traps. The rider had a pudding pan face can screw eyes, a coffee spout for a nose and a patty pan for hips and teeth. Four dish pans were used for the rider's body, grocer scoops for shoulders, conductor pipe for arms, stove pipe for legs, pint cut s for heels, small grocer scoops for feet, garden weeders for hands, a nickeled tray for shirt front and a japanned wash pan for a hat. The selection and arrangement of the articles in making up the exhibit is unique to a marked degree, and probably attracted more attention

which can be worked out and result in much benefit to them.

#### New Royal Pound Mill.

The coffee mill here shown is offered by the Arcade Mfg. Compsny, Free.

New Royal Pound Mill.

port, Ill. The mill is made of cast iron, finished in black enamel, and furnished with a fancy embossed sheet metal hopper. The fact that the mill fastens to the wall is a feature to which

the manufacturers give prominence. They state that the hopper will hold a pound of coffee; that the coffee will be kept air tight, and that the mill is supplied with improved grinding burrs which do the work rapidly and with ease.

#### The Unique Skewer Puller.

The accompanying cut represents a skewer puller put on the market by F. W. Hall, 178 Broadway, New York. In use the tinea of the carving fork are

The Unique Skewer Puller.

thrust into the roast, with a tine on each side of the metal or wood skewer. The loop of the puller is placed over the exposed end of the skewer, and twisted slightly to loosen it, after which a pull on the handle of the puller draws the skewer. The pullers are furnished in steel, nickel plated; steel, silver plated, and in solid nickel silver.

#### The Sloteman Gas Burner.

The accompanying illustrations show gas burner manufactured by the O. T. Sloteman Company, 39 Court street, Buffalo, N. Y. Fig. 1 presents a general view of the burner, the gas and air mixer appearing at the right. The burner is constructed with two cham-bers, one above the other. The gas and air entering at one end of the top chamber pass along its entire length and then down to the chamber beneath, where it flows from the holes indicated in the engraving. By this method, it is claimed, the gas and air are heated to a high temperature before they are brought to the point of combustion. In Fig. 2 is shown a sectional view of the mixing chamber. Attached to the gas valve is an eccentric shaped casting, its operation, raising or lowering the door governing the air supply, in-creasing or diminishing the supply of gas and air as desired, and maintaining, it is claimed, an evenly proportioned mixture capable of producing an in-tensely hot flame with an economical consumption of fuel. The gas enters through the side of the chamber and passes to the mixer, as shown, so that when the stop cock in the supply pipe is turned on a small quantity of gas and air is mixed ready for burning. To inair is mixed ready for burning. To increase the supply of gas it is simply the end of the regulator is drawn from the orifice of the chamber in which it works. This burner is said to overcome the difficulty of flashing back, and the

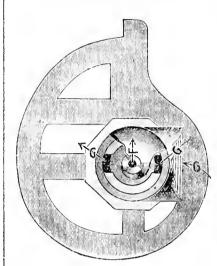

Fig. 3.—Eccentric and Air Regulating Chamber,

heating of the gas and air previous to burning is said to effect an economy in the consumption of fuel, while, at the same time, a flame of greater heating

O.T.SLOTEMAN
PATGAPPLOLFOR

The Sloteman Gas Burner.-Fig. 1.-General View of Burner.

necessary to turn the eccentric to the right to open the gas valve by removing the end from the crifice of the chamber in which it works, thus permitting a larger volume of gas to enter. The coarse screw with which the gas valve works being cut away at two different points and the amaller tapering point of the valve render this operation possible. Fig. 3 illustrates the ec-

efficiency is secured. The burners are made in six sizes adapted for use with tubular boilers, not air furnaces, ranges, stoves and wherever heat is required.

According to the Baltimore Journal of Commerce, it appears that not one American steamship has been loaded at that port during the last four years. In connection with this fact the Journal re-

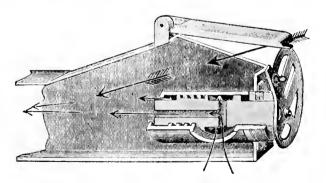

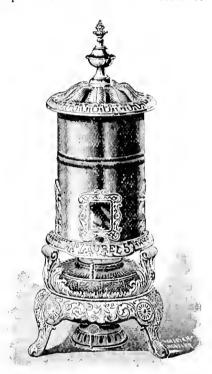

Fig. 2.—Sectional View through Mixing Chamber.

centric for regulating the air, and shows the chamber which permits an increased flow of gas to the mixer. F represents the orifice, which is always open during the operation of the mixer, and G G indicate the points on the coarse ecrew of the gas valve that are cut away, permitting the gas to flow through when marks that in 1860 upward of 66 per cent. of the export and import trade of the United States was carried in American vessels, while in 1893 that quantity was reduced to less than 12 per cent. Statements of the value of goods exported from Baltimore for the three fiscal years ended June 30, 1894, show

that out of \$98,796,856 exported for the year ending June 30, 1892, only 1.53 per cent, was carried in American vessels, while 1893 and 1894 were 1.47 and 1.76 per cent, respectively. This presentment argues the necessity for a change in the present navigation laws.

#### Art Laurel Oil Heater.

The accompanying picture of the Art Lanrel oil heater shows one of the original designs that has been patented by the makers, the Art Stove Company, Detroit, Mich. The stove is not only handsome in appearance, but is claimed to be a very powerful heater, having a full 9-inch wick. The esstings are full nickel plated, making a pleasing contrast with the planished iron body, and a very cheerful light is shed through the mica windows when the stove is in operation. The reservoir is made of

Art Laurel Oil Heater.

very heavy brass, richly ornamented and so arranged that it can be readily removed for cleaning or filling. The hody section hinges to the base, so that the burner can be easily exposed for trimming the wick and for adjustment. All the parts are interchangeable, and the stove is claimed to be a strictly high grade article.

The farmers of Indiana are feeding wheat to hogs and selling their corn. Wheat brings only 43 cents a bushel, delivered at the country stations, while corn sells readily at from 45 to 47 cents a bushel. The farmers say that as wheat contains twice as much nutriment as corn, and hogs are fetching good prices, it is an economy to feed the wheat to the hogs and sell them and the corn.

According to the Textile World, the effect of the late depression has been illustrated in the diminished construction of new textile mills. Only 58 mills were completed during the half yesr ended June 30, 1894, compared with 110 and 135 for the same periods in 1893 and 1892 respectively. The bulk of new construction has been in the Southern States

# PLUMBING and GAS FITTING.

### Gas and Gas Fitting.—V.\*

BY J. W. HUGHES

#### Inspection of Material and Work,

Having introduced the service and connected the meter it is next in order to take up the question of the sizes and distribution of the different pipes for the convey ance of gas from the meter to the different fixtures, stoves, fire places, &c., in a building.

Before so doing a few general hints as to conduct and procedure will be in

as to conduct and procedure will be in order. The rule for the successful gastiter to observe, first, last and all the time, is to be eareful. It is much easier to find a sand hole, or a defective thread, in a fitting when it can be held in the hand and carefully overlooked than it is to find the same hole when the fitting is in place, and that place usually the most awkward place possible, perhaps behind a beam, or covered by flooring or lath and plaster. And, having found it, the cost of its removal and replacing, or otherwise making good the defect, is at least tenfold what it would have been had a little care been taken to find the defect be fore the fitting in which it exists is put in position.

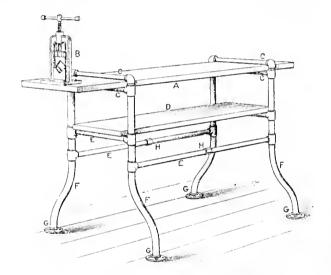

The same remarks apply to choked or split pipes, or pipes having a defect in the thread. Some leaks are the result of the work entailed in fitting the tipes in position, but the greater portion of them are defects in the material that can be found at the proper time—viz., when the pipes are being handled at the bench. An excellent plan is to treat the smaller malleable fittings—that is from ½ to ½ inch, as if they were all defective, by coating them with an asphalt varnish. Tats is quickly and inexpensively done in the shop by put ting a quantity of the varnish into a large pot; a big solder pot answers very large pot; a big solder pot answers very well, warming it sufficiently. Do not get it too hot or a very ugly fire will be the result. Then, having strung the fittings on a wire, dip them into the warm varnish, letting them remain until they have become as het as the varnish. Lift them quickly out, shake violently, and hang up to harden. This method effectively disposes of the little, almost invisible sand holes so common in small fittings, even when made by in small fixtings, even when made by the very best of makers. Before doing this the fittings should be looked over for any of the more serious defeets, such as poor threads, large hole, misshapes, &c. An experience of many years in the use of gas fittings, made by the best of makers, American, Canadian and European, warrants the statement that the taking of the foregoing precaution

pays in time, temper and reputation.

Never let a new job out of your hands until it is certain that it is tight. A pump for testing costs little and will save its cost on one job. Having applied it, heed the lesson it teaches and never give up until the job is tight beyond question. I write this for the benefit of fitters in small shops, and

such places as may be without superin. tending foreman or gas inspectors, and knowing from personal experience how strong the temptation is to pass over a smill leak, the only evidence of which is that the pump gauge will not stand. It is wearisome to spend hours climbing about a new building looking for something that can nelther be seen, smelt nor felt, yet which you know certainly exiets. But it is a much more serious matter to have to hunt for a similar leak in a finished building. Carpets to raise, thors to take up, plaster to break, fixtures to remove, and last, but not least, a justly indignant housewife who drops in every few minutes and helps the worried gas fitter keep his temper by making nice, pleasant remarks. Find the leak and make the job tight

ous processes of construction that follow the fitting of the gas pipes, a gasalier will not hang plumb, nor a bracket set parallel, unless the nipple and drop are properly act. See that drops are a proper length to suit the center piece. If the exact depth of centers cannot be ascertained have the drop so set that it can be easily removed and replaced. Make proper allowance for projection of nipples for side brackets beyond plaster, so that the bracket will screw on with the ordinary back plate and make a proper and neat connection. Be especially careful to set bracket nipples (when there are two or more on the same wall) at an equal hight to a 12 inch. A slight variation in hight may be un. noticed by the eye in an unfinished building, but the difference be quite

Gas and Gas Fitting .- Fig. 13 -Gas Fitters' Bench.

every time is the only rule. There is no short cut for any one worthy the name of a gas fitter.

Having got the job tight every care must be taken to see the pipes are in such a position that they will not be injured by any of the work to be done after they are placed. See that due allowance is made for any settling that may take place which may break a pipe, and that floors, base boards, architraves, mantels, laths, furring, &c., may be put in position without coming in contact with the gas plpes in such a way as to injure them. I have seen a carpenter laying flooring take the back of his axe and hammer a gas pipe out of the way, this being easier and quicker than taking the edge of the axe and trimming off the floor so as to make room for the pipc. The gas leak was "none of his funereal;" he was only interested in lay-ing the floor, and if he was doing it piece work, so much a square, as is frequently the case, he had no time to waste In nice trimming to mect the shortcomings of the gas fitter. See that the pipes are well secured, especially those pipes that have to carry heavy gasaliers or brackets.

Take care that nipples and drops are plumb and tight, and so secured that they will stay so. During all the vari-

discernible when the walls are finished and the brackets in place, especially if walls are decorated to an exact pattern. Be certain the drops are in proper position in the center, or otherwise, as the case may be. To ascertain the exact place is sometimes difficult, and the architect, plasterer or decorator may have to be consulted. The right way to take ceiling centers is a very much disputed point, especially when there are breaks or projections to complicate the problem. But it is the gas fitter's duty to ascertain as definitely as possible what is to come in the way of interference after he has finished his work.

#### Laying Out Piping.

Avoid as much as possible the placing of pipes on outer walls, or in such positions as may be cold or subject to drafts from around door or window casings. Where a pipe must be placed in such a position a little time spent in wrapping the pipe with building paper, wrapping the pipe with building paper, calking cracks with oskum, or taking other precautions against the cold walls or drafts coming in direct contact with the pipes will be well and profitably spent. Remember it will be difficult, if not impossible, to attend to such things after the building is completed. Run the pipes with a fall

Opprighted, 1894, by David Williams.

toward the meter. If this is not possible they must be laid at least level. Where this cannot be done for the whole job it can be done in sections, or the pipes or certain branches be run with an incline to a suitable place and a drip pipe and cock be inserted. These precautions are especially necessary when gasoline gas is used, or any gas which is simply a vaporized fluid, sure to return to its original form on application of cold.

If there is a plan to work to, study it carefully before beginning operations. Ascertain the relative position of the different openings one to another, and be guided in proportioning your pipes to what may be expected from them. A large room will certainly have a large gasalier hung from its center drop, and while § inch may be, as a rule, considered right for ordinary drops, it would not do to fit so small a pipe for a ballroom or reception hall. Use common sense. If you have it not, get it as soon as you can. A celebrated painter was asked with what did he mix his colors in order to get the beautiful effects characteristic of his work. His reply was—brains. That's it, brains are what is wanted in the gas fitter's head. If he has not got them in the regular way, then he had better quit the business and go at something where mere mus

cle is all that is necessary.

A plan was mentioned. The usual plan a gas fitter has to work to is the ordinary building plan, showing the lay out of the various apartments, with a small cross or circle in certain places that stand for the gas openings. plan showing the various sizes of the pipes and the way they are to run is something the writer has yet to see coming from an architect's office. generally covers his retreat by inserting a clause in his specification that reads:
"The gas is to be run to the various halls, rooms, passages and other apartments as shown on plans. Pipes to be of iron, well put together, screw joints and red lead. To be perfectly tight. The whole in accordance with the gas company's rules and regulations.

Such being the case the gas fitter had better mark the pipes in the plan for study the situation, then proceed to mark on his sizes. Gas companies' rules do not always work out right. Having thoroughly studied the plan and got into your head what is expected, take your plan and go around the building and with chalk, mark the different posi tions on the walls, floors or studdings. By the time this is done any fitter of ordinary intelligence should be ready to commence the actual work of fitting the pipes.

#### Gas Fitters' Tools.

This brings us to the question of tools for ordinary jobs. A kit of piping tools from 2 inches to 4 inch will suffice, consisting of the different stocks and dies, the latter right and left, and suitable tongs. Some form of dies that make the thread with one cut are the best, and the ordinary piping tongs will give the best results. Too much time is lost in new work in handling shifting tongs. A couple of pairs of each size tongs from 1 to 1 inch are desirable in a good kit in order that one pair may be laid aside for repairs while the other is in use. It does not pay to handle pipe with tongs that have lost their shane or edge by use. There are some forms of dies better than others; those that while making a full thread by being once acrewed on to the pipe, permitting of adjastment, and sharpening when necessary, are the best. good vise, with a sure grip jaw and a quick working thread is indispensable, also a bench on which to put it. The handlest bench for a gas fitter is one made of iron pipe of such a siz: that it can be easily carried in a wagon and be handled by the fitter and his helper. This bench, shown in Fig. 13, can easily be made by the fitter and will be much better than sticking the vise on a board and supporting it on a couple of boxes or a barrel, or any other makeshift device, or screwing the visc to an upright plank jambed between floor and ceiling, or securing it to studding, as is frequently done.

In the sketch, Fig. 13, A is 1½ inch plank, about 1 foot wide. B, visc screwed to plank (bolted). C, C, C, C, cross pieces of 1 inch gas pipe put to-gether with right and left screwed pipes and fittings, just wide enough apart to receive plank A snugly. D. plank laid on lower cross brace E, and is handy to lay tools on. E, E, E, cross and longitudinal braces, put together with right and left threads for securing and bracing the legs F. G, flanges

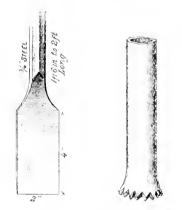

Fig. 14.—Floor Raising Chisel.

Fig. 15.—Wall Boring Tool.

that may be acrewed to floors when necessary. When it is desired to have necessary. a long bench, right and left buckles may be inserted at H, which permits of the bench being handily separated. An ordinary bench will be strong enough if made with 14 pipe for the legs, the braces to be  $\frac{3}{4}$ . For heavy work the legs may be made of 2 inch pipe and the braces 11 inch.

In addition to the ordinary pipe tools a tape line is necessary; also a good handy saw and a lock saw and an assortment of chisels and jumpers for cutting into and through walls and wood work, a long gimlet such as bell hangers use, and, where beams are to be bored, a ratchet brace and an assortment of auger b'ts, such as are used by steam Should floors have to be raised a specially made floor lifting chisel is I: must be made of good desirable. steel, the blade 2 inches wide and the handle 1 foot 6 inches to 2 feet long, as shown in Fig 14 A chalk line and a strong tool box with a good lock and key are indispensable; also a handy atep ladder.

A very serviceable tool for making the smaller sized holes through blick walls, when bricks are not too hard, is made from a piece of iron pipe, the end being enlarged (made trumpet mouthed) and the edges notched. This tool, Fig. 15, when struck with a hammer and constantly revolved, soon makes a clean hole through an ordinary brick wall. But care must be exercised when the wall is nearly pierced not to knock out a brick from the side of the wall opposite which the work is being done. This is a very handy tool for use on old work, as it saves amashing of plaster. It is not, however, of much use for pipes over \( \frac{a}{4} \) inch, being too clumsy beyond that size. A similar tool made out of thin brass pipe serves to clear away plaster from around a nipple or drop that it is desired to remove and that has been plastered in. In the latter ease it is simply turned by band. A gas fitter's torch and blow pipe is useful in applying gas fitters' eement. At one time it was customary to put all the joints together with cement, but of late it has The cement joints been abandoned. required great care and time, and unless well made were liable to be eracked and cause loaks. But the cement is very useful in making repairs of small leaks or putting together the parts of gas aliers and for similar operations.

#### Wolff's New Steel Sinks,

The L. Wolff Mfg. Company, 93 to-117 West Like street, Chicago, have put in a complete plant for the maniseture of drawn steel sinks, and are now making a full line. These sinks are furnished painted, galvanized or enam-eled as may be desired, and of two kinds, which have been named the Anchor and the Diamond brands. The Anchor brand is made from heavy stock, and has Wolff's parent brass outlet connection. The Diamond brand is lighter and has the collar connections, as on the ordinary cast iron sinks. These sinks are not liable to break in use or in transportation. The company have just issued a particularly handsome circular treating of these sinks. It has a heavy paper cover, ln pale blue, with embossed gilt title. The contents are printed in two colors. The styles of sinks are illustrated, pricelists and code words are given, and full details are shown of the several kinds of outlet connections. These have a clear and full sized waste way, with no bars or grates under the strainer. If the waste pipe should become obstructed the strainer can be removed without disconnecting the pipe to insert the hose of a force pump. A plug or stopper waste is also made, which can be used in place of the strainer to hold water in the sink if that should be desired for any purpose.

#### TRAPS AND VENTS.

A. Lincoln Moody entered upon his duties as plumbing inspector of Waltham, Mass., last week. He has had 14 years' practical experience.

SMITH & BURNHAM is the name of a new firm in the plumbing business at Littleton, N. H.

GEORGE H. FARRELL, Westfield, Mass., has opened a plumbing shop at Ches'er as a branch of his local business.

UP TO AUGUST 1, at Detroit, Mich., 124 master plumbers had been examined as to their qualifications to carry on the business of plumbing. Of this number 97 have passed the examination, certificates of competency having been refused the rest. There are about 15 master plumbers in the city who have not been examined. There are proba-bly 100 journeymen plumbers in the city, but 15 of these have been exam-ined. Five of them were refused certificates.

THE UNION SOAPSTONE COMPANY, 14 Marshall atreet, Boston, Mass., find a lively market for their soapstone specialties in New England. In addition to making a line of sinks and laundry tubs they make all sorts of stone work for plumbers' use. They also supply cake griddles, soapstone wood stoves, open grates and funnel stones intended for use in the floor for all sizes of stove pipe; also a wide line of register frames and borders.

Plumbing Inspector W. A. Ford of Cambridge, Mass., is much pleased with the result of his first six months' work and states that the plumbing that has been done has been of an improved character.

THE BOARD OF HEALTH OF Reading, Pa., are taking steps to have the plumbing and drainage work done in the city inspected by a qualified officer.

PRESIDENT JOHN MITCHELL of the National Association of Master Plumbers telegraphed official greetings to the convention of Journeymen Plumbers, Gas Fitters, Steam Fitters and Helpers held at St. Louis last week.

THE TINNERS' MACHINERY & SUPPLY COMPANY, 9 Cliff street, New York, issue a circular of the Empire blow pipe intended for plumbers' use in wiping seams in tanks and melting fittings from old pipe. Mention is also made of the full line of plumbers' fire pots, for gas and gasoline, and tools carried by this concern.

A POTTSVILLE, PA., PAPER speaks of the opening of a permanent shop by Plumber Sayder, at Tremont, Pa., as a worthy enterprise.

Andrews & Peck are opening a plumbing and gas fitting store on Fifth street, Fremont, Neb.

THE MASTER PLUMBERS of Florida met last month and formed a State association of master plumbers, which includes nearly every master plumber doing business in the State. The association has affiliated with the National Association and received its certificate of membership on August 3. The officers for the ensuing year are: President, J. E. Kuchler, Jacksonville; vice-president, Geo. H. Fernsld, Sanford; secretary, John Einig, Jacksonville; treasurer, R. E. Yonge, Ocals.

A 90 PAGE CATALOGUE is just being sent to the trade by Fred. Adee & Co., New York, in an embossed leather cover of fawn color, with the address of the house in silver gilt. Without a title page or trade address the first page shows the newest water closet made by the house—the Duplex, which is claimed to have special features of excellence, working with the flush tank but 3 feet above it and made of vitreous earthenware. Several styles of the closet are shown, followed by the Purus front and back washout closet, the Capital siphon closet, the Shamrock, Volunteer and Nerens closets. Various kinds of flush tanks and seats are shown, and several pages illustrate Ilyde's extension water closet. The Perfecto leads a line of urinals, followed by a variety of lavatorics and basin traps and fixtures. Next are wash trays and their fixtures, then several pages are devoted to enameled baths, and the last pages to plumbers' brass work and porcelain sinks.

W. F. RABENAU, Iowa City, Iowa, has removed his plumbing establishment to the Mendenhall (McLaughlin) Building, across the street from his former location.

THE PLUMBERS of New England are well acquainted with James Barrett, 193 Tremont street, Boston, and his

goods. He manufactures a line of sanitray specialties, some additions to which are about to be made. A new catalogue is in course of preparation.

Sumner & Goodwin, 15 Oliver street, Boston, are one of the New England plumbers' supply houses carrying wrought iron, cast iron, brass and lead goods of every description called for by the plumber and pipe fitter.

In The Metal Worker for July 21, we referred to the Onondaga hathtub as made by the Pierce, Butler & Pierce Mig. Company of Syracuse. N Y. This was an error, as the tub is manufactured by the Steel Clad Bath Company of New York, although it is sold by the Pierce, Butler & Pierce Mig. Company.

MANAGER F. W. WEBB of the Henry McShane Mfg. Company, Boston, is always pleased to show his sample room to visitors, being one of the handsomest in the city devoted to plumbing goods. The floor is mosaic tile, the center being of a dark pearl tint and the border a maroon. The ceiling is embellished with bas relief ornamentation, and is finely frescoed. The side walls are wainscoted with file. An impression of spaciousness is given to the room by the use of two mirrors at the back of the apartment. In the center of the room an arch leads to two handsome bathrooms, the gold room being reached through an arch decorated at the top with a grill, to which are attached handsome portières. In the room proper a handsome mirror hangs over an onyx lavatory with gold fixtures, while at the back of the room is located a roll rim bathtub, properly fitted, and at one side is a Roxbury water closet. In the blue room the ceiling arches from three sides to a common center, entrance to the apartment being effected through an arch supported by Italian marble colnmns. The ceiling of the blue room is appropriately frescoed and decorated, while at the back is a white porcelain bath and at one side a laystory with French mirror set in a pale blue frame. At the opposite side of the room are arranged a Sitz bath and lavatory. In the main asmple room, along the wall on one side is a varied and handsome line of water closets, while different styles of lavatories are shown on the opposite side. A handsome lavatory, called the Radcliffe, is so arranged that the overflow can be readily cleaned. They also show an automatic before and after wash hopper closet, designed for school

WM. WILEY, Gardiner, Maine. will move into the Charles Wakefield Building, two doors east of his present location, and will make a specialty of plumbing in the future.

P. L. LYONS of Montpelier, has opened a plumbing shop in the store formerly occupied by A D. Pratt, at West Randolph. Vt, with Henry Fisher, also of Montpelier, in charge.

Additional floor space having been devoted to the plumbing department of the Smith & Anthony Company, Boston, Manager W. H. Lloyd has arranged the Sanitas specialties in a manner calculated to display the goods to the best advantage and prove most attractive to his visitors. The Sanitas Regal water closet is set up so as to show its operation, and various patterns of enameled baths are displayed on the floor. By the use of a triangular display frame three lavatories are shown in a little more space than is required for a single fixture when exhibited in the ordinary manner. The top is also used for

displaying ornamental lavatory bowls. Through the efforts of Mr. Lloyd the Sanitas sample room is one well worthy of a visit.

Frank R. Rafferty and Patrick F. Moriarty have formed a business partnership and bought the plumbing and steam heating business of E. H. Holmes & Co. at Willimantic, Conn. The firm name will be Moriarty & Rafferty.

JOHN FREITAG, formerly of the firm of Freitag & Witterberg, plumbers, has purchased the late William P. Hoctor's establishment at 12 South Sixth street, Terre Haute, Ind.

The Board of Examiners of Plumbers at Baltimore, Md., last week examined a number of applicants for registration. The total number of registered plumbers is 323, which is more than 100 less than were certificated by the board during the first year the law went into effect. Members of the board express the opinion that unregistered plumbers are engaged in doing work, in violation of the law, and stated that steps would be taken to have some of them arrested.

JOSEPH H. SOUDEN has opened up a new plumbing establishment in room No. 518 in the new property of Henry Eberwine on Main street, Vincennes, Ind.

An interesting meeting of master plumbers was held at Asbury Park, N. J., recently as a result of the call issued to the Monmouth County, N. J., plumbers by State Vice-president John Hickman.

STATE VICE PRESIDENT JOHN HICK-MAN of Paterson, N J., visited Passaic, N J., on Thursday night and a flourishing association of master plumbers will soon be in operation there as a result.

#### Small Arms Tests at Newport.

The important competitive tests of small arms for the naval service, which began at the Naval Torpedo Station, Newport, R I.. on August 1, will be watched with much interest by foreign powers as well as by the naval and military authorities of this country. On the result of these trials will rest the decision of the Navy Department as to the best type of weapon with which to equip the sailors and marines of the United States Navy. In March last, Secretary Herbert issued a call to inventors for a breech mechanism to serve the small caliber, 0.256 inch, barrels adopted by the Naval Ordnauce Department, and offering to furnish new barrels for experimental purposes. Twenty-seven of these barrels were furnished by the Government, many of them to leading makers of small arms. Considerable interest is expressed in the character of the various devices sub-The first order for the new mitted. rifles will probably amount to 15,000 weapone, and it is believed that a me important improvements in small arm eflictency are likely to have been called The tests at Newport will be forth. exceptionally severe, safety, general action, defective ammunition, excessive charges, rapidily, accuracy and ability to stand dust and rust entering into consideration. The endurance test will be 500 continuous rounds without cleaning, and the facility with which the breech mechanism and magazine system can be completely taken apart and put together will be noted.

## HEATING 20 PLUMBING.

### NEW WORK AND CONTRACTS.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until August 29, for a low pressure, return circulation, ateam heating and ventilaring apparatus for the United States Post Office Building at Galesburg, Hi. Drawings and specification may be obtained from the Supervising Architect, Washington, or from the superintendent at Galesburg, Ill.

E. H. BAGLEY, White River Junction, has the contract for heating the Graded School at Northfield, Vt., instead of at Montpelier, as previously stated.

THE NEW FIRM of O'Keefe, Glennon & Co, sanitary plumbers and steam fitters, Appleton, Wis., have contracts for steam heating the Brothers' Hotel, at Kaukauna, and plumbing Peter Filler's Block, same place; also in a number of residences.

Bids for heating and plumbing the new County Alms House, at Rome, N. Y., will be received by the Building Committee until 1 o'clock Monday, August 20, 1894. Plans and specifications may be examined at the office of the architect, Jacob Agne, Jr., Arcade Building, Utica, N. Y.

New Heating and Ventilating apparatus is to be put into the Silver Street School at Westfield, Mass.

The new Queen Anne residence, lately built by Dr. C. B. Warner, on the bluff overlooking Lake Champlain at Port Henry, N. Y, is to be heated by a No. 3 Stanoard steam boiler manufactured by Giblin & Co., Utica, N. Y. M. Hogan of Port Henry is erecting the apparatus

MICHAEL J. DILLON has taken the contract to remodel the plumbing in William Hager's residence on Church street, Doylestown, Pa.

THE BOARD OF PUBLIC WORKS, Buffalo, N. Y., have contracted with Mensch Broa. for plumbing work to be done at Engine House No. 9 and Hook and Ladder House No. 1, located on the northest corner of Washington and Tupper streets, at their bid of \$797; also for work to be done at Engine House No. 21 and Hook and Ladder House No. 6, on Best street, near Jefferson street, at their bid of \$597.

- C. O. SAWYER & Co., Searsport, Maine, have secured the plumbing for the hotel and will be assisted by Mitchell & Dunbar of Belfast.
- L Moddocka. Boothbay, Maine, has begun the plumbing work in the new hall building there.

THE CONTRACT for heating apparatus for the public building at Lowell, Mass., has been awarded to Farrell & Conaton of Lowell at \$6800.

THE CONTRACT for putting in heating apparatus and plumbing the City Hall and Police Headquarters at Rutland, Vt., has been given to Tracy & Moran.

THE CONTRACT for the plumbing and water closets in the Centennial School, at Evansville, Ind., has been awarded to George S. Vaughn.

E. MEIELEM, Meriden, Conn., has the plumbing contract for two cottages for M. S. Rourke.

THE CONTRACT for plumbing, heating and ventilating the new school of

St. Joseph's parish, at Pawtucket, R. I., has been given to the Pawtucket Steam & Gas Pipe Company.

Thos Oakes has the plumbing contract and Ball & Lamb the heating contract for the new residence of Dr. C. C. Beach, Hartford, Conn.

JAMES RONALD is erecting a \$6000 residence at llartford, Conn., for which Olds & Whipple have the contract for plumbing and heating.

THE COWLES-COUCH COMPANY have the plumbing contract for Dr. H. C. Bullock's new residence at Hartford, Conn., also for four cottages being built by I. Bragaw.

E. N. SIPPERLY of Westport, Coun., has taken the contract to drive an artesian well for Dr. Danham of Greenfield Hill. Mr Sipperly has just completed a large windmill for E B. Sturges at Green's Farms, besides doing all the plumbing, piping. &c. The tower is of galvanized steel 50 feet high, with a 2200-gallon tank.

STAMFORD, CONN., is to have a new High School building 70 x 140 The building will have a slate roof, copper gutter and a system of heating and ventilation.

IN JOHN JACKSON'S new two family house at Waterbury, Conn., the Barlow Bres Company will do the plumbing, and it will be heated by two Spence hoilers by M. J. Daly of the Waterbury Steam and Gas Pipe Works.

LEE BROTHERS, Concord, N. H., are heating Gov. Smith's Block, Concord, and Dartmouth College, Hauover, N. H., using a carload of Exeter ornamental radiators in each.

The store in the Hoadley Building, 47 Church atreet, New Haven, Conn., is being fitted up in a most elaborate munner for a café, by J. Casariego. A tile floor is being laid, a metal ceiling put on and the interior will be hand somely fitted up with hard woods and mirrors. The place will be brilliantly lighted by combination gas and electric fixtures, the one in the center having 150 lights. In the basement a lavatory is being fitted up in marble, with Mott's fluest fixtures and a tile floor. Kelly & Coady, the new firm of plumbers, have charge of this work. George Pettit, Jr., of 307 Grand avenue, Brooklyn, is putting up the metal ceiling.

WM WILLIAMS, Oak Park, Ill., will install a steam heating plant in Dunlpos' Block. The United States Radiator Company's goods will be used.

The School Board of Newark, N. J., are to get bids from Newark firms for steam heating the new school houses in the Seveuth and Eighth Wards.

Daniel J. Rock, 86 North Clark atreet, Chicago, has the plumbing, gas fitting and sewerage in the residence of Mr. Peterson, Marianna street, near Lincoln avenue.

KEHM Bros. & MERTZ, 289 East Kilz e street, Chicago, are to supply a hot water heating and ventilating plant for the Lyons township high school, at LaGrange, Ill.

CHAS. H. GRAVES, 62 North Clark atreet, Chicago, is to install ateam heat ing plants in the flat building of M. J-Teehan, 269 Superior street, and in the residence of James McGiveran, Austin, 111

THE S. H. BEARD HEATING AND PLUMBING COMPANY, New Britain, Conn., have taken the contract for heat-

ing by steam the Samlow Block on Arch street. The company will also furnish and put up the steam heating apparatus for the Hotel Columbia, and will put in a hot water heater in the Allen Homestead at Pequabuck, Conn; also the plumbing for the Hotel Columbia and Samlow Block.

THE ANSHUTZ-BRADBERRY COMPANY, Pittsburgh, Pa, have a number of contracts on hand at the present time for the Tremont hot air furnaces. Among the buildings in which they will be placed are the following: Allegheny, Pi, Eleventh Ward School and residence of Henry Frey; Pittsburgh, residence of George T. Marshall, John W. Grove and twelve houses for Edward Powell; Buckhannen, W. Va., residence of John Crislip and store of Whitescarver & Brake; Cameron, W. Va., residence, Presbyterian Church and Parsonage; also residences in Fayette City, Champaign, Ill., Tarentun, Pa. and Ravena, Ohio.

The Walcott Hurlbut Company, 175-177 Lake street, Chicago, have received orders during the past week for 110 sections of the Siphon Eduction closet range.

EDWARD ARMS, Bellows Falls, Vt., has nearly completed the foundations for a block of houses on Westminster street.

At the special town meeting held at Barre, Mass., an appropriation of \$1950 was voted for heating and ventilating School House No. 1. The committee is composed of T. P. Root, C. F. Atwood, G. M. Harwood, B. F. Brooks and G. E. Allen.

THE PLUMBING AND GAS FITTING CONTRACT for the new residence of City Physician Hancock was awarded to the Platt Brooks Plumbing Company, Little Rock, Ark.

THE CLERK of the School Board of Springfield, Ohio, has been ordered to advertise for bids for a heating plant for the Clifton Street School.

ARCHITECT ZEITNER'S residence at Tyler, Ill., is to be warmed by a Hub heater furnished by the Smith & Anthony Company, 219 Lake street, Chicago.

THE CONTRACT for heating and ventilating University Hall, Madison, Wis., has been let by the Board of Regents to the Bayley Heating Company of Milwaukee, and the contract for heating and ventilating the North Hall has been awarded to King & Walker, Madison.

The absorption by the United States Cordage Company of the big plant of the Pearson Cordage Company has been successfully accomplished. The latter has hitherto been the chief competitor of the Cordage Trust, and its acquisition is regarded as a triumph to the latter. The purchase price of the plant is said to be \$1,000,000. The United States Cordage Company-the successors of the National Cordage Company, who went into liquidatiou a year ago-completed the adjustment of their affairs last week. Frank K. Sturgis was elected president of the corporation; and the following Executive Committee was chosen: F. K. Sturgis, W. W. Sherman, Francia Smith, E. F. C. Young, Rudolph Keppler and John I. Waterbury. The other officers of the company are: Vice-president, W. H. Corbin; secretary and treasurer, W. C. Lane; Finance Committee, G. G. Williams, F. K. Sturgia and G. H. Gossler.

# STEAM AND HOT WATER.

The Ornate Radiator.

The accompanying illustration shows the Ornate radiator made by the United States Radiator Company, Saltsburg, Pa., and for which the J. L. Mott Iron Works, New York, have the Eastern agency. As will be seen by the picture, the radiator has two loops, joined as usual at the top and bottom, and a novel effect in the design is gained by their being connected at two intermediate points. The connection of the loops at the middle is used for central decora-tive panel and the loop is thus divided into an upper and lower part, each side of which is decorated differently-pond lilies, wild roses, dogwood blessoms and cattails being used for orramentation. In connecting the loops it is possib'e to alternate the decorations or to so arrange them that viewed from either end the same ornamentation shows. They are capable of being very hand-somely finished in colors. In construcsomely finished in colors. tion the sections are joined by male and female nipple and socket, so made by epecial machinery as to fit absolutely tight without the aid of packing, and are securely held together by means of long heavy bolts which are hidden. The radiator is made for both steam and hot water in four different hights—23, 32, 38 and 45 inches, exposing respectively 2\frac{3}{4}, 4, 4\frac{1}{2}\$ and 5\frac{1}{2}\$ square feet of surface. Each section is 8 inches wide auriace. Each section is o inches wide and 2½ inches thick, the width of legs being 8½ inches, with hight from the floor to the center of opening of 5 inches. In ordering it is necessary to state whether the radiators are for use with hot water or steam, and if for steam, for a one or two pipe system. An advantage claimed for the Ornate hot water radiator is that the accumulation of air at the top does not stop the circulation through it unless the water rises only to a point below where the lower panels connect, which would be a very uncommon occurrence.

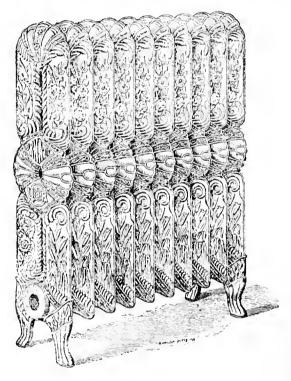

# Hot Water Plant Heated by Steam.

From Lucania, Scranton, Pa.—We write to in quire if there is any successful way or system of heating buildings with hot water, using attam from mains in the street for warming the water? We have heard of such a system. If there is any such plant in successful operation kindly let us know where it is, and if not asking too much, please give some explanation.

Note.—We shall be glad to hear from any of our readers who know of such heating plants. In The Metal Worker of December 15, 1888, we reprinted from The Stevens Indicator a description of a plant employed by the late Edwin A. Stevens for heating his residence at Castle Point, Hoboken, N J., and we briefly quote from the account mentloned. The plant was installed in 1858, and consisted of a two-flue boller, 42 inches in diameter and 20 feet long, placed 180 feet from the house, and at

a depression of 25 feet below the basement of the structure. Steam at 30-pounds pressure was conducted from the boiler house in a 3-inch galvanized iron pipe to the basement of the building, where 14 branches were taken to different points. Each branch was connected with a cylindrical cast iron drum, in which was a helical coil of \(\frac{4}{4}\)-inch iron pipe, a little less in diameter than the drum through which the steam circulated, and then returned to the boiler by gravity. Two inch air tubes ran through the drum from top to bottom,

The coal consumption averaged about half a ton per 24 hours during the cold season. This system has been repaired on two different occasions, the mains running from the steam boiler to the house rusting out and the main now consisting of 3 inch cast iron pipe, laid in lengths of 4 feet with flange connections, and especially designed for strength and to resist the abresive action of the pipe sliding on their flanges during expansion and contraction. Resistance to corrosive influences, which formerly destroyed wrought from pipe,

The Ornate Radiator.

furnishing warm air to the flues which | led to the rooms heated. The drum was partly filled with water, and the steam pipe leading to the coil within the drum branched above its top, so that a portion of the steam would mix with the water in the drum, and the condensation and expanded water overflow into the steam pipe and return to the boiler. Eight of these drums measured 371 inches, and six 26 inches in diameter, all being 48 inches high, aggregating 825 of the 2-inch tubes, exposing 1700 square feet of air heating surface, and 550 feet of steam coil, exposing about 125 square feet of water surface. The heating surface was proportioned on the basis of 19 square feet per 1000 cubic feet of space for the halla and first floor, and 13 feet per 1000 cubic feet for the remainder, the total area heated being 125,000 cubic feet.

caused the aubatitution of cast Iron mains.

In an apartment building at Hartford, Conn., 120 x 125 feet, with annex measuring 80 x 80 feet, five stories high, an auxiliary heater to a hot water plant was installed by the Blackmore Heating Company of New York. This was arranged to utilize the exhaust and also the live steam from the elevator hoisting apparatus. A special heater was designed for this purpose, consisting of an iron cylinder 42 inches in diameter and 12 feet long and provided with diaphragms 1 foot from each ead which received the ends of 144 13-inch brass tubes 10 feet long, having a total heating area of 1173 equare feet. The flow main is connected with the top of one of the end chambers of the cylinder and the return main taps the bottom of the other end chamber, com-

munication being established by means of the 144 brass pipes, the surfaces of which are heated by steam, inlet and outlet connections being provided for the same. An intercepting pressure regulating valve is provided on the connection between the boiler and the inlet, so that when live steam is used the pressure can be reduced to correapond with that of the exhaust ateam. This apparatus is capable of heating the building in mild weather, but three No. 32 Perfect hot water heaters are con nected with the flow main, which is 8 inches in diameter, for use in cold weather. There are over 600,000 cubic feet of space in the building, heated with 9355 square feet of direct radiating and 2445 square feet of indirect radiating surface. In view of the fact that the main heating plant consists of hot water boilers the piping was done in the usual manner, and the auxiliary plant being operated by steam required no special piping for successful results.

#### HEATING NOTES.

THE GURNEY HEATER COMPANY, Boston, are issuing a new sign for distribution among the trade. The sign is embellished with a silver bas relief on a black background of their Gurney hot water heater at one side, while their steam heater is shown in the same style at the other side. Their address in silver letters is also given, and at the bottom of the sign is the inscription, "The Standard for Excellence."

THE EXETER MACHINE WORKS, 32 Oliver street, Boston, display in their showrooms a handsome selection of steam and hot water radiators, as well as heating apparatus. The foundry of this company is at Exeter, N. H., and has been steadily running turning out these goods.

THE ARCHAMBO, MARTIN & MORSE COMPANY of Minneapolis have filed amended articles of incorporation, changing the name to the "Archambo & Martin Company," and the general nature of its business to the manufacture of heating and ventilating apparatus.

D'Estes & Seeley Company, 29-33 Haverhill atreet, Bostor, manufacture the Cuttis engineering specialties. These include the Curtis ateam trap for return condensation to a drip tank, under a pressure of 200 pounds or with a vacuum; the Curtis return trap, by means of which the condensation is re turned to a boiler carrying a pressure of 120 pounds without the use of pumps; the Curtis pressure regulator, permit ting the use of various pressures at different parts of a plant from a high pressure boiler, and the Curtis damper regulator, adapted for regulating the fire to meet the requirements of the case. In addition, they carry a full line of pipe fittings and brass work needed by the pipe fitter.

THE SPERL HEATER COMPANY, Carbondale, Pa., successors to the Susquehanna Steam Heater & Mfg. Company of Susquehanna, Pa., have broken ground at Carbondale for the erection of a brick machine shop with boiler house annex. The company are organized with a capital stock of \$30,000 to manufacture the Spell patent hot water heater. C. E. Rettew, master mechanic

of the D. & H. Canal Company, is president of the company; A. D. Harding, secretary; A. P. Trautwein, tressurer, and Thomas McDonald, manager.

The American Radiator Company, 44 Oliver street, Boston, have arranged on their sample floor a varied and handsome line of radiators from which the dealer has no difficulty in making a pleasing selection for his customers. E. R. Pierce, the manager, has been taking a vacation at Belfast, Maine.

A 32-PAGE CATALOGUE of the Sunray steam and water heater is being sent to the trade by the J. L Mott Iron Works, New York and Chicago. Some explanation is given of the process of combustion and the efficiency of different kinds of heating surface, followed by a statement that the Sunray boilers are constructed to secure the greatest benefit from the heat generated by the fuel. The first cuts show the new vertical section Sunray steam and hot water boiler, followed by the "40 Series" Sunray, the horizontal section Sunray, with tables giving prices, dimensions and ratings. Other cuts show the smaller apparatus connected with large kitchen boilers which the house furnish, and a line of steam and hot water radiator valves, automatic air valves, altitude gauges, thermometers, pipe hangers and expansion tanks. The last page of the cover states that radiators from all the standard manufacturers can be furrished.

W. F. GILLING, formerly manager for Le Bosquet Brothers, Boston, has become associated with the New York office of the American Boiler Company, 94 Centre street, and will travel in their interests in the New England States, where he is well and favorably known both for his knowledge of heating and for his good fellowship.

THE CATALOGUE distributed by the Standard Radiator Company, Buffalo, N. Y., for the current year, is gotten up in an exceptionally neat and attraction forbion. He is a superior forbion of the superior forbion of the superior forbion. tractive fashion. It is bound in flexible brown paper with "The Standard Radiators" printed in gold on a green Radiators" printed in gold on a green background. The radiators themselves are illustrated by means of half-tone engravings printed in brown and show very clearly the artistic excellencies of these constructions. The first one shown is a three column radiator; then a two column; then a four column; then a three column; then loops of the different radiators; next, the New Standard direct and indirect. All these radiators are briefly described and full tables of sizes, dimension, &c., given. At the end the Standard indirect radiators are illustrated and descriptiona given. The final page is headed Nota Bene and gives the particulars to be observed when ordering goods.

B. D. DUGGAN will represent the Richmond line of steam, hot water and warm air heaters, and conduct a general contracting and heating business at 207 209 Lake street, Chicago.

#### OBITUARY.

A. BURTON PAXSON.

The firm of J. W. Paxson & Co. of Philadelphia, dealers in foundry supplies, have austained a loss in the death on July 31 of A. Burton Paxson, a member of the firm. Mr. Paxson was ill about nine weeks with typhoid fever. He was a bright young man and highly esteemed in his circle of acquaintances and by the trade throughout the country.

#### SCRAP.

RICHARDS & Co., 60 Union street and 47 Friend street, Boston, are importers and dealers in all grades of tin plate and sheet iron. They also carry a large stock of sheet copper, plain planished and tinned in various weights and thicknesses.

THE NEW CASTLE STEEL & TIN PLATE COMPANY, New Castle, Pa., recently added to their equipment two 18-foot boilers, 84 inches in diameter, and are now running six mills full.

It is stated that a tin plate company have agreed to locate in New Lisbon, Ohio, if the citizens at that place will secure to the concern a tract of land at a reasonable price, and then buy from them 300 lots at \$200 each. Four buildings are proposed, and 200 men are to be employed. Charles M. Bray, secretary and mechanical engineer of the Llovd Booth Company of Youngstown, Ohio, is representing the projectors in the preliminary negotiations. Others interested in the new venture are W. T. Graham, B. M. Caldwell and J. J. Holloway of the Ætna-Standard Iron & Steel Company, Bridgeport, Ohio.

WALLACE, BANFIELD & Co., LIM-ITED, operating the Ironda'e Rolling Mills, at Irondale, Ohio, manufacturera of tin and terne plate, are making some extensive improvements at their plant, which are expected to increase the present capacity about one-fourth. present equipment is being increased by the addition of one Mesta patent pickling machine, to be furnished by the Leechburg Foundry & Machine Company, Pittsburgh, and three new heating furnaces are also under ercc-tion. The old original sheet mill is being torn down and is being replaced by a frame structure covered with corlugated iron, which will be made as nearly fire proof as possible. The large engine is being repaired and a new cylinder will be added, 36 x 60 inches in size. A new fly wheel will also be put in, which will weigh about 60 tons. The pickling machines are being re-paired and other minor improvements are under way.

WE are officially advised that The Johnson Company, Johnstown, Pa., are not identified with the project of establishing a plant at Lorain, Ohio, for the manufacture of tin and terne plate.

An 8000-ton forging press is now in use at the River Don Works of Vickers, Son & Co., Sheffield, England. The shareholders, at the close of a recent meeting, were invited to inspect the working of this machine, and it is stated an ingot weighing 66 tons was taken from the furnace and conveyed to the press, under which it was swiftly and silently squeezed to the required proportions. When finished it will be 18 inches thick, and is ultimately to form one of the plates of the Russian war ship "Three Saints."

It is stated that some trials have recently been made in the Liege district in Belgium, with the "trueing up" in position of the rolls of sheet rolling trains which have become hollowed in the middle owing to constant use. Emery wheels have, it is said, been used for the purpose, the results having been successful.

# THE TIN SHOP.

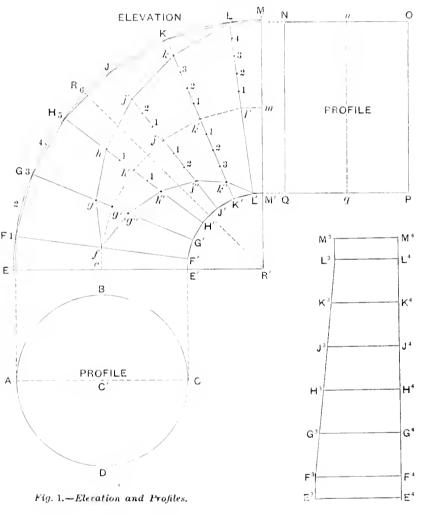

Rectangular.

From R. B., Philadelphia, Pa.— Please describe in The Metal Worker the development of a right angled elbow, rectangular at one end and round at the other, the change to be gradually developed in an elbow of seven sections. I will leave you to choose radius, proportions, &c.

Answer.—In Fig. 1 let A B C D represent the profile of round end and N

Pattern for Elbow, Round to | in the present instance five. From k' set off each way four spaces, as shown by k k' and k' k''. Set off from j' three spaces, as shown by jj' and j'j''. Continue this operation and connect the points f(k)  $\hat{h}$  g f, g'' h'' j'' k'' L', thus showing in side elevation the change from the rectangle N O P Q to the circle A B C D. To show a similar shape on the outer curve of elbow, draw any line, as E1 M1, in Fig. 2.

obtained creet perpendiculars, as shown. From E4 F4 set off the distance C' B of profile of circle, and draw E<sup>3</sup> F<sup>3</sup>. From M4 L4 set off the distance N n of profile of rectangle and draw M3 L3. Connect L<sup>3</sup> F<sup>3</sup>, thus completing the figure. The shapes on inner curve of elbow, as shown in Fig. 4, are obtained in the same manner as described for Fig. 2. The method for obtaining the patterns for sections E F F' E' and L M M' L' are the same as

М  $M^2$ ı ĸ J G<sup>1</sup> G<sup>2</sup> F  $E^{1}$ 

Fig. 2 -Shape on Outer Curve.

Fig. 3. - Hight on e m.

PATTERN FOR ELBOW FROM ROUND TO RECTANGLE.

O P Q the profile of rectangular end of the elbow. To obtain the miter lines the eighth circle E R has been divided into six parts and one of these parts set off from E, and a line drawn to R' gives the miter line for the first section. Two of the divisions are set off from F, as F G, and G R drawn, &c. Through the center of the elevation draw the lines c to m, and divide L l' into the number of parts there are pieces in the elbow subjected to the change in shape, From E1 set off the spaces E F, F G, to L M. As it is only necessary to show the half shapes, from M1 and L1 crect perpendiculars, in length equal to N n, of profile and connect same, as shown by M2 L2. Connect L2 F1, and from the points in E1 M1 creet perpendiculars cutting F1 L2.

For the hights of sections on c m of elevation, on any line, as E4 M4, in Fig. 3, starting from E4, set off the distances cfg'h', &c., and from the points thus

for an ordinary pieced clbow. method for obtaining the pattern for one of the remaining sections will beshown, which will indicate the method to be followed in the other sections. Then we will obtain the pattern for sectlon F G G' F'.

In Fig. 5, F G G' F' is a duplicate of section having similar letters in elevation. The shape F U F' in Fig. 5 is the half of an ellipse, which can be deacribed in any convenient manner. Uf of this figure is derived from C' B of profile, Fig. 1. From G erect the perpendicular G S, equal to G1 G2 of Fig.

M

H

G

F:

Fig. 4.-Shape on Inner

Curve.

F U F' into any convenient number of parts, and from the points thus obtained drop perpendiculars cutting G G' 2, and from G'erect another perpen- and F F'. Connect these points, as

> S IJ

Fig. 5.-Shapes an Miter Lines.

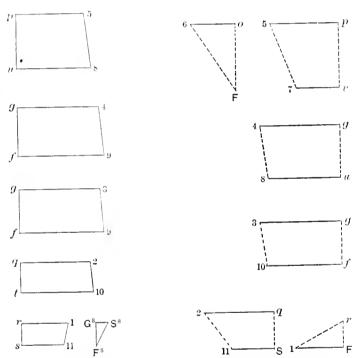

Fig. 7.—Sections Represented by Dotted Fig. 6 .- Sections Represented by Lines in Fig. 5. Solid Lines in Fig. 5.

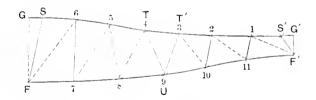

Fig. 8 .- The Half Pattern.

PATTERN FOR ELBOW FROM ROUND TO RECTANGLE.

points g and g' erect perpendiculars equal to G3 G4 of Fig. 3, and connect TT', as shown. Connect S T and T' S' by part of an ellipse corresponding with F U F'. Divide S T, T' S' and

dicular, equal to G5 G6 of Fig. 4. From | shown by the solid and dotted lines in G G' F' F. If the dlagram shown in Fig. 5 was cut out of cardboard, and G T T' G' were bent up at right angles on the line G'G; FUF bent in a similar manner on F F', the distance | surcharge of the rate of exchange.

between points in G T T G and F U F would be the same as if measured between similar points on the finished article. As this operation would not be convenient in practice, a similar result can be obtained by the use of sections. These sections are shown in Figs. 6 and 7. To construct the sections represented by solid lines in Fig. 6, proceed as follows: Draw the line F7 G7, in length equal to F G of Fig. 5, and from point G' erect a perpendicular, in length equal to G S of Fig. 5. Connect F' S', which gives the distance between points F and S. For the second section craw ro, in length equal to vo of Fig. 5, and make the perpendiculars o 6 and v 7 of section equal to lines having similar letters in Fig. 5. The other acctions are obtained in a aimilar manner. To construct the sections represented by dotted lines in Fig. 5, proceed as follows: Draw the line Fo of Fig. 7, in length equal to F o of Fig. 5, and from o erect the perpendicular o 6, equal to o 6 of Fig. 5, and connect F 6. For the second section draw v p, in length equal to v p of Fig. 5, and from points v and p erect perpendiculars equal to r 7 and p 5 of Fig. 5. Connect points 7 5, which give the distance between corresponding points in Fig. 5.

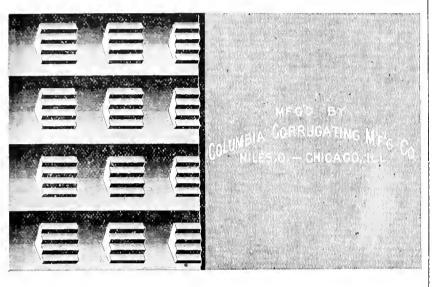

In Fig. 8, G G' F' F is the pattern of part of article shown by similar letters in Fig. 5. The distances represented by solid lines in pattern, as indicated by corresponding figures, are obtained from the sections in Fig. 6, and the diatances represented by dotted lines in pattern are obtained from the sections in Fig. 7. The stretchout of GSTT'S' G' of pattern, is obtained from G S T T'S' of Fig. 5, as the stretchout of F U F' of pattern is obtained from F U F' of Fig. 5. Then for the pattern shown in Fig. 8 proceed as follows: Draw G F of pattern, in length equal to G F of Fig. 5 or F7 G7 of Fig. 6. From G of pattern erect the perpendicular G S, equal to G S of Fig. 5 or G7 S7 of Fig. 6, and connect F S of pattern. From S of pattern as center, with 8 6 of Fig. 5 as radius, describe an arc, 6, which intersect with one struck from F of pattern as center, with radius F 6 of Fig. 7, thus establishing point 6 of pattern. Then with radius F 7 of Fig. 5, from F of pattern as center, describe an arc, which intersect with a second arc struck from point 6 of pattern as center and F 7 of Fig. 5 as radius, thus establishing point 7 of pattern. Continue this process until the various points indicated ln pattern are located. Lines drawn through the points thus obtained, as indicated by G S T T' S' G' F' U F, will be one half of the required pattern. The other half can be obtained by duplication or by a repetition of the above process.

The Chilian Council of State has decreed that after December next customs duca are to be paid 25 per cent. in gold and the remainder in paper, plus the

# ROOFING AND CORNICE.

The Columbia Steel Lath.

The secompanying illustrations show the appearance of the Columbia patent fire proof steel lath, manufactured by the Columbia Corrugating Mfg. Company, Niles, Trumbull County, Ohio. Fig. 1 is a section of the lath, part of E. B. Badger & Sons, 63 High street, Beston, Mass., are one of the old coppersmith and sheet metal working houses of Boston. They manufacture copper boilers of a high grade, adapted for plumbers' use, jacketed kettles, coils and a general line of copper work. In addition to this they do a large busiin a depressed and neglected condition, is said to have revived considerably of late under the British rule. The number of active mlnes and of miners is rapidly increasing. The mines form a portlon of the great stanniferous belt which stretches along the granitic backbone of the Malay Peninsula.

The Columbia Steel Lath .- Fig. 1.-Lath Partially Flastered.

which is plastered, while Fig. 2 is the back of the lath, showing the way the plaster keys through the slot. The lath is made 27 inches wide by 48 inches long, containing 1 square yard, and is thus easily handled by one man. It is a steel sheet crimped, cut and pressed in form at one operation. The shallow V-shaped corrugations are 1½ inches wide, and the locks for the mortar are punched up at intervals of ¾ inch apart and are ¾ inch wide. The small crimps on these locks take up the surplus metal on them, and at the same time they greatly stiffen the sheet. The laths are put on the building across beams and joists. This lath can also be used on cornices, columns or wherever a curved surface is needed.

#### FLASHINGS.

Chas. W. Carll of the Trenton Architectural Cornice Works sends us a notice of the removal of the works to the southwest corner of Warren and Front streets, Trenton, N. J.; the building has been enlarged on account of the demands for building sheet metal work which has been increasing with them. The house also do a large business in hot air furnace work and tinning.

J. M. ROBINSON & Co., Cincinnati, Ohio, have just closed contract with the newly organized company, the Youngtown Iron & Steel Roofing Company, to supply them with an entire outfit of roofing machinery covering, corrugating and crimping machines, presses, dies, cornice brake bending machines, &c.

ness in architectural copper and galvanized iron work.

THE BOURLIER CORNICE & ROOFING COMPANY were incorporated July 30, at Louisville, Ky., with a capital of \$5000 for the manufacture of galvanized iron

The Indiana Natural Gas Supply.—The annual report of State Gas Inspector Jordan, made public on the 1st inst., contains much that is interesting. The amount of capital invested in the State, due to the discovery of gas, he says, is \$300,000,000, and the influx of investment still continues. The gas has been drawn upon so heavily that there is now little more productive territory to be had. He says that already the limit of supply has been reached, and that the initial rock pressure has fallen from 350 pounds to 240 pounds. Many wells have been abandoned and the end is only a question of time. The report points out that during the, first four years of consumption the waste of gas was equivalent to \$20,000,000. The waste still continues in the domestic use, which ought to be dispensed to the consumers in meters instead of through mixers. Cheap piping and cheap connections have already caused heavy waste.

The republic of Paraguay is desirous of concluding a treaty with the United States similar to the treaty now existing between Brazil and this country.

R. D. Servoss, 21 and 23 Centre street, New York, has published a sec

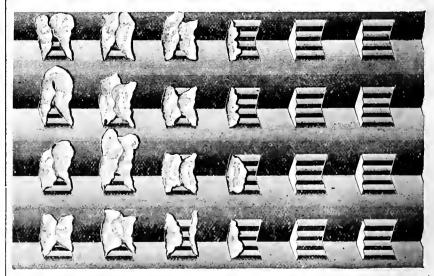

Fig. 2.—Back of Lath.

and copper cornices, skylights, &c. The incorporators are Emtle and Alphonse Bourlier, Charles Hansley and Rudolph G. Dorn.

The tin mining industry of Mergul, Lower Burma, which has been for years tional road map of Kings and Queena Counties, N. Y., giving the good roads. The work is in pocket size, and while more particularly intended for cyclists, the detail and care used in its compilation recommend it to the general public as well. A key map admits of ready reference.

Progress in Galvanizing.

To correct any misapprehension that may arise from an article published in The Metal Worker of August 4, we print below a letter received from the McDaniel & Harvey Company, Philadelphis, through their president, II. Whiteley:

In The Metal Worker of August 4, in the article headed "Progress in Gal-vanizing," descriptive and laudatory of the Baylisa apparatus, we notice the following: "One of these machines is now being placed in the works of the oldest galvanizing concern in this country." As our concern is universally acknowledged the oldest galvanizers of sheet iron in this country, having begun in 1852, there can be no doubt but that we are the concern referred to. When the article was written it was doubtless true that one of these machines was being placed in our works. We gave the machine a trial and rejected it for inefficiency and non-fulfillment of the claims made for We would never have made any public announcement of this fact were it not for the unmistakable but entirely unsuthorized public reference to ourselves in that article, and the attempt thereby to make capital for the machine out of our apparent indorsement and to use us as an advertisement. This compels us to publish the results in order to relieve ourselves of all complicity in that statement, and that no one may be led to purchase the machine under the belief that we are using it. The facts are that we made a trial of one of these machines which Mr. Bayliss erected in our works on approval. We found its performance fell short of the guarantee in speed, output, quality and appearance. We notified Mr. Bayliss to that effect and took out the machinery, which we now are holding here subject to his order and awaiting shipping into his order and awaiting shipping instructions.

The "Architects' Directory for 1894" has just appeared from the press of Wm. T. Comstock, New York. It is put up in convenient shape and bound in red boards with gilt stamp. The work bears marks of careful preparation and sims to glve, classified by States and towns, all the architects in practice in the United States and Csnsda. In giving architects' names the membership in the architectural societies is indicated by figures in brackets following each name. A selected list of the principal dealers in building materials and appliances is also given, which will be found useful to architects. To manufacturers and dealers the list of architects will be found of great value in addressing circulars and sending samples. The work is well got up, clearly printed and of convenient size, and will be of value to architects and the building trades. The price is \$1.

In the sinking of the powerful barbette battle ship, "Chen-Yuen," and the capture of the steel cruisers "Chin-Yuen" and "Ching-Yuen," by the Japanese, the Chinese have lost the flower of their navy and cannot now hope to cope with the Japanese at sea. The details of the naval battle between the two fleets, when received, should throw some interesting light on the capabilities of the modern ironclad in war

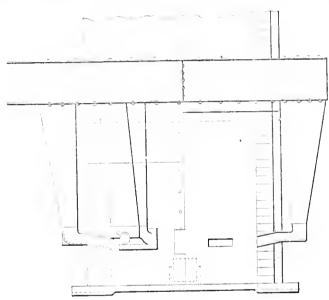

An Economical Cupola.\*

BY F. B. WHITCOMB.

At the May meeting of the Western Foundrymen's Association a letter from the writer was read in which was given a short description of the workings of a cupola erected under my directions, at Beloit, Wis., for the Eclipse Wind Engine Company. The cupola was Engine Company. The cupola was built in 1885, and when first lined was bricked up to 40 inches, but as the heats increased in size the brick was carried up to 45 inches. For blast a No. 6 Sturtevant fan was used, placed about 12 feet from the cupola. The air pipe 12 feet from the cupola. ran straight through to the air chamber around the cupola, and was considerably larger than the outlet of the fan. The air chamber was several feet above the tuyeres, and the pipes running from the air chamber to the tuyeres were 11 x 10 inches at the first point, and graduated down to 5 x 10 inches at the tuyeres. The tuyeres were four in tuyeres. The tuyeres were four in number,  $2\frac{1}{3} \times 9$  inches, the longest way horizontal. The tuyere on the right

than are used generally. They will let the air escape freely, and show less pressure on an indicator than a cupola with less tuyere surface that would confine the air more. Light coke does not require as much blast as heavy coke. I have used but two kinds of American coke that I could rely upon: Connellsville and New River. Connellsville is heavier than New River and will stand more blast. I used Enlish coke one year in San Francisco, and found it to be a good deal like New River, and an excellent fuel.

My 4-ton heats usually took 40 minutes to melt from the time the blast went on until the bottom was dropped. The larger heats ran about 7½ tons an hour. The iron would commence to melt in about six or seven minutes after the blast went on. For the bed, I filled to 23 or 24 inches above the tuyeres with coke, then put on 2500 pounds of iron. The balance of the charge was from at to seven shovels of coke to about 1200 pounds of iron. The cupols was fired about 1½ hours before the blast went on. In heating, when the fire was

THE WHITCOMB CUPOLA.

hand and in front was placed 13 inches above the bottom of the cupola, and the other three 131 inches above, so that the man that tapped out could watch the lower tuyere should at any time the iron be near it. In running through the lining the tuyeres were inclined a little toward the bottom. The cupols was 10 feet 6 inches long from the bottom to the bottom of charging door, and the slag was about 11 inches below the tuyeres. I superintended this foundry for four years and a half, and ran the cupola for a little over three years of this time. The heats varied from 4 to 16 tons, and during one year of the time I was in charge the average melting for the year was 115 pounds of iron to 1 pound of coke. The best melting for a single heat in that time was 14 to 1. The work done was in wind mill castings, pulleys and engine castings—from light snap work to castings weighing more than 5 tons. There was no indicator attached to tell the blast used.

I do not think we can use the same amount of blast pressure on all cupolss. Take, for instance, the cupola described above, with air pipe and tuyeres larger

atarted, coke was put in to cover above the tuyeres, and when that was fired through the balance of the bed was put in and charged until the cupola was full. In charging, I am always very particular to get the coke as even as possible. If there is any difference, I favor the sides instead of the center with the most coke. I am satisfied that in many foundries more coke is used than is necessary. Where too much coke is used, iron will not melt as fast, and to melt iron with little coke, it must be done quickly. Use enough to make the iron hot, and after that is done every pound added does more harm than good.

In conclusion I will state that the best feature of this cupola was in the free way it received the blast. From the experience I have had and were I to put up another, I would make a change in the tuyeres, making them 2 x 12 inches instead of 2½ x 9 inches, to give more space around the aide for the air to enter and be distributed inside more equally. For larger cupolas than the one I have described I would use aix tuyeres instead of four. It is better, also, to have a little more blast than is necessary than not to have enough; for it is always easy to shut off some while it is hard to increase it.

<sup>\*</sup>Read at the monthly meeting of the Western Foundrymen's Association, held in Chicago, July 25, 1894.

# STOVE TRADE NOTES.

Philadelphia Stove Trade.

There is very little change noticeable in the condition of trade in this market. Orders from salesmen are coming in very slowly and are very small in size. It frequently happens that a salesman will visit several towns without securing an order. It cannot be said, however, that the outlook is bad. Buyers acknowledge the fact that their stocks are extremely small, but state that they will not place orders just at present. The probability is that the majority of orders will be held until the end of the month or later. There is a noticeable disposition on the part of retailers to adhere as far as practicable to the hand-to-mouth principle of buying indulged in last year. Much dauger is foreseen in this plan by shrewder and older merchants, who, while perhaps holding off their orders for a few weeks longer than usual, will manage to secure a prominent position on the manufacturers' order book for their orders covering a full line of goods. The probability is that the months of September and October will be busy ones for the manufacturers, if the postponement of orders continues as at present, and a speedy settlement of the tariff bill would materially increase the activity. Meanwhile the production is very light, considerable shutting down being reported in July, and the stocks in the hands of manufact. urers are not nearly so large as usual. Ranges are in fair demand, and furnaces seem to be moving pretty well, but the volume of business is small in comparison with former years. Heating stoves seem to be out of the race just now, and form the major part of the postponed orders. A leading manufacturer here is this season introducing steel ranges, and is making a bid for dealers' patronage in this line with encouraging prospects of success. Trade with the South has been very active during the past few weeks, owing to the war in freight rates fought by the different The rates to carrying companies. Southern points have been ridiculously low, and buyers have not been slow to take advantage of them. It was expected that a new tariff of rates would come into effect on August 1, but at present the low rates are still in force. Collections show little, if any, improvement, but it is some satisfaction to find that they get no worse.

few days will bring forth, but that we are on the eve of a change for the better no one doubts, and the turning like the such as covers, centers, legs, &c., where two, four or six patterns would be required on the floor, one or two would do for the bench. There would recently, are trying to organize a co-It is impossible to surmise what a

point centers on the passing of a tariff bill of some kind, and thus ridding the situation of a great uncertainty.

#### Bench Molding in Stove Shops.

BY BENCH MOLDER.

Managers of stove shops are the last of all in the leading branches of the foundry business to discover the great utility and economy of bench molding. In discussing practice and methods with shopmates I find that few even of bench molders are aware that this method has any advantage over floor work. Floor molders believe that the only advantage the employer can derive from it is to get a piece made for less than it would cost on the floor. Foremen of stove shops are always floor molders, who as soon as promoted proceed to practice and enforce the views they had formed and the knowledge they possessed as floor men. This has two results: 1. It confirms the belief of the floormen that they were right, that benches are only good to enable employers to cut prices. 2. Bench employers to cut prices. 2. Bench molders who are good mechanics soon seek work elsewhere, leaving only the poorest hands to maintain the reputation of the craft in stove shops.

Under these conditions bench work and bench molders fall into disrepute, both in the office and in the shop. In other trades branches and subdivisions are distinguished by placing a man in charge who is well up in that particular line. Bench molders, however, are not recognized in this way, but are left to the supervision of the general foreman of the foundry, He is, as I have said, always a floor molder, and although he may be an excellent mechanic and a most capable foreman, he lacks the parfully competent to superintend the de-tails of banch work. No one but a tails of bench work. No one but a well trained bench molder is qualified to decide what work can be made best on the bench, best methods of "boarding" work and numberless other small questions of detail.

With no practical experience and no settled policy to guide him, the foreman disposes of these questions as they occur, in a haphazard way, sometimes on the advice of one bench molder, then of another, but more often according to his own notion. This is why it is so often noticed that good bench jobs are on the floor while jobs that would be good floor jobs but poor bench jobs are

on the bench.

Prices of molding out of the question, I claim that bench molding has at least five distinct advantages over floor work on jobs common to both. 1. To begin with the first cost of getting a job in sand, snap flasks and other bench equipment should not be reckoned in this as they are, like the cupols or the walls of the shop—permanent fixtures. On jobs that may be made on either bench or

be not only less to make but less to handle, to store and to care for. only other expense, after the patterns come from the fitters, is the follow board, and with rare exceptions this should be a "hard match" made by the molder. Drought and moisture, as well as extremes of temperature, sffect a wooden follow board, especially on intricate work, causing vexatious delays while the carpenter makes the necessary change, while a "bard match" properly made is practically indestructible and never affected by atmospheric conditions, no matter how extreme. T cost of a "hard match," 75 cents. Total a ten-a-day job the ratio would be about ten to one in favor of the bench, increasing with the number of flasks required.
2. The comparative ease with which

a force of bench men may be handled as against an equal force of floor men.

Snap 3. Durability of equipment. Snap flasks with ordinary care and a little repair will last a lifetime. They may have to be replaced by improved flasks sometime, but not because they are worn out. Most stove men know how long floor flasks last. They are exposed to atmospheric changes when not in use, even when kept under shelter, and to ill usage by the molders when in

4. The large amount of storage room required for floor flasks, owing to the big surplus necessarily kept on hand. The few surplus flasks and bottom boards for benches are always kept on the molders' floors, no storage room being required except for the matches, and these do not require as much room as follow boards for the floor.

5. The facility with which a change may be made from one job or lot of jobs to another. Every job on every bench floor in a shop might be changed any morning and another lot started and yet every man have his floor "up" at blast time. This would be best appreciated in busy times. If a man is off, owing to sickness or other cause, and his work falls behind, the foreman distributes his jobs around among the other men until he returns; thus the employer gets the work he wants, the other men suffer no inconvenience and the man returns to his work the way he left it. What a difference between this and the existing practice in floor

It is true, as very clearly shown in a late article, that efficiency in workmen is desirable and of positive advantage to themselves and their employers. Efficient methods are not a whit less advantageous nor less capable of producing profits, and it is my belief, founded on observation and experience during ten years' work as a stove molder, that in all shops where a thor-ough and systematic trial is given to bench molders and molding under the direct supervision of competent bench molders, the increased profits will prove it to be an efficient method.

IT IS REPORTED that the employees

operative company to operate the works. It is stated that 22 of the employees have agreed to take stock, and a number of others have expressed a willingness to take shares on 10 per cent. reduction from their wages.

### C. Emrich,

Columbus, Ohio, has just issued his 1894-95 eatalogue and price list of Florence stoves and rauges and Brilliant heaters. The volume contains 56 pages and is bound in paper covers, the first page of the cover bearing the trademark and address of the company. In an introductory note the statement is made that a number of new and modern ranges, cooks and heaters have been added to his line, combining elaborate ornamentation with the latest improvements and conveniences necessary for satisfactory operation and durability. The Ideal Florence is a handsome new range of the sheet flue type, for either coal or wood, the oven being 11 inches higher, it is said, thau is usual in this class of range. The castings are smooth and the flues extra large and accessible, provision for cleaning being made in both the front and side. It is also provided with end ash pit, hot water reservoir, high closet with revolving front and nickel plated oven panel with tile center. The Model Florence is a neat two-flue cook stove, adapted for burning any kind of coal or wood, and is made with incased or bracket reservoir and warming closet. The Queen and Royal Florence ranges are made both right and left hand, of the sheet flue construction, and are brought out to meet the demand for ranges of moderate cost. The Prize Florence is a new flat top cook stove with feed chute for soft coal and is made with bracket reservoir. These are followed by the New Florence, Fioral and the Magnolia coal cook, 13,000 of which are said to have been sold. The Brilliant surface burner base heater, a handsome square stove, is the leader of the heating line, followed by the Brilliant Franklin and the Brilliant Oak, which is the latest addition to the line of Brilliant heaters. These are followed by the Brilliant revertible flue and direct draft heater; the Open Firelight Royal, an oven parlor stove; the Olive, for coal and wood; the Report and Cora, cannon stoves; the Agate, round soft coal stove; Ironsides box stove and the Scout, two hole dining room stove.

### The Cortland Howe Ventilating Stove Company

of Cortland, N. Y., are issuing to the trade a 44 page catalogue, bound in pale blue covers, the trade-mark and address of the company appearing on the first page of the cover. The opening pages are devoted to an enumeration of the merits for which medals have been awarded their goods, terms and reasons why the Cortland Howe ventilator should be purchased by all wishing economical heaters. This is followed by cuts of the stove showing its general appearance, its construction and operation being indicated by sectional illustrations. Various designs of the stove are shown, the No. 19 being a powerful heater designed for use in halls and large rooms. The goods next noted are the Cortland wood ventilator and the Cortland Gem, the latter being a full nickeled square stove and provided with a ventilating system differing somewhat from the Cortland Howe principle. The Be-at-us is a new

medium priced base burner with full | return flues and made always as double beater. The application of the Cortland Howe as a double heater is illustrated by means of an engraving. The different atyles of grates used are illustrated, with special reference to the ball bearing and spherical center features. The Franklin cottage and Golden Star cottage are handsome wood stoves of the return flue type; the Cortland oak, a new stove of handsome design and elegant proportions; the Cortland cottage, for hard and soft coal; the Golden Star, a round base burner with revertible flues, for hard coal; the Oak ventilator, arranged to take cold air from the floor and discharge it highly heated from the top of the stove, and designed to operate either as a circulator or double heater, are referred to in the order named. The next few pages give the sizes of the fire pots, heating capacities of the stoves and directions for ordering repairs. Accompanying the catalogue we find a number of differently colored aline bearing testimonical ently colored slips bearing testimonial letters of the superior operation of the stoves turned out by the company named.

## Cribben, Sexton & Co.,

Chicago, Ill., have just mailed to the trade their 1895-95 catalogue. volume is bound in dark green covers, a gilded globe bearing the inscription "Universal Stoves and Ranges," as well as the address of the company and the date being embossed on the first cover. Their various branches, foreign agencies and Chicago address are printed in gilt on the back cover. The opening pages are devoted to views of their works at Chicago and agencies at San works at Unicago and agencies at San Francisco, Portland, Orc., Denver, Min-neapolis, Los Angeles and Salt Lake City. The first of their goods noted is the Regal Universal range, a construc-tion of handsome design and referred to as possessing "all that modern science in stove production has brought forth for convenience, durability and effi-ciency." The Peerless Universal and the Modern Universal come next, embodying all the good features of the Regal Universal, but being of smaller size; then the Welcome Universal and Umpire Universal, which have established a reputation with the trade; the Superb Universal, for burning soft coal and wood and embodying all the modern features of convenience and utility; Novel Universal and City Universal, new four and six hole ranges, possessing much to recommend them to the dealer; the Apollo Universal and the The Planet Universal wrought steel range is referred to by the manufacturers as having been brought out to meet a well-defined demand and possessing all the features that go to make up a first-class construction. Following come the Pacific Universal, Majestic Universal and Victor Universal ranges. The Imperial Universal, Sterling Universal, Harvest, Hummer and Prize Universal are included in their line of flat top cooks for coal and wood, while their line of wood cooks is represented by the Prize Universal, Majestic Universal, Domestie Universal, Elegant Universal, Western, Columbia, Dandy and the Eclipse supplied with elevated The Universal Hotel cook, for coal and wood, is referred to as being of large capacity. The Radient Universal, a high grade aquare base burner of elab. orate design and handsomely nickel plated, is claimed to embody features differing from all constructions previ-

ously employed for heating. The Cheerful Universal. Royal Universal, Treasure and Hero come next. The goods next in order are the Jewel Universal, a hard coal surface burner of the return flue type. made with planished steel body: the Universal Oak, leading the line of Oak stoves: the Model Oak and the Live Oak. Wood heaters and cannon stoves are then referred to, and then come the Ideal Universal, a haudsome cottage parlor stove for wood only, the Universal Oak and a line of Todd and hox stoves. The close of the volume is devoted to farmers' boilers, sugar ketties, hollow ware, warming closets, high closets, &c., together with instructions for ordering repairs.

### Bergstrom Brothers & Co.,

Neenah, Wis., distribute a supplementary catalogue of Royal atoves, ranges, furnaces and hollow ware of their manufacture, in which is to be found a line of stoves which, in connection with those presented in their regular estalogue, they say make as complete a line of cooks, ranges and heaters as can be found. Beginning with the Casket range, for coal and wood, a handsome apparatus made in various styles and sizes, the volume presents the Emblem range, for coal or wood, likewise shown in various styles, and the Ensign range, similarly illustrated. Then come illustrations of the deflecting damper, the operation of which is carefully described. The Medal range, for wood, follows, with four illustrations; then the Axtell, for coal or wood, and the Minerva, for wood. The parlor aboves include the Elmhurst, New Elmhurst, Royal Oak, Park Oak, Tacoma, Cameo, Amber and Spark. The Emperor, for wood or soft coal, with drums, is likewlae illustrated, as well as the Prince, a cheap construction for wood. The eatalogue is tastefully printed and bound in flexible cardboard.

# De Haven & Co., Limited,

Allegheny, Pa., send out a catalogue Allegheny, Pa., send out a catalogue that is especially pleasing, coming from a dingy city. It is a light and tastefully covered pamphlet of 70 odd pages, giving an account of their extensive line of goods. The cover, of cardboard, is impressed with an exceptionally handsome conventional design printed in purple ink and bearing sign, printed in purple ink and bearing within a foliated panel an inscription relating to the Cinderella stoves and ranges. Beginning with an aunoucement to the trade respecting the grates furnished with the stoves and ranges, the superior quality of their fire brick, &c., the catalogue itself opens with an account of the Royal Cinderella range, which is an entirely new high finish, first class range for hard or soft coal or wood and made with fire box at either the right or left hand end. This is followed by the Royal Cinderella, a somewhat more elaborate construction, shown in two styles. double oven range is a substantial and attractive article. The Cinderella Kitchener, for hard or soft coal or wood, is next illustrated in four styles, and then the Queen Cinderella and the Cinderella portable range, in five styles. The Lady Cinderella, in two styles, completes the assortment of ranges. pietes the assortment of ranges. The cook stoves, which embrace an extensive line, include the New Cinderella, Cinderella C, Fairy Cinderella, Princess, Cinderella A, Allegheny, Cinderella B, Virginia and Keepsake. The Cinderella portable range is also included in this section. The parlor heaters are next taken up, with the Magic Cinderella, Cinderella Oak, King Cole and various styles of cylinder stoves. Franklin stoves of different design are illustrated, and then come a number of cheap heaters and also laundry stoves. At the close reference is made to hollow ware, natural gas burners and several miscellaneous articles.

### He Wouldn't Have the Stove.

L. M. W.

He was a shifty old farmer who believed in pleasing his eye when it cost him no extra money. He had dickered and finally loaded up a Todd stove, and drove down the street to another stove store, where a second Todd stove struck his eye. He stopped his team, went in, looked at the stove and concluded he would a good deal rather have it than the stove in his wagon. He got into his wagon and drove back where he bought the first Todd, and stated the case, but as the dealer could not buy the other stove, and had been to all of the trouble of getting the first one ready and loading it up, he said he would not refund the cash and take the stove back, as it was as good as the other stove and he would guarantee it. The old man said if it was guaranteed he reckoned that he couldn't growl about the bargain, though he liked the other stove better. He returned in a few days and stated that every time he made a fire the stove "leaked," and if it wasn't stopped he intended to return the stove and get his money. The dealer said he would drive out and make it work, but after two unsuccessful attempts he was told that the family wanted fire, and as the stove was guaranteed he thought the dealer had better take it home with him, and as he "thought" it with some force it was taken away. When the farmer was in town he called for his money and took home one of the other stoves. After a short time the farmer was asked how the other stove worked, and he said, with a chuckle, "as pretty as a field of ripe oats." That chuckle excited suspicion, and finally, though the favored stove did not leak, it leaked out that the old man had stowed away some ice in the first stove and used the complaint of leakage to get rid of it so he could buy the stove he wanted.

## ODD PLATES.

CHARLES E. CLARK, 23I to 247 Newberry avenue, Chicago, has issued an extensive catalogue for the season of 1894-95. Mr. Clark claims to handle the largest assortment of stoves in the market, comprising the Radiant Ilome line of ranges, base burners, oaks and parlor heaters, the Barstow line of ranges and surface burners, the Garnet line of four and six hole ranges, the Born steel plate French ranges, a complete line of lanudry and tailor stoves, the Wolf gas cooks and heaters and a great variety of low priced goods. The catalogue covers 112 pages. The ranges illustrated are the Radiant Home, Bono, Wren, New Jockey, Chester, New Rocket, Model New Era, Niagara, Bright Garnet, Model Garnet, Paragon B, Crown Bay State, Grand Bay State, Art Bay State, Ideal Prize, Columbia Prize, Prize Garnet, all of which are cast iron constructions, and the Royal and Born steel ranges. The Born ranges are shown in a variety of styles and sizes, with 4, 6, 8 and 10 cooking holes.

The Astor range is a new departure in a combination coal and gas range, consisting of a coal range with a gas stove attachment which folds up under the high shelf over the range and can be used either in that position or when lowered, and either as an assistant to the range or alone. The cook stoves shown are the Clinton, Magic Pearl, New Magnolia, Magic Prize, Titan, Topaz, Bermuda, Peerless Prize, Magic Perles Farmer, Magic America, Magic Parlor Cook and the Wolf gas table cooker. The heaters are the square Radiant Home, round Radiant Home, Home, Radiant Parlor, Radiant Oak, Flag, Flirt B, Sparrow, Haverford, Gem Bay State, Hub Oval Parlor, Bay State Oval Parlor, Hub Heater, Jewel Hub, Hub Hall, Barstow Hall, Boston, Envoy, Vlolet, Pavilion, Favorite, India, Keystone, Perfect Prize, True American, Magic Columbia, Victor Prize, Magic Oak, Jr., Franklin Pride, Magic Franklin, Fire-side, Laurel, Hub Franklin, Magic Garnet Viking Mammath, Magic Cornet Garnet, Viking, Mammoth, Magic Cottage, Maple Garnet, Magic Irene, Magic Light, Cottage Prize, Garnet Parlor, Wonder, Saxon, Alert, Senator, Etna, Boomer, the Radiant Home open gas stove and the Wolff gas radiator.

THE CLEVELAND FOUNDRY COMPANY, Cleveland, Ohio, issue an 1894 catalogue of gas heating stoves manufactured by them under the general name of Puri-These stoves are made both round and aquare in pleasing designs and in aizes adapted for heating rooms of different sizes. Particulars as to price, size and consumption of gas per hour accompany each stove. A revertible flue gas heater is also referred to, for use with either natural or manufactured gas, as well as an open reflecting stove. The same concern also issue the fall and winter catalogue of their Puritan oil heating stoves. It is made up of 12 pages, on which stoves of different deaigns are shown. Accompanying each cut are the dimensions of the stove, capacity of the tank and the length of time atove will furnish heat. All the stoves are provided with their improved brasa burner and the goods are said to be well made throughout. Reference is also made to the importance of good wicks, which can be supplied by the company named, being specially made

A FOUR-PAGE CIRCULAR of the Paragon steel furnace is received from Isaac A. Sheppard & Co., Philadelphia. The first page is devoted to an enumeration of the features of the furnace and the second and third pages show the furnace with octagon base and with round base. A feature of the last page is an account of the experience of one of their customers with the furnace. A number of testimonials speak in high terms of its operation.

THE PORTSMOUTH STOVE & RANGE COMPANY, Portsmouth, Ohio, are sending out a four-page circular of their Mogul furnace, new this year, with a 19½-inch fire pot, 32-inch casing and weighing 800 pounds, which is presented as a small furnace of great durability.

IT WAS A DULL DAY in the store. Customers were tew and far apart. The manager, who had grown gray in the stove husiness, was a man of imperturbable good humor and vivacious spirits, and never permitted himself to become blue over slow sales. Having so much time on his hands he amused the occasional caller by a new trick he had learned when on a recent visit to Boston. It was an optical illusion, of

a character which was sure to interest and amuse, and if it didn't always result in the sale of a stove it at least cultivated a spirit of sociability. The trick was as follows: Place three silver dollars in this position—

 $\bigcirc$  C

 $A \bigcirc \bigcirc B$ ,

Now, assuming that a line is drawnfrom A to B, thus—

л О----ОВ,

the question is asked, where must the coin C be placed so that its lowest point will be equidistant from A and B, forming a triangle of equal sides? It will almost invariably be found that coin C will be placed too close. The eye is confused in the measurement of the space across the faces of the two lower coins by the space between them.

THE PORTSMOUTH STOVE & RANGE-COMPANY, Portsmouth, Ohio, write that owing to announcements made in these columns they have received many inquiries concerning their Model-wrought steel ranges, several from large importing houses in London, England. They conclude their letter with the statement that it pays to active time.

The Baxter Stove Company, Mansfield, Ohio, advise us that they have added to their line of Round Oaks thisseason the Banner Oak, a very handsome production with all cast jacket, beautiful in design, their patent Ventiduct or hot air pipe being embodied in its construction. Three sizes are made, Nos. 44, 46 and 48, for either coal or wood. To their line of cookshas been added flush side shelves and a number of other minor improvements for the fall trade. The company's traveling representatives are covering the territory included in the States of Minnesota, the Dakotas, Iowa, Michigan, Indiana and Ohio thoroughly.

A HALF-TONE ENGRAVING of the Lehigh range shows a very handsome piece of kitchen furniture on the first page of a four-paged circular from the Lehigh Stove & Mfg. Company, Lehigh, Pa. The inside pages present logical reasons for making a leader of this range, and the last page is a letter from "Johnny" to his "Pop" that is well worth reading.

In the restaurant and kitchen department of the Smith & Anthony Company, Boston, steel ranges are displayed adapted for various requirements, as well as pastry ovens, jacketed kettles for steam cooking, ccfice urns and a varied line of heavy copper and tin cooking utensils employed in connection with hotel kitchens.

THE JOLIET STOVE WORKS, Joliet, Ill., send us their card calendar for the month of August. The card bears a half-tone engraving of Moore's Air Tight Heater, and special attention is called to the dates of the patents under which this stove is made.

WE ARE INDEBTED to the Peninsular Stove Company, Detroit, for a copy of their catalogue supplement for 1894 relating to improvements and additions to the Peninsular line for this season. The first goods noted are the Peninsular wrought steel ranges, ten styles of which are shown; then come the Home Peninsular range, a handsome cast iron construction shown in four styles. The Marvel Peninsular range follows; then the Loyal Peninsular, Rival, Radiant

Peninsular, the latter being a handsome parlor stove, and also the air-tight Peninsular, an illustration showing this latter construction without the casing. The Oak Peninsular is the last noted in the pamphlet. Interleaved in the catalogue are slips printed in red announcing that they manufacture a complete line of hot water and warm air furnaces, and that the handsome high shelf, which will fit any Peninsular cook or range, can be had at a low price, which is quoted, and other interesting announcements.

A MINIATURE MAIL BOX comes to us by mail from the Michigan Stove Company. It is attached to the reverse side of a card. On pulling up the lid of the box circulars are disclosed, one of which gives the exact location of the Chicago salesroom and offices, and another ahows the patrons of the com-pany the extent of the latter's national advertising system and how to take advantage of it in reaching local trade.

IT HAVING BEEN INCORRECTLY stated in press dispatches from Chicago that the Chicago Stove Works, Chicago, suffered severely by a recent fire in their vicinity, the company inform us that the report is a mistake, as they have suffered no loss whatever either by fire or water. They say, however, that they had a very close call, which gave rise to the statement in the newspapers.

THE WESTERN STOVE MFG. COM-PANY, St. Louis, Mo., are sending the trade pictures of their Delmar base heater for wood which is made both plain and full nickeled. It has a reverse draft which causes the gases to pass twice around the stove increasing its heating power and enabling a fire, it is said, to be kept 36 hours with wood.

THE WEIR STOVE COMPANY, Taunton, Mass., send out to their friends in the trade a pretty circular as the Glenwood Announcement for 1894, in which they ask the trade to wait for the Glenwood man, and say further that new Glenwoods have been added to the family for the season of 1894. The Grand Glenwood square parlor is a sur-face burner which they specially allude to; also their Glenwood parlor, a round indirect draft stove; the Daisy Glenwood parlor is referred to and briefly described. They add that they are now putting steel radiators on their whole line of furnaces so that they can be supplied with either cast or steel radiators. Combination heaters for hot water and hot air is another line that has just been completed. Of further interest to the trade is the haudsome aouvenir which they are distributing with the an-nouncement. It is a leather card case suitable for the vest pocket, neatly made and finished and containing four pockets for money (if any of the stove men happen to have it this year) or for Within is a calendar with a few pages of interesting information and then blank pages for memoranda.

FERRIS & Sons, 813 North Twentyfirst street St. Louis, Mo., distribute circulars relating to the Queen wood It is a sheet iron construction of oval shape, and la described as the only stove with a draft on top. From a broken view it appears that the smoke flue extends down inside of the store. The advantages alluded to are the small amount of kindlings it takes in starting a fire, and the great heat it gives out. Special emphasis is laid upon the statement that no ashes can get on the floor.

THE ANNUAL CATALOGUE issued by J. A. Comstock & Co., Tenth and Hick-

ory streets, Kansas City, Mo., is a convenient sized pamphlet of 80 pages, bound in green paper, with embossed The catalogue and price-list gilt title. relate to stoves, ranges, hollow ware, &c., and present illustrations with full descriptions of an extensive line of goods of this sort. It is the tenth annual catalogue of the concern, and as the publishers mention, each year they have made changes and alterations to provide a more and more complete line of goods. The first illustrations in the catalogue relate to ranges, both steel and cast, which are followed by an extensive line of cook stoves; then come parlor stoves of very ornamental con-struction, adapted both for wood and coal. Todd atoves of many atyles are shown, likewise Oaks. The cheaper grades of stoves are shown in large varicty, as well as small atoves for laundry purposes. At the close reference is made to cast iron hollow ware, enameled hollow ware and granite iron ware.

JAMES LAWRENCE, the knight of the quill at the establishment of Sam S. Utter, New York, has returned to stove accounts after a three weeks' sojourn among the hills of Connecticut taking on tan and avoirdupois. On one of his annual trips he acquired the art of writing with either hand, with equal facility, and the ability to foot up columns of figures with magic swift-

THE THOMAS - ROBERTS - STEVENSON COMPANY, Philadelphia, have purchased a shop right and are using the Graves permanent gas burner attachment on some of their popular ranges. The attachment is a very seasonable attraction and renders excellent service in opera-

SOUTHARD, ROBERTSON & Co., New York, are sending out a four page circular of the Savoy range printed in Two cuts are used, one showing a square range with Cabinet base and the other showing the range with a flush cover reservoir. The second page enumerates enough selling points to make a man buy one who had started to buy a refrigerator. They have end ash pits with ash pans, ventilated ovens, Reed's damper, duplex grate, and have burnished edges, in addition to full nickle trimmings. The trade is invited to send for the new catalogue just issued by Southard, Robertson & Co.

The output of gold in the seven British Australasian colonies shows a steady increase year by year. In 1893 it is reported as 1,876,562 ounces, as compared with 1,796,130 ounces in 1892; 1,651,-151 ounces in 1891; 1,599,350 ounces in 1890, and 1,739,750 ounces in 1889. Gold is found in each of the seven colonies, but Victoria headed the list last year in respect of the importance of her production. Queensland ranked second; New Zealand, third; New South Wales, fourth; Western Australia (Mr. 2014) tralia, fifth; South Australia, sixth, and Tasmania, seventh.

According to the figures of the Bureau of Industrial Statistics, published at Harriaburg, Pa., the output of the bituminous coal mines of Pennsylvania last year was 43,421,898 tons, a decrease of 1.164,678 tons from the production of 1892. In the anthracite coal region the output was 47,179,563 tous, an increase of 1,444,169 tons over 1892. The number of men employed in bituminous mines in Pennsylvania was 81.800. In the anthracite region 78,-789 is given as the number of miners.

The Lowering of Wages.

The tendency of wages, says TI: Iron Age, in sympathywith the tendency of prices for the past three years, is downward. The movement is resisted by all the means avaitable to those who are obliged to work for others, but its force is irresistible. The most formidable strikes known in our in lustrial lustory have been undertaken in the hope of restorneen undertaken in the nope of restor-ing past schedules, but they have either been successful in only a slight degree or they have proved inglorious failures. The trend of all values being downward, the price of labor goes down also. The recent coal and railroad strikes were crucial tests, and now that they have been met and passed the question seems to have been settled. Until the general condition of business improves there can be no restoration of wages to former standards, and there is no guarantee standards, and there is no guarantee that further reductions will not have to be endured by those who are now working for much less than they consider their services worth. Railroad revenues are still shrinking, manufacturers incomes are still diminishing, merchants sales are still falling off, and it is only reasonable to suppose that employees will have to bear a greater part of the burden of hard greater part of the burden of hard times than has yet been imposed upon or assumed by them.

In certain occupations, which are

hedged about by agreements with a time limit, no change in rates can be made. The workmen in such trades, however, are likely to be losers in the amount of their yearly income from the irregularity of employment. Numberless other occupations exist, however, in which time agreements are not made and wages can be changed by mutual consent whenever conditions may seem to require a rearrangment. In such lines the lowering tendency is now proceeding. It is not forced specially by employers, but is assisted by employees themselves. For instance, workmen whose usual wages are 35 cents per hour in good times are offering to work for 20 cents in order to get employment. This is being dono in a Western city in which labor is supposed to be as strongly organized supposed to be as strongly organized as in any other place in the country. Lack of regular employment is, of course, the cause. After a man has averaged less than half time for a year he concludes that more steady work must be had if possible. Having only his labor for sale he proceeds to offer it at a bargain, in the hope that he may find an appreciative buyer. Probmay find an appreciative buyer. Probably the expectant employer has helped ably the expectant employer has helped the downward plunge in wages by making a low bid for the workman's services, but he too is seeking work and is struggling to secure contracts on which he must reduce his costs. This acceptance of hard times condi-tion is believed to be widestread, and tions is believed to be widespread, and will shortly affect the great mass of wage workers unless there is a radical change in general business, which is unfortunately not to be expected in the near future. Those who maliciously near future. Those who maliciously assert that employers are taking advantage of the times to reduce wages rantage of the times to reduce wags falsify the circumstances. An occasional instance may be found in which a man will wantonly grind the faces of those dependent upon him, but it is the exception and not the rule. Reductions in wages are almost invariably the last resort to reduce costs. We have sufficient faith in human naturo to believe that employers generally are more pleased when they are able to increase the compensation of their employees than when they find them-selves obliged to make a reduction.

# TRADE REPORT.

### The Iron Market.

The business community is growing very impatient over the delay in Congress because the danger that the fall trade may be seriously interfered with is becoming imminent. The Iron trade has discounted the worst that may happen, so far as the Metal schedule is concerned, and is chiefly eager to experience the improvement in business which It is generally believed will follow the settlement, whatever shape it may take. The conviction is general that a good many negotiations have been held in abeyance preceding a decision, and that the Iron trade must share in any revival which may follow the present state of suspended animation.

Pig Iron.—The demand continues very light and the trade is dull. There is an inquiry in the market for about 1000 tons of Warrant Iron. We quote standard brands \$12.50 @ \$13 for No. 1; \$11 @ \$12 for No. 2, at tidewater. Southern Iron, same delivery, \$11.50 @ \$12.25 for No. 1; \$10.50 @ \$11 for No. 2; \$10 @ \$10.25 for No. 3; \$10.25 @ \$10.75 for No. 2 Soft, and \$10.50 @ \$11 for No. 1 Soft. Foundry Nr. 4 (Foundry Forge) is \$9.75 @ \$10.25

Our Philadelphia correspondent says: The tendency of the market is somewhat favorable to holders. It is much casier to do business, and while no improvement in prices can be noted there is no difficulty in placing all the Iron that makers desire at figures recently ruling. Furnaces are in first-class condition, some in fact have stopped taking orders until they see what course business is likely to take in the course of the next 30 days. Things are not in such shape as to warrant holders in asking an advance, but, as already mentioned, some are disinclined to accept further business at current rates, believing that in the near future prices will be better, and in any event they are sold pretty well up to the end of the year and can, therefore, afford to wait developments. Inquiries are said to foreshadow a good demand during the next 30 days, which, following liberal sales during the past couple of weeks, is very encouraging to makers of Pig Iron. General quotations for Philadelphia and nearby points are about as follows:

 Standard No. 1 Foundry X.
 12.50 @ 13.00

 Standard No. 2 Foundry X.
 11.50 @ 12.00

 No. 2 Plain.
 10.75 @ 11.00

 No. 1 Soft.
 11.50 @ 11.75

 No. 2 Soft.
 10.75 @ 11.00

From \*Chicago we have the following: Local Coke Iron has sold to about the same extent as reported last week. Shipments have increased beavily during the week, as foundrymen are now endeavoring to make up for loct time during the recent railroad strike. Southern Coke Iron has sold in only small lots, as usual, but agents report that they are offered long time contracts, which their principals are not willing to accept. The Southern companies now running are not burdened with large stocks and believe in peddling out their Iron in small lots rather than to anticipate the future,

which they believe will ere long bring about better prices. Not much business is reported in Lake Superior Charcoal Iron. Quotations are given as follows for eash:

Lake Superior Charcoal	\$14.25 @	\$15,00
Local Coke Foundry, No. 1	10.25 @	10.50
Local Coke Foundry, No. 2	10,00 @	10,25
Local Coke Foundry, No. 3	9.50 B	10,00
Local Scotch	16,25 @	10.50
Ohio Strong Softeners No. 1	13.00 @	13.50
Southern Silvery, No. 1	@	
Southern Silvery, No. 2	Ø	
Southern Coke, No. 2	10.75 @	11.00
Southern Coke, No. I	10.50 @	-10.75
Southern, No. 1. Soft	10.75 @	11 00
Southern. No. 2, Soft	10.50 ത്ര	10.75
Tennessee Charcoal, No. 1	@	
Tennesseo Charcoal, No. 2	···· @	****
Alabama Car Wheel	17.50 @	18,00
Jackson County Silvery	15.25 @	16.00
Other Ohio Silvery	14.25 @	14.50
4 t Toller 1 1 4 1 T		

At Pittsburgh foundry Iron shows no change over last week. The demand is light, but there is not much offering and prices are being sustained. For August and September delivery we quote as follows:

Our Cincinnati correspondent reports: The market has been working under the stress of a searcity of the grades of Pig Iron most in demand during the week and sellers have been able to obtain very full prices for the little they have had to offer, but the sales were mainly of single car lots, but sometimes ran up to 500 tons. Prices are not quotably higher, and yet an advance is obtainable for small lots for prompt delivery. Quotations are as follows:

Southern Coke, No. 1 \$10.25 @	\$10.50
Southern Coke, No. 2 9.50 @	9.75
Southern Coke, No. 3 9.25 @	9.50
Ohio Soft Stone Coal, No. 1 14.50 @	15.50
Ohio Soft Stone Coal, No. 2 14.00 @	14.50
Lake Superior Coke, No. 1 12.50 @	13.00
Lake Superior Coke, No. 2 11.50 @	12.00
Hanging Rock Charcoal, No. 1., 16.00 @	17.00
Hanging Rock Charcoal, No. 2., 15.50 @	16.00
Tennessee Charcoal, No. 1 13.00 @	13.50
Tennessee Charcoai, No. 2 12.00 @	12.50

From Birmingham we have the following: A visit to all the furnaces reveals still decreasing stocks of Iron. The demand for Soft Irons is still in excess of supply and is especially good in the Northwest and Chicago territory. There has been no loss of business in that territory to Southern producers, as they are practically out of the market, with no inclination to take new orders except under higher quotations. No. 1 Foundry is in rather light demand, also Gray Forge. Some new orders have been accepted at following prices, as seen personally on the order books: No. 1, \$8.50, \$8.90, \$9; No. 2 Foundry and No. 1 Soft, \$7.60 @ \$7.95; No. 2 Soft, \$7.75 @ \$7.85. General quotations range as follows: No. 1 Foundry, \$8.50 @ \$8; No. 3 Foundry, \$7.25 @ \$7.50; No. 1 Soft, \$7.50 @ \$8; No. 2 Soft, \$7.50 @ \$7.75.

The Nubian Iron Enamel Company of Chicago are distributing a quaint advertising device. It is a piece of transparent toilet soap in which a card is imbedded, bearing appropriate printed matter, which can be read through the soap on either side. The device is similar to a glass paper weight and its novelty attracts attention.

# Metal Market.

Pig Tin.—Prices have varied to a very slight extent during the past week, and for small lots there is no change whatever to report. Under the influence of careful nursing wholesale prices were carried up a trifle above the extreme lowest point of the month. The method of making quotations had, however, no perceptible influence upon buyers. Consumers have purchased in a most perfunctory manner. Dealers have bought only as supplies needed replenishing. Speculative dealings were very thin. A large supply remains in sight. In fact, there is so much of it that the leading operators experience more than ordinary difficulty in regulating prices.

Copper.—Competition for business has been livelier. Some sellers of Lake Superior Ingot quietly closed orders that for some time have been under consideration for September and later delivery. In small lots prices remain unchanged.

The exports of Copper from the United States during the month of June, as recorded in the report of the Bureau of Statistics, were as follows:

Ore— To United Kingdom	Tons. 127	Tons. 5,951
Totals	127	5,951
Ingots, bars, &c.—	1894. Lbs.	1893. Lbs.
To United Kingdom To Germany To France	6,828,486 $1,597,684$ $914,239$	1,127,175 884,841 1,828,475
To other Europe To elsewhere	3,668,673 40,600	3,733 642 171,332
Totals	13,049,682	7,745,465

The movement during the 12 months ending June 30 is given as follows:

Ore— To United Kingdom To Germany	1894. Tons. 22,464 1,016	1893. Tons. 41,163 106
Totals	23,480	41,269
	1894.	1893.
Ingots, bars, &c	Lbs.	Lbs.
To United Kingdom	74.611.789	5,589,214
To Germany	24.998.854	5,074.337
To France		12,536,800
To other Europe	66 095 810	14.026.344
To eisewhere	698,383	435,769
Totals	195,047,642	37,642,464

Pig Lead.—In a wholesale way prices have gone a fraction lower under the influence of freer offerings for shipment and delivery this month and next. There is active speculative interest in the market, and the elasticity that has characterized values was due chiefly to caution about taking broad risks on tarlff revision.

Spelter.—Only routine business of most pronounced conservative type has been effected in this market. The offering has not been particularly heavy, but in the present dull condition of the market sufficient to keep values rather weak. Fancy brands command about the usual premium. Sheet Zinc is unchanged from a week ago.

Tin Plate.—There is no more to report this week than there was a week ago, which is equivalent to saying that the market is dull and featureless.

There is but little buying by consumera and prices are fixed. In the wholesale market business has been uneven and, upon the whole, rather below the average for this season of the year. Inquiries are spiritless, with little interest shown in venturing beyond well-defired wants. The Government returns show that 454,000,000 lb were imported during the 12 months ending June 30, against 628,500,000 lb the previous year. In the face of this decrease the stocks in bonded warehouses increased from 32,187,000 lb to 48,968 000 lb. This speaks for itself.

# Chicago Report.

Scrap.—Cast Scrap is about the only kind of Old Iron now moving to any extent. Dealers quote the following list of buying prices, Chicago delivery:

	net ton.	Per lb
No. I Wrought Scrap	\$7.00

BUCK'S STOVE & RANGE COMPANY, in their double page advertisement which appears in another part of this issue, illustrate a few of the new goods which they are putting on the market. Their line of Steel Ranges is particularly complete, and are adapted for hard or soft coal, coke or wood. Buck's Royal is a new air tight heater, which, in addition to being very attractive in appearance, has many valuable features which will doubtless make it a ready seller. Buck's Superh, for wood, and Buck's Round Oak and Buck's Square Oak are also illustrated. The company advise us they have full and complete stocks, and are in a position to fill all orders promptly.

### CONDITION OF THE

# Hardware Trade.

THE only notable change in the condition of the Hardware market is the placing of a number of large orders by some of the Western jobbers, who are putting themselves in a position to be ready for an increased business. Orders are, however, in general light, it being no unusual thing for the largest houses to telegraph small orders for express shipment. Everything points to the fact that stocks are everywhere very low, and that when any active demand sets in there is likely to be a scarcity of goods. The crop reports are generally favorable and collections are on the whole satisfactory.

Advices from Chicago.—The volume of business in Shelf Hardware is steadily growing. Country merchants continue their policy of ordering only to cover their actual wants, but their wants are evidently increasing, as orders are larger. The crop question is the absorbing topic in trade circles but the damage by drought is believed to have been exaggerated. There are large sections of the Northwest in which good crops are almost assured, and farmers in these sections will be greatly benefited if the advanced price holds on corn and other late farm products. Jobbers are inclined to take a very hopeful view of the situation on the whole and look forward to a larger fall trade than that of last year. They are advising mannfacturers of Hardware not to weaken in prices in order to encourage business, but to exercise a little patience until the demand improves, when the question of price will be subordinated to the more important matter of getting goods that will be needed. Stocks are so light and production has been so greatly curtailed that if the demand for staple articles assumes even fair proportions a decided scarcity will be felt. Heavy Hardware is less active than it has been, and August promises to be a dull month in this line.

### Notes on Prices.

Wire Nails.—There is a notable increase in orders for Wire Nails, and with the very small production at present going on atocks are light and steadily decreasing, but prices are no better. The New York price for small lots from store is \$1.30 to \$1.35

Advices from Chicago. — Manufacturera are doing almost nothing in this market. Inquiries have fallen off. The consumption of Wire Nails is light at present, and merchants are in no hurry to buy, taking chances of manufacturers weakening if the dullness continues for any length of time. Meanwhile the leading Wire Nail companies profess indifference and say that if small concerns feel impelled to make lower prices they will not follow them, but will wait for the advent of fall trade, when they feel sure that they can sustain themselves. Small lots from store are selling at \$1.20.

Cut Nails.—There is more doing in Cut Nails, but no change in prices. The store price in New York is \$1.10 to \$1.15.

Advices from Chicago. — Manufacturers report a moderate trade. Jobbers quote small lots \$1.10.

Barb Wire.—There is no change in the position of this article. It is not the season to look for any active demand, and such orders as come along are filled at unchanged prices.

Advices from Chicago.—The limited volume of business now in progress is taken by manufacturers at unchanged prices. They state that conditions are such that they do not apprehend a break in rates. Factories have not yet started up to any extent, and will be kept closed until the demand is greater. Jobbers are doing very little in this line and continue to quote small lots of Calvanized at \$2.35 to \$2.40, with 10 cents off for carloads.

Wringers.—The Lovell Mfg, Company of Erie, Pa., have put on the market a new line of Wringers, which they style the Guarantee. They inform us that these goods are made to supply a line of trade who want the best that is to be had regardless of cost. They emphasize the quality of the rolls and say that the prices in these Wringers have been fixed at as low a tigure as is consistent with a reasonable profit, and that whatever competition may be brought out, they will make no concessions in price nor deteriorate the quality. The following are their list prices for this line, the discounts being the same as on their other Wringers:

No.	Size of Rolls.	Price per doz	Size of Rolls.	Price per doz.

Spreed	r rops,	46 1			
		1			2.00
4.4		" 2			1.80
4.4	4.6				1.60

This reduction in Spittoon Tops will make the Spittoons considerably less in price. No. 3 Spittoon will hereafter be only 9 inches in diameter and will list at \$4.20 per dozen. No. 2 will be 11 inches in diameter and will list at

\$4 \$0. No. 1 of the present size would list at \$5.40, but it is proposed to change the size and make the Spittoon about 13 inches in diameter. The price on this size has not yet been determined. The No. 0 size will measure 15 inches in diameter instead of 16 inches as heretofore, and will list at \$7.80. A new catalogue of the Ware has just been issued.

Glass.—A redeeming feature of the present condition of the American Window Glass trade is the comparatively small stocks in manufacturers' hands. The falling off in demand, which has been noticeable in the Glass market for the past two or three weeks, continues, and indications are not encouraging for an immediate change in this direction. Prices are weak, and while factory quotations are 85 and 5 per cent. discount for single, and 85 and 10 per cent. discount for double strength Glass, it is understood that these prices are shaded in some instances. Western jobbers are quoting 85 per cent. discount for single, and 5 per cent. discount for double strength Glass in full boxes. American Plate and imported Window. Glass remain unchanged in price and demand.

Old Metals,—The following quotations represent about the rates now paid by New York dealers:

Chas. Noble & Co. of Philadelphia are, in another part of this issue, calling attention to the Liberty Steel Range, which they have placed on the market this season. It is made in several sizes, in portable and brick set styles, and will no doubt take well with the trade.

## Trade Notes.

A CIRCULAR distributed by True & Blanchard, Newport, Vt., calls attention to the Eureka Strainer Milk Pail, which is made with a removable strainer so that it may be readily cleaned with little trouble. An illustration on the circular shows the appearance of the pail with the strainer removed. This device will be appreciated by the trade who are familiar with the needs of the farmer.

Marlin & Co., Incorporated, Allegheny, Pa., make a full page announcement in this week's issue that will be of interest to the roofing and kindred trades. They show various styles of Eave Troughs, Conductor Pipes, Ridgings and Skylights. The special features of their goods are mentioned and the trade are invited to send for their 80-page catalogue which has just been issued.

THE KING & WALKER COMPANY, Madison, Wia., have purchased the foundry and machine shops of M. H. Ball of that place.

THE ELMIRA STAMPING & PAPER MFG. COMPANY, Elmira, N. Y., are making a fine line of galvanized iron oil cans, called the Elmira. They also manufacture a 1-gallon glass oil can with paper jacket, which they claim is an exceptionally excellent article.

THE FERRACUTE MACHINE COMPANY of Bridgeton, N. J., manufacturers of Presses and Dies, are running on full time and are filling a number of ordera for machinery from their new patterns. Among their most recent orders are six Punching Presses for a new eyele fitting factory in Ohio, a large round bed Press for cutting armature disks, with a complete set of Dies, and also a smaller Presa with notehing attachment for the Press with notening attachment for the armature disks, for a motor factory in Ohio. They are also fitting up a factory for manufacturing Miners' Lamps, and another for a new toy, and they have recently completed several Drawing Presses for making deep steel abells, lantern work, tin ware, &c., for various firms over the country. They emoody a great many improvements in their new Presses and have a new form of clutch which is extremely simple and durable. They are about getting out a new catalogue describing 300 different styles of Presses they build.

The glue interests of the United States have been consolidated under the name of the American Glue Company, with a capital of \$2,100,000. The new combine is said to include most of the leading factories of the country.

Shipments of petroleum from the port of Philadelphia during the first half of this year have been 161,082,000 gallons, showing a gain of 11,000,000 gallons over the shipments in the same period of last year.

By the preliminary report of the operations of the Internal Revenue Bureau for the last fiscal year, recently submitted to the Treasury, it appears that the total collections of internal revenue in the United States for the year were \$147,168,442, a decrease of \$13,836,547 as compared with the previous year. The percentage of cost of collection was 2.70, being an increase of 0.08 over the previous fiscal year. The principal sources of the receipts were: Spirits, \$85,259,546, a decrease of \$9,400,714;

tobacco, \$28,617,898, a decrease of \$3,271,813; fermented liquors, \$31,-414,493, a decrease of \$1,134,489, and oleomargarine, \$1,723,479, an increase of \$52,836

# Tin Plates and the New Tariff.

The event of the past week in business circles was the passage of the tariff bill which, at this writing, is awaiting the signature of the President, and the general opinion is that it will become law. Our readers are especially interested in the clause relating to tin and tin plates. Tin is placed on the free list, and tin plates arered uced from 2.2 cents per pound to  $1\frac{2}{10}$  cents per pound. The effect on the market has not yet been felt, the stocks at present being exceedingly small and broken, and the large quantities in bonded warehouses being out of reach except on payment of the prevailing duty. Interest centers in the position of the American manufacturers under the new rate. The opinion prevails that profits in making tin plates, where the manufacture of black sheets and the dipping have been done by one concern, have been large, and it is believed that such works will continue to operate and meet the Welsh plates in competition. The McKinley law had the effect of advancing plates about \$1 a box, but since it went into effect prices have receded and what practically amounts to the same thing, consumers have in many cases taken up with lighter weight plates, and even a poorer quality, so that plates used for the same purpose are now back to within 50 cents a box of the price prevailing before the McKinley tariff went into effect. It is not expected, therefore, that the reduction of 1 cent a pound will lower the market here another \$1 a box, though if the Welsh market goes down sufficiently, such lower prices will be possible.

## American Dipping Works.

The outlook for the dippers in this country, those who have dipped their plates and depended upon domestic or foreign manufacturers for black sheets, is not promising, for while the duty on

the plates has been cut down 1 cent a pound the duty on the black sheets has fallen less than 1, cent a pound. This will tell very strongly against the use of imported sheets, and whether or not they will continue to dip depends upon the price at which they can purchase the domestic article. The firms who own their pots and sell direct to the consumers have, to be sure, the advantage of the dealer's profit, but it is uncertain whether with it and the saving due to free tin they can operate profitably. While it is generally conceded that the American manufacturers who roll their own plates will continue working, the profit will necessarily be smaller than heretofore and the temptation for new capital to go into that line of enterprise will be lessened. The industry may grow until eventually the entire home demand is supplied, but the leaps and bounds by which it has progressed during the past two years will be restricted hereafter to slow and well considered steps.

### Figuring for Contracts.

In the midst of what is generally admitted to be a dull business period it is notable that many tradesmen are busy. They are employed in figuring on plans with the hope of securing the contract for the roofing, plumbing or heating. The practice of everybody who has a little or large job to be done is to get figures to a greater extent than ever before, which is partially due to the persevering search for work by contractors. This has brought a great number of plans into the market, and the amount of time spent on the plans will never be paid for by the profit in the work that will be done. As a natural result out of a great number of bids made very few contracts are closed. Some have asked for bids on projected buildings with the hope of getting a greatly reduced figure, as material of every kind is at its lowest price, and have been disappointed at the figures received and the projected work is never carried out. This leads to an unfortunate state of affairs for two reasons: the buyer thinks that the prices are not as low as they should be, and the bidder thinks that some one has underbid him.

## Cost of Work.

The price of labor in plumbing, pipefitting and tinning for really good workmen has not varied greatly for some years; consequently, very little reduction in the cost of work can be looked for in that direction. Shop rent, clerk hire, insurance and all of the incidental expenses of carrying on a business have not reduced in cost.

When the price of material two years ago and the price to-day are compared there is no good reason why a bid for any kind of work should show a great reduction, yet it is expected to do so This is unfortunate, and if it was possible would lead to a cut in estimates, as there is some evidence of demoralization, if reports be true. It requires, however, considerable courage to maintain prices when making bid after bid, and closing only here and there a contract at the figures quoted. There has been a great deal of quiet determination to get whatever was in sight this year, and those who have been most successful are those who have thoroughly explained, whenever possible, just what was needed and what they intended to do. Some of these bidders have closed contracts even this year, when they were by no means the lowest bidder. The assertion that money talks is generally believed; but that a well-informed tradesman who explains his intentions so as to gain the confidence of his customer can silence a low bid is oftener true than is generally realized. Good work cannot be done at cut rates.

# Electric Ventilation.

Properly speaking, this is mechanical ventilation effected by electricity as a motive power. Go where one will, small fan blowers driven by electricity are now a familiar object. These have rendered life in banks, stores, restaurants and even private dwellings far more endurable in sultry weather than was formerly the case. So far, the electric current for driving these fans is for the most part taken directly from wires used for lighting and other purposes. Some, however, are driven by battery power, and as the storage battery becomes gradually improved it will more and more be used for this and similar purposes. The storage battery, while not yet fulfilling the promise it seemed to held out when first introduced, is yet constantly advancing in usefulness. Electric ventilation, like electric lighting, has come to stay. The heating and ventilating trade, not only by this innovation but also in other ways, is becoming more related with electrical engineering as time advances. By the use of electricity, low pressure steam heating and mechanical ventilation can often be advantageously carried out together. When this is done a skilled engineer may be dispensed with who would otherwise be necessary to attend an engine and boiler for driving the fans.

The coal miners at Spring Valley, Ill., have voted not to resume work. The company decline to recognize the union.

# THE LETTER BOX.

Joining Porcelain Lined Soil Pipes.

From E. S. W., Mechanicsburg, Pa.— In putting up porcelain lined soil pipes are the joints made with hot lead, or will that injure the lining; and what is the best way to make the joints if the heat interferes?

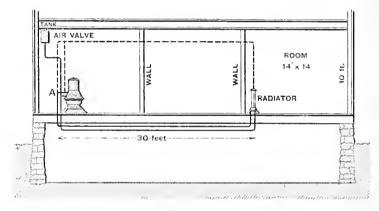

Note. - The practical methods of our readers in work of this kind will undoubtedly prove of interest to our correspondent. We have no information at hand as to the method of making the joints in porcelain lined pipe. joints between the frequently used porcelain lined traps and ordinary soil pipe are made by the usual manner of calking with oakum and pouring on hot lead, which is calked when cool. From this it would seem that there is no reason why the joint should not be made in the same way. Cast iron pipes are frequently put up with rust joints, but difficulty is experienced in making repairs when needed.

### Leaky Block Tin Pipes.

From T. J. P., Philadelphia.—I send herewith a piece of block tin pipe and would call your attention to the blister between the two small cross marks, which made its appearance on the pipe after use. The pipe is a portion of a coil used in connection with a beer pump. Several of these swellings appeared along the center of the coil on the bottom side, and after a time holes formed in the pipe. Is this a common occurrence, and can you give a scientific explanation of the cause?

Note. - We shall be glad to hear from any of our readers who can give any light on this subject. The sample of pipe received is generally conceded to be of high grade quality, about 8-ounce weight, and measures ! inch outside diameter. On one side is a small awelling 3 inch ln diameter and about 3 g inch nigh, the surface of which shows granulation and which under test leaks air. From the size and shape of the awelling it would be supposed to have been formed by pressure on the inside, but the inside surface is perfectly true in form. Leaks are not unusual in the tin coils used for cooling in aods water fountains and in connection with beer pumps. Sometimes the leaks grow from the appearance of a very small black spot, which develops into a hole. On inquiry as to the cause of the leaks other pipe has been shown that at places looked like a worm eaten piece of wood and at another place for a space of 3 inches and for one quarter of the circumference of the pipe it had an appearance similar to what would result from the pipe being made of dross. Among those who have experience with these coils the leaks are not an unusual oc currence. The cause, however, has not been discovered and is looked upon as a mystery similar to the pitting of a boiler tube. One opinion expressed is that the leaks are due to chemical action, but just how brought about is not explained, although pipe is said to give out much quicker when the coil lies in a tank lined with plain or planished copper than when the copper is heavily tinucd. In some cases these tanks are not kept clean and beer is spilled in them, so the coils are exposed to an acid effect as well as the gases of fermenta- |

coil exposed on all sides and above suificient fire surface is recognized as one of the best of water heating surfaces, and it is possible that I square foot of heating surface in such a coil would heat 20 feet of surface in the radiator. A coil, therefore, having 2 square feet of surface will be required in the stove, or about 6 lineal feet of 1-inch pipe. If hot water is to be drawn from the heating system, a larger amount of heating surface should be provided in the coil, and a supply of cold water arranged for to take the place of the water drawn eff. A ball cock in the expansion tank would probably answer the purpose. The drawing of water in

Piping from Stove Coil.

tion. We have heard no reliable explanation given of the cause of the trouble.

### Piping from Stove Coil.

From J. W., Memphis Tenn.—I send sketch of a heating arrangement I propose using, but as I am not well versed in this business, would like your opinion of the same. Will it work as shown in the sketch? About what size of coil should be used in the stove, and what size of radiator employed in the room to be heated? Can hot water be drawn from the pipe near the stove? Very little hot water, however, will be used. Please make any suggestions that would improve the system and keep the piping under the floor.

Answer.—A heating engineer would require, before answering the questions submitted, more detailed information as to the surroundings, &c., but to aid our correspondent in a general way we present the following: The room, according to the sketch, is 14 feet square with 10-foot ceiling and located 30 feet distant from the stove. About 2000 cubic feet of space is contained in this room, and on the basis that 1 square foot of heating surface will heat 50 cubic feet of space, 40 square feet of surface would be required in the radiator. A

large quantities from the system in cold weather, however, would have a tendency to cool the surface of the radiator and the coil, thus affecting their heating efficiency. It is doubtful if circulation would take place in the piping shown on the sketch except so slowly as to be useless. If the pipes must be run below the floor so as not to be exposed in the intervening room it can be done as shown by the dotted lines at the left by running the flow pipe up near the ceiling, then returning it to the floor and passing along to the radiator, not forgetting to place an air valve at the top of the aiphon. Another and better method, though it would expose the pipe, would be to run the pipe to the ceiling, then over and down to the radiator, and returning the pipe under the floor, as shown by the dotted line.

### Needs a Relief Pipe.

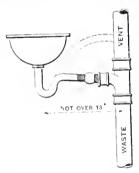

From I. F. G, Lebanon, Pa.—Some time ago I put up a large range, connecting an 80-gallon circulating boiler with it, which was fed from a tank on an upper flor. On some days when the range is run hard the water gets too hot, producing steam in the boiler, which is partially relieved by allowing the hot water to run off, hu: as the

aupply of water must be pumped to the tank, some way of avoiding this waste is desired. Will a pipe connected with the top of the boiler and running up to the top of the supply tank stop the noise in the boiler, or is there a better plan?

Note.—If our readers have anything to contribute on this subject it will no doubt be appreciated by this correspondent. Sometimes a safety or air valve is used at the top of the boiler, and this may be a more simple solution of the difficulty than running a pipe to the tank. However, good results can be obtained by the use of a pipe running from the top of the boiler to a point above the tank, the end of which is bent down so that the condensation will be discharged into the tank, but not beneath the surface of water when at its highest level.

### A Question in Trap Ventilation.

From E. W. S. & Co., Pasadena, Cal.—Having noticed that The Metal Worker publishes answers to questions by correspondents, we take the liberty to send you a diagram of a basin waste and vent. It is claimed by some architects that this trap is not properly vented without the crown vent represented by the dotted lines; we will explain that this is the upper fixture on

A Question in Trap Ventilation.

this line of waste. Please publish an answer to this for the benefit of our customers.

Note.—Owing to the location and conditions it would seem that there would be so little of the pipe unventilated that a crown vent would be unnecessary, but to make a perfectly correct job, both technically and according to the plumbing laws of many cities, the crown vent connected to the air pipe would be necessary.

# Connecting Kitchen Boiler to Furnace.

From C. S., Lakeport, N. H.— I would like to have the opinion of the readers of The Metal Worker on the following job: There is a hot air furnace in the cellar and a hot water boiler in the kitchen on the first floor, the furnace being about 20 feet from the boiler. Can I put a coil of pipe in the furnace and connect it with the boiler so that hot water can be had when no fire is in the range? It often happens in the winter season that the range is without fire, but the furnace is never without heat.

Note. — We hope our readers will answer this correspondent as requested. In this connection we would say that in The Metal Worker during December, 1893, some attention was given to this subject. When the heating coil is properly proportioned to the work and the piping correctly run there should be no trouble.

### Recording Stove Sales.

From S. T. F., Rock Hill, S. C.—Can The Metal Worker inform us where we can purchase a stove register, as we are desirous of keeping a record of our stove sales? We submit a diagram which we think is suitable. We would be glad to hear the views of other dealers on this subject:

# Smoky Chimneys.

From F. H., Durham, Conn.-Last April we wrote your correspondent, "I R S.," Stonington, Conn., regarding his article on defective chimneys, receiving his reply in due time. Within the last ten days we have put his auggestions to practical use on our 40 foot stack. When putting up the stack the mason, who was supposed to be competent, had his own way, making the flue square and 20 inches throughout. chimney has given trouble at times, especially in damp, muggy weather, so we took off the iron cap and reduced the width of the flue and increased the hight by so laying the brick that the flue was reduced 4 inch with each sourse and continuing until the outlet of the chimney was only 10 lnches square. On top of this we put a cast

Note.—We call to mind no book published for this purpose and will be glad to hear from our readers as to the methods they adopt. Such books are kept by many dealers and prove a convenience in later years when repairs are needed for the atoves, as the customer can seldom give the necessary name and features of the stove to insure an order being correctly filled without a delay to get the dates, number and name of the stove with its peculiarities. A properly kept stove sales record for each year renders excellent service for this purpose.

### Stove Polish.

From D. B. Robins, Fredonia, Pa.—I wish some of your readers who are expert stove polishers would give me a receipt for a fine black luster stove polish. I prefer one that is not offensive in odor from benzine or gisoline, if such cau be had. Or what ready made or prepared polish on the market is the best? We have tried many, but all require benzine, and I want to accure one that can be used without it.

iron cylinder 18 inches long, with a width of 13 inches at the base and 10 inches at the top, which we bricked in solid. So far sa we can see this has remedied the trouble.

# Summer Test for Winter Heating.

From G. P., Victoria, B. C—Will you kindly inform me through The Metal Worker what is considered a sufficient test for any heater in summer when the thermometer shows an exterior temperature of 50° or 60°, and in winter from freezing to 40°?

Note. — We shall be glad to have our readers use the columns of The Metal Worker in discussing this subject. This question has received some attention in engineering circles, but no final solution of the problem has yet been furnished.

Attorney-General Moloney has filed a petition for a bill in equity against the Pullman Palace Car Company, calling upon them to show cause why they should not be prohibited from further doing business under the laws of the State of Illinois.

Elevation and Patterns of Offset Elbow.

From W. 11. E., Fall Ricer, Mass. I would like to have a method pub-lished in The Metal Worker for obtaining the elevation and patterns of double or offset elbow, as indicated in the accompanying sketch. From A to B is 3 feet, and from C to D 3 feet 6 inches. The 15-inch pipes C D and C' B are to be connected by means of a double elbow, as indicated by the dotted lines DMC and CNB.

Answer.-In Fig. 2 is presented a duplicate of sketch submitted by our correspondent. To obtain the elevation of desired offset elbow proceed as follows: Bisect ed and Be' and draw E E. Divide E E' into four equal parts, as indicated by E F G F' E, and from points F and F erect the perpendiculars F H and F' H'. With H E as radius and H H' as centers strike the arcs ET G, G T E'. Divide the arcs into any odd number of parts, depending on how many pieces there are to be in the elbow. As the part of elbow above N M is to consist of four pieces, E T G and G T E' are each divided into seven equal parts. Prolong D d, C c and C' c' as shown, and through point I in E T G draw the line H J, extending it indefinitely. With H as center and H d as radius strike the arc Rd. From H and H' set off the distance R J, as shown by the same points as centers and with SQ dicated by JQ KP, LO, &c. Conss radius strike the arcs QPON and nect the points JKLM, QPON, &c.,

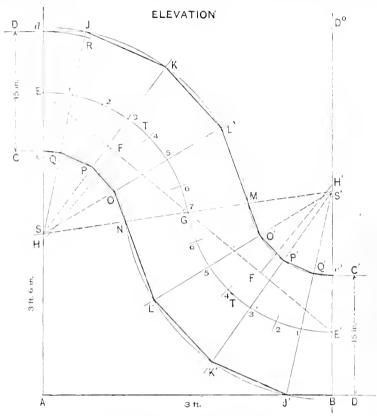

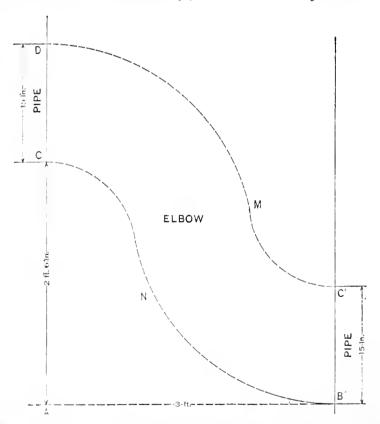

Fig. 2.-Method of Drawing the Elevation.

Elevation and Patterns of Offset Elbow.-Fig. 1.-Sketch Submitted by "W. H. E."

S H, H' S', and draw S S'. With S and | Q P' O' M. From S and S', through S' as certers and S J as radius strike points I, 3 and 5 in E T G T' E', draw the arcs J K L M and J' K' L' N. With the miter or joint lines of elbow, as in-

as shown. As but one section of elbow is necessary for use in obtaining the patterns the various sections may or may not be drawn, as desired.

In order that a confusion of lines may be avoided the method of obtaining the patterns for parts of elbow is shown in Fig. 3. To obtain the patterns shown proceed as follows: Opposite the arm of elbow, as indicated by DJQC, draw a whole or half profile, as may be found convenient. In the present instance the half profile is drawn as indicated by C U D. Divide the half profile into any number of equal parts, and, with the T-square placed at right angles to S D, and bringing the blade against the profile, drop corresponding lines upon the miter line QJ. Place the T-square so that the blade shall be parallel to J K, aud carry lines from the points in Q J, cutting P K as shown. For the pattern of arm DJQC, on C D extended lay off a stretchout of profile, as shown by V W, through the points in which draw the usual measuring lines. Place the T-square parallel to the stretchout line, and bringing it against the points in Q J, cut the corresponding measuring lines as shown. Then a line traced through these points of intersection, as shown by v b w, will be the pattern.

For the pattern of section J K P O

prolong the line S X, as shown by Y Z, and upon this line lay off a stretchout of the profile. Through the points thus obtained draw the usual measuring lines. Place the T-square at right angles to the section, or, what is the same, parallel to the stretchout line, bring it successively against the points in the miter lines J Q and P K, and cut measuring lines of corresponding

sirous of continuing in the employ of -, hereby agree in consideration of such employment and the agreements on the part of the employer hereinafter contained, that:

1. I will conduct myself as a gentleman in and about the business in which I am employed and toward my fellows.

2. I will perform my duties to the best of my ability and abide by the rules of the firm as from time to time adopted.

3. I will remain in employ of said - unless sooner discharged firm until or released in accordance with the con-

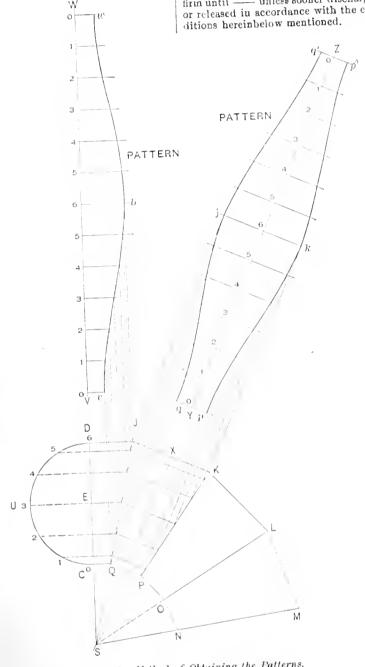

Fig. 3.—Method of Obtaining the Patterns.

Lines traced through the points thus obtained, as shown by  $q \neq q'$ and p k p', will form the desired patterr.

# A System of Wages Contracts.

An employer of labor in Chicago has caused to be published a form of wages contracts, which he introd ced in his manufactory some years since, and which he says has worked very satisfactorily. The form is as follows:

# Employee's Contract.

I, —, of the city of Chicago, residing at No. — street, being de-

4. I will leave 10 per cent. of my wages on deposit with my employer until such percentage so left amounts to the sum of — dollars, after which I am to draw all my wages excepting said deposit, upon which I am to receive interest at the rate of 6 per cent. per annum, unless said deposit is forfeited in accordance with the conditions hereinbelow stated.

5. I agree not to join in any strike or remain away from the shop of my em ployer during any strike of employees of any other establishment in the United States or of any employees of said firm, under penalty of forfeiting to said firm for its own use the sum deposited in accordance with Clause 4 of this agree-

ment, which sum shall be in full of all damages.

6. Lagree not to join or remain a member of any organization in which the obligations of members are such as would in any way prevent me from earrying out this agreement in good faith.

### Employer's Agreement.

1. The said firm agrees on its part to furnish employment to said employee until --, at the rate of --- dollars

per day of ten hours.
2. To pay to said employee, Monday of each week, all wages earned the preceding week, except the 10 per cent, to be retained in accordance with this agreement, above noted, clause four.

3. To pay to said employee at the expiration of this agreement all moneys due, including 6 per cent, interest upon all moneys retained in accordance with this agreement.

4. Said employer agrees not to discharge the said employee excepting for cause, and he shall be entitled to a written notice of such discharge one week preceding the date upon which employment shall cease.

5. Said employer agrees that he will release from this agreement said employee in case any contingency arises that in the judgment of the managers or superintendent of the department in which he is engaged is such as to justify said employee to a discharge.

6. Said employer agrees not to join or remain a member of any organization in which the obligations of members are such as would in any way prevent them from carrying out this agreement in good faith. It is mutually understood between the parties hereto that the object of the employee in entering into this contract is to obtain continuous remunerative employment, and upon the part of the employer to retain competent and reliable employees, upon whose services he can confidently rely. It is also mutually understood that 10 hours shall constitute a day's work; but said firm shall have the right, during seasons of dullness, to run upon short time, not less than 45 hours per week, and during such short time it shall only pay for the number of hours' service actually rendered.

Signed in duplicate at Chicago, this 

He further says: "It is not my practice to have contracts with all my men, but only with so many as I feel certain that I will be able to furnish work for. Hot headed men rarely strike unless they feel that the strike will be practi-cally unanimous, as 25 or 50 per cent. (which always includes the best men) forms a nucleus around which a perfect organization can be quickly effected. I have had no difficulty whatever in inducing men that I wanted to sign the contract, as it is considered fair. The deposit is required to place the men upon an equality with me in a financial way so far as the contract is concerned. The contracts are made to expire at different times during the year, so that comparatively few are expiring upon any given date. The men in the shop consider an offer of a contract as a compliment, and those not under contract look upon those who have them with some jealousy; but no trouble has arisen from this cause. It is a good thing for the men, as it teaches them that they can save money; and several of my men have paid for homes from their savings. The contract does not prohibit unions legitimate purposes; social advantages, life insurance and sick bene-

# ROOFING AND CORNICE.

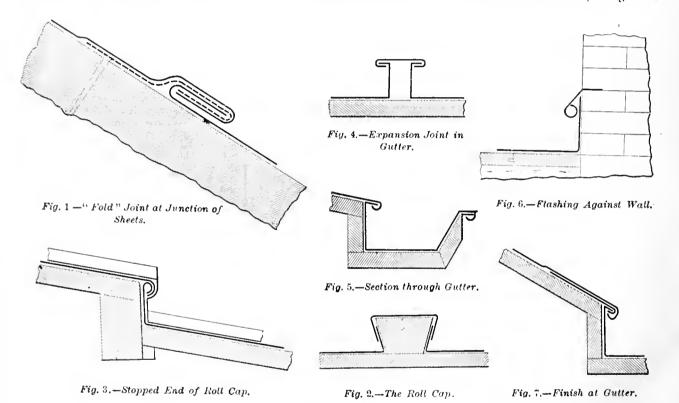

# Zinc Roofing Abroad.

At a late meeting of the Northern Architectural Association, held at New castle-on-Tyne, a paper on Zine and Zine Roofing was read by the secretary, Arthur B. Plummer, and published in full in the Building News of London. From that portion of the author's remarks relating to zine roofs we condense the following, and reproduce the sketches as shown:

Referring to some of the different systems of zinc roofing recommended by the Vieille Montagne Company and others, I would state that the roll cap system is laid on boarding, and

cap system, the section through a roll is somewhat of a wedge section, with the point of the wedge cut off (Fig. 2). The clips that pass under the wood rollers are about 2 inches wide and placed about 3 feet apart along the roll. The cap is secured by forked connections; these are pointed pieces of zinc, 2 inches or 3 inches long, by about 1 inch wide, one end of which is soldered to the inner surface of the cap on each side, the point being free as the cap slides into the roll. The points of these forks slip in under the hooked portion of the clip. The stopped end of the roll cap on the upper level of the drip is bent over with the edge of the

doubled back so as to form a bead, and also by a strlp of strong zinc nailed along the edge of the boarding over which the bead is turned (Fig. 7). The ridge cap can be covered by a zinc roll cap turned over it; this cap is strengthened on the lower edges by being bent round so as to form beads, and it is fixed with clips in the usual way (Fig. 8). The incline of zinc roofs constructed as before mentioned should be from, say, 20° to 30°, whereas for slates or tiles it is from 32° to 45°; consequently this system of roofing requires lighter framing and less brick work in the hight of chimneys, gables, &c., and there is also less surfarce to cover, owing to the

ZINC ROOFING ABROAD.-ILLUSTRATIONS ACCOMPANYING MR. PLUMMER'S PAPER.

on this boarding, at intervals of about 2 feet 10 inches or 2 feet 11 inches, center to center, wood fillets or rolls are fixed while the roofing is being laid. These run from ridge to caves. Roughly speaking, the sheets of zinc are laid between these rolls, with their edges turned up against the rolls and the edges and roll are then covered with a capping of zinc. If the roof has a fall of 1 foot in 8 feet, or upward, then only a welt or fold joint at the junction of the sheets is required (Fig. 1). In the case of flatter roofs, if possible a fall of 3 inches in 10 feet should be obtained; in such flat roofs, however, the drips should occur at about every 7 feet 6 inches. The drips should be 2½ inches deep and not less than 2 inches, to allow the rolls to pass under the projecting upper sheet. If laid with the drawn roll the drip will require to be 3½ inches deep. In the roll

sheet (Fig. 3). In gutters where the incline is very slight and soldered joints are therefore necessary, an extra allowance of play should be provided for expansion and contraction by placing a sort of roll system across the gutter at its highest points (Figs. 4 and 5). For guttera 1½ x 2 inch drips should be allowed, except where it is necessary to put a roll in the center, and in this case they must not be less than 2 inches.

### Flashings.

Wall flashings should go into the wall 1½ inches; they are very similar to lead and for strength to stiffen the edge, and for appearance, should be finished with a bead (Fig. 6), and pointed in cement. The edge of the sheet should be turned up about 6 inches against the wall. The upper edges of the sheets nearest the eaves are strengthened where they project over the gutter by being

lower pitch of roof. Zinc roofs also have zinc gutters and flashing 3, and the extra cost of auch lead work in ordinary roofs is thus saved. In cases of greater or less pitch than 20° to 36°, it is better, the Vieille Montagne Company say, to adopt the patent roll cap system. This is similar to the ordinary roll cap construction, excepting that there are differences in the shape of the wood roll, the roll cap and the clips. When zinc roofing is required to be laid not upon boarding, it is strengthened by corrugations. Ordinary corrugated zinc has the flutes about 3½ inches wide, and rests upon spars about 2 feet 6 inches apart. Zinc roofing thus constructed has the advantages of both strength and durability owing to the corrugation. I may perhaps also mention that the corrugation itself in great measure overcomes the difficulty of expansion and contraction—at any rate,

this is the case across the sheets in cor-It can be easily laid upon a rugation. light framework of wood or iron; it is unnecessary to have boarding. minimum incline of these roofs should be about 22°; the lap in the width of the sheets should be from 31 to 4 inches The sheets should not be riveted to gether; they can be sufficiently fixed with clips-that is to say, three slips of zinc are soldered to the underside of each sheet, and these book on to similar hooks fixed to the wood framing, or ther can hock on to iron purlins. The they can book on to iron purlins. corrugations are of three sizes-2# 3 and 315 inches, center to center. Patent corrugated zinc, with flat spaces between the corrugations, is another form of corrugation often preferred (Fig. 9).

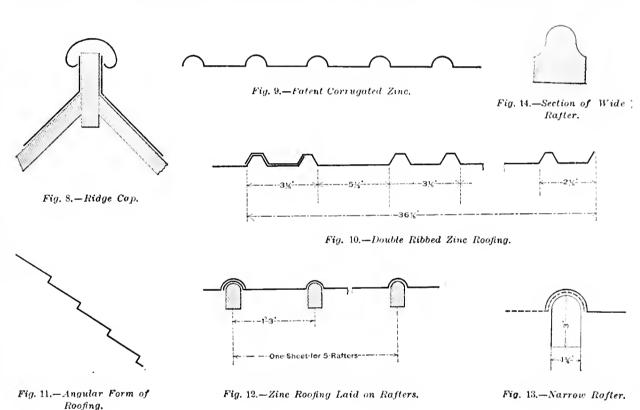

#### Double Ribbed Rooting.

Double ribbed zinc roofing may be laid on boarding or on laths or battens

those below them should be about 5 inches. The rafters rest upon purlins, which in large roofs (owing lightness of the system) may be 10 feet The depth of the rafters or rolls apart. should be about 3 inches when resting upon purlins 7 feet apart; but when laid upon boarding, 2 inches deep is enough. The wood rafter can be any depth and wi th; but 3 x 14 inches (Fig. 13) is large enough if the rafters are wider. Then the upper part to a depth of 11 inches must be worked to receive the corrugations of the metal (Fig. 14) The ridge roll is covered with z ac nearly in the same manner as with lead, except that the zinc is not worked so much into the angles under the roll, and it is secured on the underside by forks. Valley gutters are also formed in somewhat the same manner as with lead. For roofs laid with wood rolls, the wooden trough is lined with that paint does not readily adhere to sheet zinc unless it is first washed with one or other of the necessary solutions, or a thin coat of liquid size will make any oil color adhere to zinc should this be required for any purpose.

# National Iron Roofing Association.

The semi annual meeting of the National Iron Roofing Association was held at the Horlenden House, Cleveland, Wednesday of this week, August 15. Eleven concerns were represented at the meeting from the cities of Canton, Cincinnati, St. Louis, Cambridge, Chicago, Niles and Cleveland. The business transacted was of a routine nature and not of general interest. The Tariff

ZINC ROOFING ABROAD.—JLLUSTRATIONS ACCOMPANYING MR. PLUMMER'S PAPER.

(Fig. 10). The double ribs give extra rigidity to the sheets. The top of the sheets are nailed to the wood work under the overlap of the sheets above them, and the upper sheets are fixed with a forked connection on the inner face of the ribs. The length of the lap varies, according to the incline of the roof, from 2½ to 6 inches; the smaller the inclination, of course the longer is the lap, to avoid capillary attraction. Corrugated zinc may be laid like corrugated iron, with the flutes horizontal, so that the sheets will span wider spaces between principals without any intervening rafters or purlins. In such a case, however, the flutes must be of a peculiar angular stepped form (Fig. 11). In Italian corrugated zinc roofing the corrugations are 1 foot 3 inches center to center (Fig. 12) A great advantage is that it may be 1-id without boarding upon rafters spaced and shaped to fit into the corrugations, or it may be laid on boarding. The sheets are secured on boarding. The sheets are secured to the rafters by patent holding-down clips. The lap of the upper sheets over

sheet zinc, the sides of which are turned up, and the upper edges bent inward under the bead formed by the lower edge of the sheet at the eaves. When Italian corrugated zinc is used, the sides of the zinc lining to the gutters are turned up, and the edges bent over the thickness of the wood sides of the trough; the minimum fall of such gutters should be 1 in 40.

### Weight of Roofing.

The following is the approximate weight when laid, including corrugations and laps for 100 superficial feet: Square roll cap, 14 gauge, 144 pounds; Italian corrugation, 150 pounds; square roll cap, 16 gauge, 192 pounds; Italian corrugation, 198 pounds

corrugation, 198 pounds.

In the zinc tile system the tiles are generally fixed on boarding with clips or hooks, and are well adapted for high pitched roofs; they can be fixed with ease even by unskilled men. Each tile is hung from a hook fixed upon battens or boarding, and passing through a hole near the top of the tile. I may mention

Committee reported that it had been able to secure certain changes in the iron schedule, which it was expected would be of benefit to the trade.

### FLASHINGS.

NED. PIERCE, Bellows Falls, Vt., has secured the contract to slate the east wing of the Abensqui Machine Works of Westminster Station, Vt. He also has under way the slating of an addition to a school house in Marlboro, N. II.

THE GLOBE VENTILATOR COMPANY, Troy, N Y., have recently placed two 60-inch Globe ventilators on the Powers Hotel, at Richester, N. Y., to remove the heated air from its upper flors and render them more comfortable.

Schwing & Friswell, Bridgeport, Conn, have taken the contract to furnish the metal work on the new plant of the New York State Reformatory for Women at Bedford.

F. W. Stelling, Hartford, Conn., has the contract for the metal work on the new Belding House at Rockville, the New Hartford Town Hall, and the new Masonic Temple, Hartford.

THE WESTERN FOUNDRY COMPANY, Chicago, send us a copy of a catalogue which they have just issued, relating to roof creating, lawn furniture and stable fixtures. The illustrations are numerous and cover the leading specialties turned out by the company. In their announcement to the trade they state that they enjoy exceptional facilities for the manufacture of light gray iron castings and that they make patterns in wood, iron and brass, employing only skilled workmen. In their foundry they give employment to 100 molders, and make use of the best grades of iron and other material. They make a specialty of difficult cored work and also do coppering, japanning, polishing and nickel plating.

The Et. Paul Roofing and Cornice Works, Wabasha and Bridge streets, St. Paul, Minn., are now doing considerable work on school and court houses and other public buildings at various points throughout the Northwest. Advantage is being taken by co-operate authorities of the prevailing low prices for material and labor, in making improvements which have long been needed. The general demand is considerably lighter than in former years and has started up a little later in the season. Rock-faced steel siding is doing better than almost any other product of the factory. Shipments have recently been made as far east as Philadclphia and some points in New Jersey.

The Tunnbull & Cullerton Roofing and Metal Lath Company, 195 La Salle street, Chicago, have issued a catalogue illustrating and describing their sheet steel lath and Monarch fireproof partition, ceiling and floor construction. The catalogue comprises 48 pages and contains cuts of the lath and illustrations of its use in making partitions, floors and ceilings, together with views of numerous large buildings in Chicago in which this construction has been used. A. Feist & Co., Occidental Hotel, San Francisco, are agents on the Pactfic coast.

E. E. Noves, 584 West Lake street, Chicago, is to furnish the gutters, tin roofing, conductors and ventilating skylights for the large new factory of Norton Bros., Maywood, Ill.

Among the contracts recently taken by R. Hughes, 359-361 West Lake street, Chlesgo, can be mentioned the following: Steel ceiling and wainscoting for store of C. Bertrand, Ashland avenue and West Lake street; corrugated iron roof for distillery storehouse of M. Morris, Riverside, Ill.

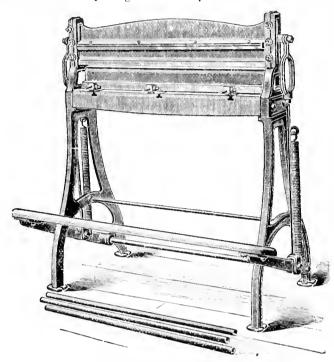

# Niagara Patent Tube Former.

The accompanying cut shows a machine for forming tubes of sheet metal recently put on the market by the Niagara Stamplog & Tool Company, Buffalo, N. Y. The work is done in a novel manner, and a patent has been granted on the method as well as on the machine. The special feature of this machine is that it does away with the manufacture of small tubes, to which the great objection was that in tubes of small diameter and considerable length

the mandrel would spring. The machine made by the Niagara Stamping & Tool Company, however, acts in a different way, the blank being curied between a punch and a dle. The machine represented is suitable for making tubes up to 86 inches in length and 1 inch in diameter, machines of other sizes being furnished to order, and by using a machine sizes being a machine sizes being furnished to order, and by using a machine sizes being furnished to order, and by using a machine sizes being furnished to order.

is affected by heat and cold and expands and contracts according to the temperature of the room in which it is placed. A cord running over pulleys connects the plaque with the regulator at the ash pit.

The new regulator is connected directly with both the chimney and the ash pit and consists of two slotted cyl-

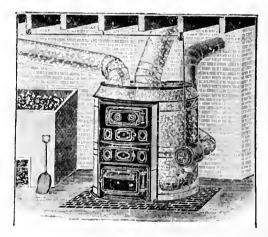

Niagara Patent Tube Former.

chine of sufficient strength tubes can be made of exceptionally heavy material. The work is done by means of a foot treadle, leaving the operator with both hands free, three movements being required to complete the tube. The working parts in the machine provide for the three steps required to shape the tube, so that the work is finished at one handling. The parts can be quickly removed and replaced with others for tubes of different diameters. The seam can be made either lap or butt seam.

### The New Howard Thermostat.

In the illustration herewith we show in connection with a hot air furnace inders separated by a diaphragm working alternately, one to increase and the other to check the fire. When an increased heat is necessary to secure the temperature at which it is set to maintain, the front cylinder is opened and air drawn down in from the cellar to supply the fire. When the temperature reaches the top limit this cylinder is closed, shutting off the air from the fire and the other cylinder opened. This concentrates the draft of the chimney on the ash pit, exhausting the air from it to supply the chimney and prevents the air that may leak into the ash pit from entering the fire to make it burn. By this means the draft of the chimney is effectually disposed of and the fire left in a state of very slow combustion.

The New Howard Thermostat.

the new thermostat made by the Howard Thermostat Company, Syracuse, N. Y. This thermostat is operated by the same highly polished nickle trimmed plaque as has been formerly used. The plaque moves the slotted cylinder as it

This new feature is said to greatly increase the efficiency of the thermostat. It is said to work equally well in connection with a steam or hot water heating apparatus and can be attached to any apparatus by a good workman.

## New Publications.

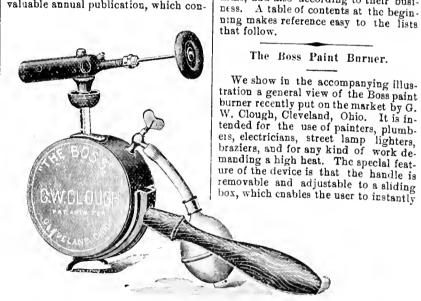

KITCHEN BOILER CONNECTIONS. A Selection of Practical Letters and Articles Relating to Water Backs and Range Boilers. Compiled from *The Metal Worker*. Size 6 x 9 inches; 129 pages; bound in cloth. Published by David Williams, 96-102 Reade street, New York. 1894. Price \$1.

The title page of this volume clearly indicates the scope of its contents. It is a work that has been called forth more especially by the demands of the plumbing and heating trade. For many years past the correspondents of The Metal Worker have frequently asked questions concerning kitchen boilers, and these inquiries have covered the widest range of topics related to this one subject. From the mass of valuable material that has been accumulating in our columns we have selected the articles of greatest interest and have edited and added to them in compiling this volume. In addition to the reprinting of the inquiries and answers as they appeared in The Metal Worker, we have also added introductory sections, and, where neces-sary, have prepared short articles on the different topics so as to make the treatment of the subject complete. The book is divided into two parts: the first on Water Backs and Boilers and Their Connections, and the second on Heating Rooms from Range Boilers. A good idea of the scope of the work may be gathered from the 11 chapter headings, which are as follows: Water Backs and Their Connections; Boiler Construction, Operation and Connections; Circulating Pipe; Multiple Connections; Double Boilers; Difficulties Met with in Everyday Practice; Relief Pipe and Vacuum Valve; Horizontal Boilers; Miscellancous; Heating Room from Kitchen Boiler; Radiators Heated from Coils in Stoves. The table of contents gives all the different articles in the book, while at the back is a full alphabetical index, so that no difficulty will be experienced in referring to any topic which is treated. The book is well printed, and engravings are found on nearly every page clearly illustrating the different subjects. We believe the work will meet the needs of a great many readers who have been puzzled with the curious action that sometimes takes place in water back

connections, and it will also be of assistance to those who have had but little experience in the work of setting range boilers.

HENDRICKS' ARCHITECTS AND BUILDERS'
GUIDE AND CONTRACTORS' DIRECTORY
OF AMERICA, 1894-95. Size 8 x 10 inches;
709 pages. Published by Samuel E.

85.

We are in receipt of a copy of this valuable annual publication, which con-

The Boss Paint Burner.

tains such serviceable lists of builders, contractors, manufacturers and dealers in all kinds of building supplies. It aims to be a complete directory of all the construction industrics of the country, and contains over 170,000 names, addresses and business classifications, comprising builders and contractors of material and construction in the building and kindred industries. While aiming primarily to be a list of architects and builders, the names include many other manufacturers and dealers in goods pertaining to building. There are, for instance, the names of over 9000 plumbers, gas and ateam fitters; over 2000 steam and hot water heating contractors; 2000 hot air furnace dealers; nearly 5000 roofers;

adjust it to any desired angle within the limits of the sliding box. The operator is not thus under the necessity of placing himself in an uncomfortable position when compelled to work in difficult situations. The manufacturer also alludes to the use of this device in drawing the temper of lathe tools, drills, &c., and of its serviceableness in the machine shop and in the factory for forging light drills, &c.

755 galvanized iron cornice makers; 518

dealers in wrought iron pipes and fittings; 525 dealers in plumbers', gas and

steam fitters' supplies. There are likewise lists of hot air furnace manufact-

urers, galvanizing works, gas heating and cook stove manufacturers, bath

heater makers, manufacturers of combination heaters, &c. The book is arranged alphabetically and is classified both according to the location of the

firms, and also according to their busi-

Verplank Colvin of Albany continues to urge the building of ship canals by the Eric to Oswego, N. Y., maintaining the present barge channel to Buffalo, and also a ship canal on the Champlain St. Lawrence route.

# STEAM AND HOT WATER.

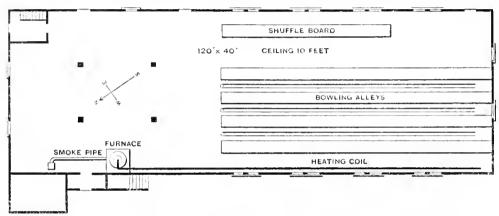

### A Combination System.

After experiencing some difficulty in warming the clubhouse of the South Orange Field Club, at South Orange, N. J, the heating plant illustrated in Figs. 1 and 2 was installed by W. B. Wilkinson of the New York office of the Howard Furnace Company of Syracuse, N Y. The plant has been operated during the past winter, giving supply, is located near the northern end of the building. In the center of the cone top is an opening more than 30 inches in diameter to provide an ample circulation of air through the heater. Owing to the length of the building hot air was not relied on to do the entire heating, as it would have been difficult to secure a flow of warm air to the lower end. A supplementary hot water system was employed, consisting I street, New York, are issuing a 12-page

temperature greatly in excess of what is ordinarily found in hot water heating plants, which fact is referred to as largely accounting for the success attained in warming so large a space with so little heating surface.

#### HEATING NOTES.

of a 2 inch flow pipe taken from the top of a U-shaped coil, and running on an incline to the lower end of the bowling alley, where an air cock was placed, the main dropping down and connect ing with a manifold heating coil composed of 386 lineal feet of 11 inch pipc. The return from the coil was carried back to the furnace below the line of the grate, where it ascended and connected with the return end of the U shaped heating coil. At the point where the return ran over to the coil a tee was placed, to which was attached a pipe running over to and connecting with another tee, one end of which connected with the pipe from the city water main, a stop cock being placed on the supply pipe. From the other end of the tee the pipe ascended to an

catalogue of their Sunbeam steam and hot water boiler. The pamphlet has a brown cover on which their address and "Summer heat for winter homes" are arranged in a gilt design. The title page shows their trade mark of the sun rising out of the sea. Then come a description and sectional view of their boiler, which is subjected to a cold water test of 150 pounds before shipment. The boiler is made in six a zes, Nos. 1, 2, 3, 4, 5 and 6, with grates having an area respectively of  $1\frac{1}{2}$ , 2,  $2\frac{1}{3}$ ,  $3\frac{1}{4}$ , 4 and  $4\frac{\pi}{6}$  square feet, and rated to carry 233, 400, 600, 800, 1000 and 1200 square feet of direct radiation. The last page is devoted to the Eagle brand adjustable elbow and to black and galvanized iron smoke stacks.

THE HEATING AND VENTILATING DE-

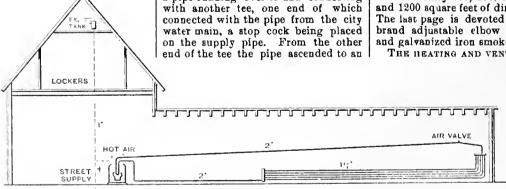

Fig. 2.-Sectional Elevation.

ceiling on the first floor is 10 feet. The building is of wood, and was not erected with the idea of making it an easy one to heat, ample opportunity being afforded for the entrance of air. In addition to this, large windows on each aide of the extension, which is used as a bowling alley, increase the difficulty of heating. A No. 48 Howard furnace, fitted with a galvanized iron casing, perforated with a number of 9inch holes around the base for fresh air

attic over the dressing room on the second floor, where it connected with a 15 gallon closed tank provided with a asíety valve at the top. The city is supplied with water at a pressure of 110 pounds, and the heating plant works under a slightly higher pressure, and after being filled the stop cock is turned off and the safety valve set to open at a pressure of 120 pounds Under this pressure the flow mater and upper pipes of the heating coll are brought to a

PARTMENT of the Smith & Anthony Company, Boston, is ably managed by W. M. Barber, and dealers will find few houses impossible to heat by the use of the Hub system and hot water apparatus. The company have made a special study of school house heating and ventilation and have prepared plans for some recently erected buildings.

CIRCULARS ISSUED under date of August 1 by the Ideal Boiler Company, Chicago, Ill., inform the trade that the Ideal steam boilers will, they expect, be ready for the market within 30 days.

McMann & Taylon, 42 Cliff street, New York, are sending out a little clrcular of their red rustless cement for the use of pipe fitters. It is said that it does not harden in the can like red lead and contains no poison. It is put up in cans and is always ready for use.

THE NEW JERSEY HEATING & MFG. COMPANY, 36 Mechanic street, Newark, N. J., speak very highly of the Gorton boilers they have set in engine houses for heating the buildings and keeping up ateam in the fire engines.

# The Little Giant Steam Heater.

Giblin & Co., Utica, N. Y., have just put on the market the Little Giant

boiler. The Little Giant steam boilers are made in three sizes: hight 41, 45 and 49 inches; diameters of fire pots 15, 20 and 24 inches, and adapted to supply 150, 215 and 300 square feet of direct radiation.

### Old Saws and Modern Instances.

"Nothing is lost if you know where it is." This applies to atock and time, which only show on the customer's account.

Little Giant Steam Heater.

steam heater, a broken view of which is shown in the accompanying illustration. It is put out to meet the demand for a low cost steam boiler, and it is made on the model of the Little Giant hot water boiler, manufactured by the same firm. It is similar in construction to the hot water heater except it has a larger chamber for steam. The manufacturers point out that the boiler will be available for heating small houses, and even those of reasonably large size, with steam. The vertical construction is alluded to as securing quick circulation and rapid generation of steam. In the illustration an improvement in the Little Giant boiler is shown in the clinker door over the grate, by means of which the clinkers, &c., can be drawn from the fire over the grate.

This device also secures for the boiler an additional depth of about 3 inches on each side of fire pot; thus, it is pointed out, increasing the body of the fire and the heating capacity of the

UNCLE JOE.

Capt. W. Schlemick of the oil tank steamer "Standard" has informed the Hydrographic Office that he picked up, July 13, in Colough Bay, County Cork. Ireland, a "bottle paper" which had been thrown overboard February 11 last in latitude 48° 50', longitude 23° 30'. It was in a bottle sent out by the Hydrographic Office for the purpose of experimenting with ocean currents, and had traveled 660 miles in 152 days.

The Government crop report issued on last week gave the condition of corn on August 1 at 69.01, against 95 on July 1 this year, and 87 on Au-

gust 1 last year. The condition of spring wheat was 68.04, against 67 a year ago.

### SCRAP.

RITER BROTHERS & Co., Philadelphia, importers and dealers in tin platea and metals, have dissolved partnership, Robert Pearce, Jr., retiring. Charles J. Riter and Michael M. Riter, Jr., will continue the business as Riter Brothers & Co., at their present quarters, 1022 Race street.

Almost the entire plant of the Etna-Standard Iron & Steel Company, Bridgeport, Ohio, is in full operation. This concern have recently extended their list of manufactures, and they are now prepared to furnish to the trade promptly black sheets, tin and terne plate, bars, light structural shapes, small rails and specialties for the roofing and building trades.

THE LEECHBURG FOUNDRY & MACHINE COMPANY Of Pittsburgh, builders of rolling mill and tin plate machinery, have just secured a contract for the cntire equipment of the new plant now under erection by the Morton Tin Plate Company, at Cambridge, Ohio, for the manufacture of black sheets for tinning purposes. Included in the order are three hot mills with 24 x 32 inch rolls, three cold rolling mills with 20 x 32 inch rolls and three 36 inch doubling shears with engine attached, two 36inch vertical squaring shears, one Mosta patent pickling machine and roll lathe capable of turning 24-inch chilled rolls. The hot mills will be driven by a 32 x 60 inch Hamilton-Corllssengine, coupled direct, while the cold rolling mills will be driven by a 24 x 48 inch engine of the same type, coupled direct, both being furnished by the Hoover, Owens & Rentschler Company of Hamilton, Ohio. The buildings will be all iron, the main building being 60 x 200 feet in size, with two leants. The whole in size, with two leantos. The whole plant will be so arranged that it can be extended to six mills, and will be under the management of Ambrose Beard. The capacity of the plant at the atart will be 400 boxes of finished black sheets for tinning purposes every 24 hours. It is the intention of the Morton Tin Plate Company to add a dip-ping department to the plant in the near future.

THE BLACK DIAMOND TIN PLATE WORKS, Laurel street, Philadelphia, operated by Hy. W. Scattergood, are very busy on orders for Black Diamond, Arrow, Quaker City, Horse Shoe, Imperial and Peerless bright plates, and Black Diamond, Quaker City, Horse Shoe, Arrow and Laurel terne plates. Three pots are kept busy, and with a new pot about completed the production of these works will be about 1000 boxes per week. The new pot is built after ideas of Mr. Scattergood and others, and, it is said, embodies some important improvements. Upward of 40 hands are at present finding steady employment at these works.

At Kansas City on August 8 the lower grades of wheat were offered at 30 cents to 35 cents per bushel, at least 20 cents lower than corn. "A bushel of wheat will produce 15 pounds of meat, while a bushel of corn will produce but 10. Hence farmers are feeding wheat to their stock, which sells low, and marketing corn, which brings a high price." It is estimated that wheat thus converted into meat will bring about 60 cents per bushel.

# PLUMBING and GAS FITTING.

The Master Plumbers' Association of Rhode Island.

Fifty master plumbers of Rhode Island and a number of guests met at the Continental Steamboat Company's wharf, Providence, for a short sail down Narragansett Bay to Crescent Park, on August 9. Samuel Jackson and his Committee on Reception, Messra. Tierney, Brennan and Manney, were on hand as early as nine o'clock to receive visitors and members. There were present:

John F. Deedy, National State vice-

president of Massachusetts.

J. Warren French, president of the Boston Master Plumbers' Association. Jas. F. Davlin, Boston.

W. Emmet Crosby, national execu-

tive clerk.

A. A. McLsughlin, Worcester. P. Tierney, Providence. S. Jackson, Providence. Jas. C. Conroy, Providence. F. G Fales, Providence. Thos. Phillips, Providence. P. Mean, Providence. J. B. Manchester, Providence. Mr. Lally, Providence. J. Graham, Providence. W. Congdon, Providence. W. Mitner, Providence. Jno. Shanley, Providence. Walter Manser, Providence. Wm. F. Heck, Providence. L. P. Carey, Providence. F. C Carey, Providence. John E. Evans, Providence. Geo. Evans, Providence. C. B. Brennan, Providence. H. S. Root, Providence. A. F. Rosseter, Providence. L. C. Swenson, Providence.

D. Myers, Providence.
J. Manning, Providence.
T. Smith, Providence.
J. B. Morrisy, Providence.
W. S. Whipple, Providence.
Thos. Marion, Providence.
Jas. F. Mulvey, Woonsocket.
Jas. Openshaw, Newport.
Jos. Haire, Newport.
M. Butler, Newport.
P. J. Murphy, Newport.
R. L. Steil, Newport.
John Cremin, Newport.
A. L. Oman, Newport.

David Fales, Pawtucket.

J. McCahey, Pawtucket.

Owen McPartland, Pawtucket.

Thos. Marion, Pawtucket.

John McCaims, Pawtucket.

John McCaima, Pawtucket. H. L. Borden, Pawtucket. On arriving at Crescent Park the

On arriving at Crescent Park the party immediately proceeded to one of the private halls and Mr. Jackson called the meeting to order and appointed Owen McPartland sergeant-at-arms. Letters of regret were received from John Mitchell, David Smith, Boston; Geo. Mahl, Hartford; John W. Green, Worcester; Jas. Ahern, Hartford; A. J. Clerkin, New Haven; J. B. Wirsnt, New Britsin.

Thos. Phillips received a vote of the later of the service of the later of the late

Thos. Phillips received a vote of thanks for his able report as State delegate of the Detroit convention. The convention went into executive session, which lasted several hours. Later the delegates and guests were

served with a fine dinner. Jas. C. Conroy read a paper which "hit" a large number of prominent master plumbers, and as each one received his "notice" a burst of merriment followed.

Reports showed the association to be in a very presperous condition. The Legislative Committee is preparing a bill to regulate plumbing in the State. The large attendance and business enthusiasm is an example for other States to follow.

#### Water Closet Seats.

With the advent of the earthenware water closets now in general use came flush tanks and seats for use in connection with them. Naturally these being of a different material were made by another set of manufacturers, and some strife to secure trade resulted. Seats of various shapes, methods of fasten-ing, kinds of wood and styles of finish and flush tanks to correspond were made by each manufacturer. To keep an assortment a plumbing supply house required considerable warehouse space, without yet having a sufficient stock of any one style to fill more than one large order. No little difficulty is found at times in matching parts when necessary, and the plumber has lost considerable time in the effort. A step is now being made by some closet manufacturers to arrange for a seat of a standard size, to be used with all of their closets, and the various kinds of closets are being made with a place for attaching the seat that will be uniform throughout the line. By this means much less warehouse space will be necessary, and little difficulty will be found in getting a new seat when necessary. Flush tanks of a suitable style can be adopted in connection, and a saving of considerable expense and trouble will result, without the slightest reduction in sales.

# Master Plumbers of Mon-

In response to a call from State Vice. President John Hickman of Paterson, Monmouth County, N. J., were at the Monmouth Trust Company Building at Asbury Park, N. J., August 10, for the purpose of organizing a Master Plumbore, Association of the purpose of organizing a Master Plumbore, Association ers' Association. Among the guests were John Mitchell, president of the National Association of Master Plumbers, and Edward Murphy from New York, both of whom made speeches on organization, and Secretary McNabb of Paterson, N. J.; President Elias Berla, who made a humorous speech, and ex-Secretary Alexander Don of Newsrk, N. J. The meeting was called to order by the State vice-president and the routine of organization proceeded without difficulty, 32 members being enrolled and arrangements made to affiliate with the National Association. The officers elected are president, James Borham, Long Branch; vice-president, F. Brown, Asbury Park; secretary, B. Crowell, Asbury Park, and treasurer,

John Flitcroft, Ocean Grove; financial secretary, Wm. McMahon, Red Bank. After the meeting refreshments were served, during which many speeches were made and the affair was voted one of the pleasant experiences which come the way of the plumber. The association embraces the entire trade with but few exceptions and is regarded as a strong one. They will lend their aid in organizing other associations in the State.

### TRAPS AND VENTS.

The "Proceedings of the Twelfth Annual Convention of the National Association of Master Plumbers" are out this week. The early publication is due to the promptness of President Mitchell and his clerk. Copies will be sent to all members by mail, and any one not receiving a copy must blame his local secretary, who has not sent to the national office names of all members. Members who have been thus omitted will receive copies by writing to President John Mitchell, 113 Hudson street, New York.

W. EMMET CROSDY, executive clerk of the National Association of Master Plumbers, is in Boston on National Association business. En route he stopped over at Provider ce to attend the annual outing of the Rhode Island Master Plumbers' Association, and then went up to Worcester to be with them on an excursion to Quinsigamond Lske.

M. J. REDMOND & Co, Wallingford, Conn., have recently made improvements on the drinking founts in at the corner of Center and Main streets, at their own expense, for the public benefit.

ALEXANDER DON, representing the hot water and steam department of DuBois & Darrow of this city, attended the organization of the Master Plumbers Association of Monmouth County, N. J., last week, at Asbury Park.

MURHEAD & MURHARD, plumbers and dealers in plumbers' supplies, at Portland, Ore., find a lively appreciation among their trade of the Perfect gas controller as a gas saver. They have set a number in their city and recently placed an order for two to be used in connection with 100-light meters on a 2 inch service pipe.

MANAGER BROWNHILL of the Instantaneous Water Heating Company, New York, shows a letter to visiting plumbers from E. J. Kraber & Son, York, Pa., commending the Acme water heater for supplying hot water where there is no fire in the house to heat the kitchen boiler.

Since our last visit to the Henry McShane Mfg. Company, 625 Sixth avenue, New York, manager Murray has made some very attractive changes in the reception room and showrooms. A handsome ensmeled Roman bath, bearing a beautiful ses scene, in the show window gives the visitor some idea of what may be expected inside. The reception room is ornsmented in keeping with the goods displayed, one of the

choicest decorations being a life size portrait in oil of Henry McShane. At one side a row of Italian marble lavatories is used to display various atyles of bash fixtures, cocks, traps, legs and brackets, all in full nickel. On the other side, at the center, is a full size enameled bath in which is painted a bathing scene and over which is a full nickel plated shower and needle bath with rubber curtain. At one end is a Mexican onyx lavatory, the back piece extending up and forming a frame for a French plate mirror. The onyx in this lavatory is very beautiful in its markings, which are deep pink in color. Beside the lavatory is a Sitz bath with all of the necessary fixtures. At the other end of the tub is one of the new Star siphon water closets, gilded on the bss-relief ornamentation. Above this is a new porcelain flush tank, decorated in the same way, making a very handsome outfit. Should the visitor appear on a stormy day a white porce-lain umbrella "vawse" of the same handsome style awaita the dripping umbrella. Having met one of the courteous salesmen, the main showroom with the baths and lavatories in various marblea, and water closets of all styles, are shown, the blue and gold and Tennessee marble bathrooms with their luxurious fittings, and the room in which lavatory bowls of every descrip tion fresco the walls and give hints to the buyer. Some of their new things of special interest are the Star siphon closet, the Baltimore siphon closet, which has a cast iron trap and support for an earthenware bowl, designed for tenement houses; the Morris slow closing siphon valve for flush tanks, and the Morris pressure regulator for reducing the pressure in the house when the street pressure is high.

THE INSTANTANEOUS WATER HEATING COMPANY, 838 Broadway, New York, recently sent six of their Acme water heaters to the J. L. Mott Iron Works, to fill an order from Cuba.

THE D'Este & Seeley Company, 29-33 Haverhill street, Boston, Masa are the New England agents for the Henry Huber sanitary goods, which are attractively arranged around the tiled walls of their extensive sample room, a varied line of water closets and lava torles being shown. A large line of bathtubs, from the steel clad to the white porcelain goods of English manufacture, are shown. This house, in addition, handles everything in the plumbers' supply line, brass goods and lead.

The show windows at 838 Broadway, N. Y., attract no little attention these days. In the south window all kinds of gas cooking and heating stoves and appliances are so arranged that the utility of each is apparent and wonder aroused as to how so much can be shown in so little apace, which is a secret of W. M. Crane & Co. In the north window the Instantaneous Water Heating Company display an Acme water heater in full operation, with thermometers showing water running into the heater at a temperature of 70° and flowing from it at the rate of 1½ gallons per minute, at a temperature of 140°. When run to supply water at a bath temperature it will supply 2½ gallons per minute, at a temperature of 100°. These water heaters are meeting an increased demand this year, and are being largely used by plumbers. A shipment of them has recently been made to England, where there are at least 25 manufacturers of apparatus for the same purpose. Beside the water

heater in this window the Brownhill Company show the effect of their Perfect gas controller, showing two fixtures, each with three gas jets burning, one without and one with the controller attachment. The gas used by each set of lights passes through a meter having an 8 inch dial, and one circuit of the dial hand is made on the consumption of ½ cubic foot of gas. The three jets on which the street pressure acts directly each burn from 6 to 9 feet of gas per hour, as the pressure varies during the day and evening from 18 to 30 tenths. The other three jets give a more regular flame and stronger light and burn but 4% feet each per hour, as the Perfect controller keeps the pressure on them regular. These two windows show much that can be turned to profit by the plumber.

JAMES S. DELANEY, who had resided in East Cambridge, Mass., during the past 30 years, died at his residence, 33 Winter street, last week, aged 57 years. He was well known in Boston, where he worked as a master plumber 25 years, having his place of business at the corner of Cambridge and Stanlford streets.

THE GLAUBER BRASS MFO. COMPANY of Cleveland, Ohio, have recently placed upon the market a complete line of fuller work of superior quality, claiming several important points of improvement in the construction of same. They say the goods are sold at prices that will permit them to be used in contracts as well as in custom jobs.

JOHN MCVEY of basin clamp fame removed his plumbing shop from the Metropolitan Block into one of Wheat Jackson's rooms, on East High street, Lima, Ohio.

THE FIRM OF WHITE & HUNT, Trenton, N J., plumbers, have dissolved partnership. The settlement of the firm's accounts will be made by Mr. White.

James Bolan & Co.. Dayton, Ohio, were authorized as plumbers in connection with the sanitary system of sewers and their bond in the sum of \$3000 was approved. The license is granted from date to January 1, 1896.

J F. CONRAN visited the plumbing trade in New York this week in the interest of the Standard Mfg. Company, Pittsburgh, Pa., and placed orders for enameled roll rim baths, Sitz baths and other enameled sanitary cast iron goods.

THE PLUMNERS of Marlboro, Mass., were registered by the Board of Health last week.

THE LOWELL HEATING & PLUMBING COMPANY, Lowell, Mass., have gotten into new quarters at 828 and 836 Middlesex street, and have added copperamithing as a branch of their business.

We are indebted to Peck Brothers & Company, New Haven, Conn., for Supplement No. 1 to their catalogue for 1893, relating to their Pneumatic Siphon water closets (Wells patents). The publication, gotten up in the elaborate atyle in which the advertising matter of this well-known concern is issued, is a pamphlet measuring 9½ x 11½ inches in size, which gives ample room for the display of the handsome cuts. There are 38 pages, illustrating nearly as many atyles of closets. It begins with sectional views of their Pneumatic siphon closets and accompanying text explaining their operation thoroughly, a few aentences are ad-

dressed to the architect and the plumber, and directions are given for setting the closet. Next is an account of the tanks for these closets, and another page is given up to the subject of closet seats. Then comes the catalogue proper, the closets shown being the Glencoe, in 4 styles; the Atlas in 6 styles; the Monitor in 12 styles; the Marvel in 6 styles; the Dorado in 6 styles. Descriptive particulars are presented, and prices of the different closets are given.

WE ARE informed by Alexander Don of Newark, N. J., that the plumbers of Union County, N. J., have all signed a call for a meeting for the purpose of organizing a master plumbers' association. The place and date of the meeting are yet to be decided, but it will probably be held some time next week.

C. W. TALCOTT, Rumford Falls, Maine, has built an addition to his plumbing shop, which increases it about three times the size of the old one.

A. N. Pasman, John W. Calvert and Valentine Werner have each been granted a plumber's license at Jersey City, N. J.

THE FOLLOWING Board of Examiners have been chosen under the plumbing act for Brockton, Mass.: Dr. F. J. Ripley, Superintendent Mitchell of the Public Property Department and T. J. Kisney. Hereafter any plumber beginning business in the city must pass a satisfactory examination.

A TEST CASE of the plumbing ordinance of Brockton, Mass., is now bafore the court. The offender failed to file plans and properly test some work done.

THERE is a prominently displayed plumber's sign in Williamsbridge, N. Y., which conveys the information that the plumber is "licensed to connect water."

A SPECIAL MEETING of the Council of Toledo, Ohio, has been called to look into the matter of properly repaving streets opened to make water and gas connections. Carelessness is charged against those who do such work, which is resented.

The few railroad earnings thus far reported for August show a considerable decrease, and it is necessary to bear in mind that the earnings in August of last year were \$6,344,000, or 13 per cent. less than in the same month of 1892. The July returns compiled by The Financial Chronicle cover 96,757 miles, and show a loss of \$7,988.645, or 20.49 per cent., although in June of last year the decrease on about the same mileage was \$1,765,527, or more than 4 per cent. Some allowance must be made for the fact that business last year was awelled by the World's Fair, but the shrinkage is nevertheless remarkably large.

The condition of cotton on August 1 is given as 91 8, an increase of 2.2 points over the July condition and 3.5 over that of June, the condition of June and July being respectively 88.3 and 89.6. The condition on August 1, 1893, was 80.4, or 11.4 points lower than the condition for the same date this year. The averages by States are: Virginia, 96; North Carolina, 95; Georgia, 85, Florida, 93; Alabama, 94; Mississippi, 97; Louisiana, 96; Texas, 85: Arkansas, 96; Tennessee, 94; Missouri, 96; Oklahoma, 93.

# HEATING DO PLUMBING.

### NEW WORK AND CONTRACTS.

A NEW heating apparatus is to be provided for the Franklin engine house at Scranton, Pa. It will be a steam plant and will be so arranged that connections can be made directly with the steamer, preventing the apparatus from freezing up and keeping the water at a high temperature continually. Contract has not been let.

THE WORK on the steam heating and plumbing for the deaf and dumb school at Morganton, N. C., is progressing very satisfactorlly. J. C. Brewster of Raleigh, the contractor, is now there making arrangements for setting the boilers, putting in the radiators, &c.

T. C. MILLARD will erect at Danbury, Conn., a residence that will be 40 x 56 feet, having a plumbing system and a steam heating plant.

ROACH & MCGUIRE, New London, Conn., have just completed the plumbing of the 12 Bartlett cottages on Fisher's Island.

J. DONOVAN, JR, is building a threestory business block, at South Norwalk, Conn., for which he will want a steam heating plant.

THE ARNOLD COMPANY, New Haven, Conn., have taken the contract for the plumbing of the new house which Contractors Clark & Thompson are building on Kensington street.

- E. D. BARTHOLEMEW, Mauch Chunk, Pa., has the contract for a steam heating plant in the Odd Fellows' Hall, at that place, and will use one of the Thatcher Furnace Company Champion boilers.
- C. W. CLIFFORD, Trenton, N. J., has ordered four Volunteer boilers of DuBois & Darrow, New York, for heating contracts which he has closed.
- I. C. Shumway is doing the plumbing in the hotel building at Seventy-second street, on the Boulevard, New York, using the New York siphon closet of the Henry McShane Mfg. Company, 625 Sixth avenue, New York.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C, until September 6, for the plumbing, gas piping and electric wire conduits for the United States Post Office, Court House. &c., Building at Charleston, S. C. Drawings and specifications may be obtained from the supervising architect, Washington, or from the superintendent at Charleston, S. C.

THE SCHOOL BOARD closed a contract with W. H. Crawford of Oshkosh, Wis., to furnish the steam heating apparatus for the Oshkosh Normal School.

THE SCHOOL BOARD of Covington, Ky., are considering a new heating plant for the Third District School Building.

Specifications have been prepared for the heating and lighting of the new City Hall at Paterson, N. J., and estimates for the work are now being prepared to be handed in by Scptember 5, when they are to be opened.

ISAAC COFFIN & Co, Everett, Mass., are placing their hot water heaters in the new houses of Franklin Pierce, Hampshire street, and E. M. Hall, High street. The firm have also the contracts for the heating and ventilat-

ing apparatus in the new high school at Winchester.

THE METAL WORKER.

JOHN C. STEWART and Thomas F. Savage bid \$8675 and were awarded the contract for heating and ventilating the High School Building, at Los Ange'es, Cal.

SPECIFICATIONS for heating the Webster School by steam were read and adopted by the School Board of St. Louis, Mo., at its last meeting, and the secretary was instructed to advertise for bids.

THE CONTRACT for heating and ventilating the Lincoln School Building, at Oskaloosa, Iowa, was awarded to Warren Johnson at \$989.

THOMAS F. HETHERTON bid \$1775 and was awarded the con'ract for a steam heating plant for School No. 13, at Jersey Clty, N. J.

THE LAWMAKERS of the Senate wing of the Capitol Building at Harriaburg, Pa., according to a local paper, are to have a \$12,550 lavatory and toilet room, with Russian and Turkish baths, equipped with Italian, Geneva, white and pink Tennessee marbles, mosaic tiling, bevel edge French plate glass mirrors, porcelain closets, with polished brass fittings, electro-bronzed stairway, mahogany doors and the like. P. H. Vaughn has the contract and has al ready begun work. It will be completed by December 1.

EAMES & LEE, Northampton, Mass., have taken the contract for plumbing and heating the residence in process of erection for superintendent L. C. Wright on Crescent street. The heating will be done with a combination steam, hot air and hot water apparatus manufactured by the H. B. Smith Company of Westfield.

Grassler & Gezelschap of Milwaukee, Wis., during the last few weeks have set the following: A No. 320 eight-section Richmond steam heater in the residence of Hugh Meca of Milwaukee, a No. 320 eight section Richmond steam heater in the residence of F. Meyers, a No. 320 eight-section Richmond hot water heater in Ebben Grassler's house and two No. 320 ninesection Richmond steam heaters in the school building belonging to the Grace Congregation of Milwaukee.

An APPROPRIATION is being considered by the City Council of Woonsocket, R. I., for a heating and ventilating plant for the new Boyden Street School.

FRANK I LESSARD & Co., Manchester, N. H.; W. L Blake & Co., Portland, Maine; Gco. R. Estabrook, Springfield, Mass., and J. W. Gifford, & Co., Attleboro, Mass., all report a lively trade in the Richmond steam and hot water heating apparatus.

GEO. E. THOMPSON, Newtonville, Mass., has secured the contract for heating the city stables at West Newton, and will use one of the Boynton Furnace Company's No. 37 hot water heaters.

THE WELLS & NEWTON COMPANY, 274 Dearborn street, Chicago, are to instal a steam heating plant in the S. H. Candee apartment building, Pearson and State streets.

Amono the contracts recently taken by B. D. Duggan, 207-209 Lake street, Chicago, can be mentioned the follow ing: Steam heating plant for the residence of Mrs. Mary Rosch, Hamblin avenue, nesr Ogden; hot water heating plant for the residence of J. Grassie, 299 West Court street; steam heating plant for the residence of David Hillman, 1625 Fulton street.

KEIM BROS. & MERTZ, 289 East Kirzie street, Chicago, have the contract for hot water heating in the residence of Wm. Sollitt, Washington boulevard.

FOSTER & GLIDDEN, 58 Dearborn street, Chicago, are to place a Farqubar hot water heater in the residence of W. H. Winslow, River Forest, Ill.

B. F. Kinden, Desplaines, Ill., is to place a No. 8 Furman boiler in the new school building.

The Carton Furnace Company, Utica, N. Y., have been awarded the contract for heating the Butterfield House. Two steam boilers to be used, and will be set in "battery." There will be 149 radiators used; every room will be heated, also the stores on Genesee and Devereux streets will be heated. There will be about 7000 square feet of radiation used. The kitchen will be equipped for steam cooking utensils and the laundry and dry rooms will also be fitted up with the latest steam appliances. This company also have the contract for heating the new residence of John Bryan, on Lansing street, with one of their hot water boilers.

SUPERINTENDENT REGAN is about putting in a new boiler at the Industrial School at Waukesha, Wis.

THE SCHOOL BOARD OF DETROIT, MICH, awarded contracts to Whitehead & Lewis for heating and ventilating the Campbell School, at \$3797; to the Acme Heating & Ventilating Company, for the addition to the Brownson School, at \$525, and \$990 for two hot air furnaces for the addition to the Ferry Street School, and to Webster & Meathe for a fan system of indirect steam heating for the Norvell School.

AT THE MEETING of the Board of Education of Covington, Ky., the contract for heaters for the Philadelphia Street Schoothouse was awarded to the Southern Heating & Ventilating Company of East St. Louis, at their bid of \$3403, with a guarantee to keep the heaters in repair for ten years.

L. A. MENEGAUX, the plumber, of Bergenline avenue, Union Hill, N. J., has secured the contract for the plumbing work on the six new houses to be built by Otto Schultz on Palisade avenue, between Dod and Shippen streets, West Hoboken.

At the town meeting held at Barre, Mass., last Saturday afternoon the report of the committee on heating and ventilating School House No. 1 was accepted. The sum of \$1950 was appropriated, and the plan for improvement will relatively change the whole building.

THE SMITH & ANTHONY COMPANY of Boston, Mass., are at work putting in the ventilating apparatus of the High School at Greenfield, Mass. The building will be ventilated mechanically by an electric motor.

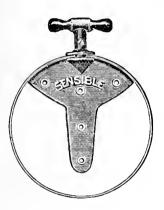

THE CONTRACT for changing the heating apparatus in the Martin & Luscomb Block, at Concord, N. H., has been let to Clifford & Hood. They are substituting one large Dunning steel submerged tube hot water boiler.

On Saturday, August 11, 29 oceangoing steamers sailed from the port of New York.

# THE RETAIL STORE.

### The Sensible Damper Clip.

The accompanying illustration shows a hot air damper clip that is being put on the market by W. E. Patchin, Rochester, N. Y. It is named the "Sensible" clip, and is furnished with either wood or iron handle. One half the handle stem is cast on the body of the clip, and the other half locks in it

The Sensible Damper Clip.

and is permanently secured by a machine screw. By this construction it is pointed out the handle never becomes loose, and is always parallel with the disk of the damper. The clip is described as cheap, simple, substantial and easily applied. The clips are sold by the Eastern Branch of the Cleveland Foundry Company, 82 North street, Boston, Mass., and A. L. Canfield, corner of Beekman and Pearl streets, New York.

# S. & P. Acme Steam Glue Pot and Stand.

The Stuart & Peterson Company, Burlington, N. J., are introducing glue pots and stand, as herewith shown. The cut indicates the manner in which the glue is heated by means of steam. The device is designed for use in plan ing mills, book binderies, furniture, refrigerator and hox factories; pattern shops, carriage manufactories, car shops,

The position of Electrical Goods in connection with the Hardware store is referred to in the following communication from a merchant in Ohio.

cation from a merchant in Ohio.

Some two years ago we added a line of Electrical Goods to our stock, and the growth of the trade has been something unprecedented, showing conclusively that the goods are a part of legitimate Hardware. We have found the necessary stock to consist of Batteries, wet and dry, Annunciator and Paraffined Wire, Staples, Tape, extra Zincs, extra Jars, Push Buttons, wood and metal, Switches, Bells, Floor Pushes. Desk Pushes, Portable or Hand Pushes, Double Silk Cord and the necessary Tools—Pliers, Pincers, Long Bits, Wire Gauges, Chisels, Braces, &c., and with the line, Speaking Tubes, Mouth Pieces, Tubing and Indicators.

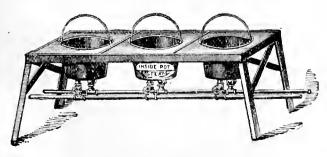

### Sturges Steel Churn.

The Chicago Stamping Company, Chicago, Ill., are putting on the market

Fig. 1 .- Sturges Steel Churn.

a steel churn, illustrations of which are given herewith. The churn is made of heavy steel plate thickly coated with chemically pure tin; while the stand, which is also of steel, is decorated in

S. & P. Acme Steam Glue Pot and Stand.

&c. The stands are made for holding from one to six pots, which are tinned inside, blue enamel finish outside, and provided with brass bails.

colors. The inside of the churn is amooth, making it as easy to clean as an earthen vessel. The cover is the diameter of the churn's mouth, and has 1

inch cork lining around the edge to prevent leakage. In the cover is a glass vent and peep hole for determining when butter comes and also to let off the gases. The manufacturers refer to the

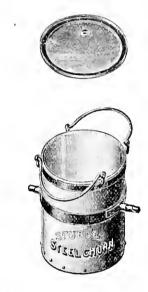

Fig. 2.-Interior of Churn and the Cover.

ease with which the churn may be kept sweet and clean, and to the fact that there are no hoops to fall off and cause the churn to leak.

### Christmas Tree Holder.

The Penn Hardware Company, Reading, Pa., are offering a holder for Christmas trees, as illustrated herewith. It consists of a base and cylinder made en-

Christmas Tree Holder.

tirely of iron, well riveted, measuring 8 inches across the base and standing 8 inches high. The cylinder is finished in ebony and the base in ebony and gold. The holder can be securely fastened by four wood screws through its base, while the tree is held in position in the cylinder by three set screws, for adjusting which a small wrench accompanies each holder. The advantages and finish of the holder are points emphasized by the manufacturers. The holders are intended to retail for 50 cents each.

# STOVE TRADE NOTES.

### St. Louis Stove Trade.

The stove trade shows signs of gradual improvement, and salesmen are sending in some substantial orders. In some acctions, notably Westeru Kansas and Nebraska, trade will be light, as crops are practically destroyed. Missouri, Illinois, Iowa and the South will be in position to buy quite largely, as the crops are more than satisfactory in the sections named. The sensation of the season is the remarkable demand for cast iron air tight heaters for coal, and sheet iron air tight heaters for wood. Of the latter there are being manufactured five different kinds by as many manufacturers, and the combined sale is expected to reach 30,000 stoves. The cast iron air tight heater is made especially for soft coal, and as they will keep fire from 24 to 36 hours without any attention, it is believed they will largely take the place of base burners.

The principal drawback to the stove business at this time, from the manufacturers' point of view, is the refusal of some dealers to place their orders for delivery later on. All the foundries here are running, and should the season be short, the St. Lovis manufacturers will be in excellent shape to take advantage of it, as they will be able to ship promptly any quantity which may be desired. With the tariff bill out of the way, there seems to he no good reason why trade should not rapidly improve. The outlook to-day is better than it has been for months, and it is to be hoped will continue to improve.

# The Thatcher Furnace Company.

The Thatcher Furnace Company, 240 Water street. New York, are issuing their 1894 catalogue, which contains 32 pages, in a colored bristol board cover, on the front of which their address and line of goods are worked into an attractive design, and the back shows their foundry and manufacturing plant, at Newark, N. J. The house was established in 1850 by J. M. Thatcher, and in the preface they state "Our aim is to reach the highest possible standard." The first pages describe and give directions for putting up the Thatcher tubular furnace, followed by sectional cuts showing it in a brick casing; in portable form with the flames indicated by colored ink; for a brick casing with double radiator, and with a hot water attachment, which is made in two sizes. The furnace has a series of cast iron tubes, just above the fire, which present a large air heating surface, and above them is a large radiator, against which the air strlkes after leaving the tubes and through which the amoke passes. The fire pot

is of the extended surface character. being covered with prongs 3 inches long, which in addition to heating the air, prevent a rush of air past the fire pot unheated. The Scorcher furnace has a heavy corrugated cast iron fire pot and dome section, to which a steel radiator section of the indirect draft type is attached. This is followed by the Thatcher ventilating heater for schools or halls which takes cold air from the floor and sends it heated from the top. A sectional cut and a description of their furnace grate are then shown. The No 80 Thatcher is a single oven right or left hand range with labor saving grate, high shelf, canopy and water back adapted for horizontal or upright boiler. The range is designed for use without being built in. No. 8 Thatcher is a double oven range of handsome appearance with all modern improvements, and needs no build-The remaining pages give some useful information and tables on furnace setting, and nearly 100 testimonials from owners of residences in all parts of the United States who praise the Thatcher furnace. The Champion ateam and hot water heaters made by the house are shown in a special catalogue which will be furnished on appli-

### Detroit Stove Works.

The illustrated catalogue issued by the Detroit Stove Works, Detroit, Mich, for the present season is quite different from the previous publications of this well-known concern. pamphlet is of oblong shape measuring 9 x 7 inches in size, bound in flexible covers and contains 96 pages. The front cover is an artistic piece of work, the name of the concern and their trade-mark being stamped and gilt embellished, the whole being on a acroll panel of chaste design. A half-tone portrait of William F. Tefft serves as a frontis-piece; then there are views of the Detroit Stove Works, of the Chicago and Buffalo houses, and a telegraphic code follows with particulars of prices and terms. A detailed description with broken views of the Jewel steel ranges for hard coal, soft coal, coke or wood follows; then come the regular notices with cuts of these ranges. six styles being illustrated. The Jewel steel being illustrated. ranges for hard or soft coal or wood are next similarly described in detail, followed by four illustrations. The Merit Jewel range comes next in 12 different styles. The Empire Jewel range is shown in six styles and seven sizes. Pacific Jewel range, which is for wood only, is shown in six styles and six sizes. The Atlantic Jewel range follows, and then comes a folding page giving a large view of the Sterling Jewel coal cook for 1894. It is a stove intended for burning hard coal, soft coal or wood, made in three styles and eight sizes. The Home Jewel wood cook is similarly illustrated with a large engraving, this stove being made in two styles and seven sizes and adapted for wood only. The Home Jewel, Marvel Jewel, Modern Herald, Jewel Range, Jr.,

Grand Jewel and Charter complete the assortment of ranges and cooks. remainder of the pamphlet is given up to heating stoves, the names being the Imperial Jewel, a large illustration showing the handsome design of this construction. Various smaller illustrations likewise show the other styles. Peerlesa Jewel, Signet Jewel, Radiant Jewel, Popular Jewel, Solar Jewel and Jewel base heater follow in the order named Particular prominence is given to the Detroit Jewel for coal or wood. The Oak Jewel is shown in four styles. Later on in the pamphlet many smaller atoves are illustrated, including laundry stoves, farmers' boilers, &c. To-ward the close is an illustration of the parts of the stove with list facilitating the ordering of repairs. An index to telegraphic code and general index complete the volume.

### Ventilating Back Linings.

How many atove merchanta thoroughly understand the function of the amall holes in the sides of a cook atove or range just back of the end door of the fire chamber? If iron linings are used they fulfill a most important function in ventilating the llning and preventing it from burning out. If prevening it from ourning out. It brick linings are used the ventilation is, of course, not so important. It may be assumed that everybody knows this, but they do not. Small points like this are often overlooked even by experts. Not many years since a large stove company less. years since a large stove company lost no less than \$5000 on this account. They had made a range which proved very popular, and in getting up something new two or three years later they embodied in it, as they supposed, all the good features of the popular range. The new range had not been in the hands of the trade more than three months before an order came in from a dealer for a new back lining. It startled the manager, as there had been no such experience with the old range, and he wrote for particulars, but was merely told that the lining had burnt out. That was the forerunner of a shower of orders for back linings. The pattern maker was called in, and the question put to him was, what changes were made in the construction of the range? He answered that none had been made in the interior construction, but only in the exterior, and he was positive that the two ranges were absolutely the same. Yet he could not explain why the back lining of the new one was giving out so rapidly while the old one was rendering perfect satisfaction. The manager was in a quandary. He went out to the sample room and sat down opposite specimens of the two ranges atanding side by side. Looking from one to the other he could see nothing that indicated any special change, until suddenly he saw that the ventilating holes in the side of the old range had not been duplicated in the new one. The side frame had been cast solid through some oversight. This cleared up the whole trouble at once. It had been taken for granted that the holes were in the pattern, and nobody thought of looking to see if that was the case. The pattern maker was dumfounded when he was shown the blunder. The little lesson in the necessity of ventilating the back lining cost the company \$5000, as above stated, in furnishing new linings and replacing defective ranges with new ones.

### M. Hertenstein & Co.

of Columbus, Ohio, have issued an illustrated catalogue and price list consisting of 50 pages of letter press, fully illustrated and bound in paper covers. The goods which the company manufacture are varied in character and embrace constructions embodying the latest improvements. The leading place in the work is given to the Art Royal, a new six-hole range intended for coal and wood. It is made in three sizes and has ovens 18 x 19 and 20 x 21 inches in size. Following this we find the Grand Royal range for wood only. This is also made in three sizes and the usual modifications. The Gem Royal is an attractive cook stove made for burning coal and wood and also for wood only. Under the name "Splendid" the company offer a substantial six-hole range having large fire pot, shaking and dumping grate, oven door opener, large pouch feed and cut top. The range is heavy in all its parts, especially in the fire box. Other goods include the new Gilt Edge two flue cook stove; the Plain Primate four-hole cook, shown in several varieties; the Daisy, for coal, and the Eastwood, a first-class wood cook. The heaters are represented with the Gilt Edge Oak occupying the place of honor. This has a large ash pan, of honor. This has a large asn pan, heavy fire pot and a draw center grate. The Hot Wave is a fancy square heater made in two sizes. The Laurel is a new Franklin, intended for using hard or soft coal or natural gas as fuel; the Beacon is a fancy direct draft parlor stove for hard or soft coal; the Winena is a light cannon stove made in two sizes, and the Gilt Edge is a laundry stove for burning coal. These, with others, complete the assortment.

### Dockash Stoves and Ranges.

The Scranton Stove Works, Scranton. Pa., have just issued from the press an exceedingly attractive cat alogue of the Dockash series of ranges, cook stoves and heaters, which they manufacture in almost endless variety. The printing is on a good quality of paper, each page being embellished with an ornamental corner piece carrying the name of the company and a fac-simile of their trade mark. The binding is in flexible covers of good quality, ornsmented with a side and back title in black. The frontispiece is a bird's eye view of the company's new works at the corner of Jefferson avenue and New York street. The first 90 pages are devoted to various lines of ranges ornamented in an attractive manner and embodying constructive features which have established for the goods an enviable reputation. They are offered under such names as Dockash, Easter Dockash, Wyoming, Lacka-wanna, Model Dockash, Dock Corn and the Dockash Excelsior. Under the name of Dockash the com-pany offer the trade a steel range made in three sizes and fitted with the latest improvements. The cook stoves are represented by the Universal, Oakwood, Longfellow, Gladstone, Nichols and the Dockash. The heaters occupy the remaining 20 pages of the catalogue

and include the Grand Dockash square parlor stove for hard coal, shown with and without oven; the Grand Garnet, another square parlor heater made in three sizes plain and two sizes with oven; the Mystic Dockash, with full revertible flue; the Dockash surface burner; the Central Sun; the Lacka-wanna and the Office King. Oher pages are given up to an illustrated de-acription of the Hypocaust system, which is referred to as something new in oven ventilation; caldrons, portable ovens, directions for ordering repairs; a list of obsolete patterns for which plates can be supplied and an illustrated notice of the Dockash grate. The catalogue is neatly printed and arranged and gives evidence of careful attention to details which are likely to be apprecisted by the trade.

### ODD PLATES.

T. H. Prest, president of the Prest Heating Company, Kansas City, Mo., was the guest of President Chas. Lyons of the Thatcher Furnace Company, New York, this week. The Prest Heating Company have the agency for the Thatcher tubular furnace in their acction.

THE COLUMBIA STOVE & RANGE COMPANY, with a capital stock of \$10,000, were recently incorporated at Columbus, Ohio. The incorporators are W. L. Whitman, H. A. Keye, E. J. Bird, Jr., W. G. McKnight and E. E. Corn. The object of the company is to manufacture and sell stoves and ranges.

THE TRADE will be interested to learn that J. M. Kelly, for many years secretary and treasurer of the Lexington Foundry Company, Lexington, Ky., and the patentee of the wrought steel evens used with such success in that company's productions, has resigned and will engage in other business. Owing to the connections that existed between Mr. Kelly and the company, of which he was an officer, he was compelled to refuse many applications for the right to use this invention from other atove manufacturers, the change referred to removing all obstacles in this direction.

Thos. W. Gorino, formerly with the Chicago branches of Fuller & Warren Company and Boynton Furnace Company, severed his connection with the latter firm on the 1st inst. to accept the position of superintendent of the furnace department of the William Miller Range & Furnace Company of Cincinnati Ohio. Mr. Goring takes up his new duties with the benefit of over 20 years' experience in the furnace business, having been connected with the Fuller & Warren Company alone for over 18 years.

S. E SLATER, for the past 18 menths connected with the William Miller Range & Furnace Company, Cincinnati, severs his connection as heating and ventilating engineer to take up a similar position with the Chicago branch of the J. F. Pease Furnace Company of Syracuse, N. Y., on the 14th inst. Mr. Slater has many friends in Cincinnati and vicinity in the heating trade, and leaves with their best wishes for success.

THE WEIR STOVE COMPANY Of Taunton, Mass., resumed operations at their plant on Thursday, the 9th lnst.

A BUFFALO PAPER of the 8th inst. is authority for the statement that the Cooperative Stove Company of that place closed their works on that day owing to trouble with their employees, about

60 of whom quit work. The trouble is said to have originated in the polishing department, where the work is paid for by the piece, the price being fixed by the company and submitted to a committee of the employees. The polishers, it appears, claimed that the amount allowed them on a piece of work was not in proportion to the allowance generally made for the same service, and objected when the committee took up the matter. The directors refused to make any concession, and informed the men if they did not accept the terms by Saturday night, August 4, the works would be closed. While a few men only are directly interested in the price paid, the refusal of the polishers to work necessitates the suspension of operations by the entire force. On the part of the company the statement is made that the price allowed for the work was fair, that the men earned good wages and that their hours were easy. The company expect the differences to be quickly adjusted.

THE PRESBYTERIAN BOARD OF HOME MISSIONS, at Asheville, N. C., has an extensive hot air heating plant in which they use Thatcher furnaces made by the Thatcher Furnace Company, New York.

H. C. LOUDEN, a Philadelphia hot air furnace and range dealer, spent last Monday in the vicinity of Beekman and Water streets, New York.

FLETCHER, RUSSELL & Co., Limited, the well-known firm of gas engineers of Warrington, England, have brought out a new series of automatic burners that have certain interesting features. The new burner is designed to extinguish the gas when the vessel is removed from the stove and relight it when placed back on the burner. In their announcement in one of the English papers particulars are not given of the operation, but it appears that a lever arm is located at one side of the burner, with a projection rising above the level of the stone, so that when the vessel is put on the stove the lever aim is depressed and the gas turned on. Reversing the operation shuts off the gas, presumably by the assistance of a spring. It is not stated how the gas is relighted, but possibly there is a pilot light which keeps burning all the time. Now that gas is being used more extensively in this country, devices of this sort have much interest.

THE HAGEY STOVE COMPANY of St. Louis, Mo., are distributing a little pamphlet of pocket size relating to Hagey's King heater. Directions are given for setting up the stove, while a large list of testimonial letters shows the favor in which it is held by those who have used it.

A VAPOR BURNER, consisting of a standpipe, generator with tube, needle valve, flue and spout attached, together with a base comprising annular communicating cups, inlet and ignition ports; also cylinders mounted upon the rims of the outer cup and inclosed by an annular slotted cap and perforated fluged cylinders extending from the inner cup in close proximity to the generator, has been patented by Edward Kells of Cleveland, Ohio, and transferred by direct and mesne assignments to the Dangler Stove & Mfg. Company of the place named. In the operation of the burner the needle valve is partially opened when the gasoline flows freely into the cup and the ignition port, the valve remaining opened while the oil is burned out from the cup. The combustion is supported by a vigorous draft of air through the perforated cyl-

The geninders already mentioned. erator as well as the standpipe being completely enveloped by the fire be-come readily heated for the generation of the vapor therein. The expansive force of the vapor then gradually depresses the gasoline in the standpipe and forces the vapor through the orifice of the needle valve. The swift current of vapor in passing through the flue mentioned draws in the necessary amount of air before entering the combustion chamber. The vapor being once formed it passes directly into the combustion chamber and Ignites through the slita of the burner.

THE CHICAGO & ERIE STOVE COM-PANY, Erie, Pa., have added to their assortment two styles of Invincible gas heaters, which are of attractive design and satisfactory construction. They are adapted for natural and manufactured gas, there being two sizes of each made with open front and two sizes with closed front. The company announce that the latter part of the present month their estalogue will be ready for distribution to the trade, and that it will contain many new illustrations.

THE CENTURY STOVE COMPANY. Dighton, Mass., are offering the trade an attractive sheet irou cylinder surface burner known as the Century and which is made in three s.zes. It is provided with draw center grate, nickel top rim and nickel rails. It is referred to by the manufacturers as being low in price and satisfactory in operation.

THE ROCK ISLAND STOVE COMPANY of Rock Island, Ill., have about completed a model office building for the transaction of their large and constantly increasing business. The structure is located on the corner of Second avenue and Fourth street, covering an area of 35 x 50 feet, and is two stories in hight, the material employed being red brick with stone trimmings. The ground floor, which is undivided, is used as a sample room and for exhibit. ing their hot water heating apparatus. The offices of the different departments are on the second floor, the trim being quartered oak, finished in oil. In the extreme northeast corner is the private office of A. M. Blaksley, adjoining which, on the north side, is the private office of Superintendent Frank Mixter. Next in order is the bookkeepers' department, adjoining which is the vault room. On the south side of the corridor, which runs the full length of the building, and at the east end is the office of Assistant Superintendent C. K. Mixter, while adjoining it on the west is the stenographers' room. Each partition is wainscoted 5 feet high, above which are 5 feet of glass in two panes, the lower ones being chipped glass, while the upper ones are plate.

"Some sample advertisements to boom your trade" is the title of a little pamphlet, oblong in shape, which reaches us from Buck's Stove & Range Company, St. Louis, Mo. The letterpress consists of a collection of newspaper advertisements which have been prepared by the company with a view of saving time and trouble to their cus-tomers. The collection is offered as suggestions with the information that additions may be made to cover other goods if desired. The idea is for the dealer to use any one or more of the sample advertisements as "copy" for the local printer, substituting his own name for the one which appears in the sample advertisement. The company state that they have been led to adopt this acheme through "realizing that

the wide-awake dealers who handle Buck's stoves and ranges are the busiest men on earth."

THE MARCH-BROWNBACK STOVE COM-PANY of Pottstown, Pa, favor us with a folder illustrating and describing their Crown warm air furnace, which is made in five sizes, portable form, for soft coal. It is made in two sizes for brick setting and the same number in portable form as a combination hot air and hot water heater. One page is de voted to a table of dimensions and prices of the furnaces. We also have from the company a circular of the Crown slde draft furnace which is made in three sizes and for which strong claims are made

BUCK'S STOVE & RANGE COMPANY, St. Louis, Mo., started up their foundry Monday 13th inst., giving employment to 350 men. This company ran their foundry full during all of last winter, and up to May of this year, when they shut down with what they thought was sufficient stock on hand to meet the requirements of the trade for nearly the balance of the year. Orders already received, however, have compelled them to start up again, and as the indications point to a shortage of stoves throughout the country before the season is over, this company have started up, and expect to run full during the balance of the year, and thus be in position to fill all orders intrusted to them. The demand for their Buck's Royal air tight heater and Buck's steel ranges has been exceedingly heavy, and their stock of these goods was nearly depleted. With their foundry running full, however, they state there will be no possibility of a shortage in these or any of the goods they manu-

THE DETROIT GALVANIZING & SHEET METAL WORKS of Detroit, Mich., are offering to the trade this season their Surprise air-tight heater, which is made of planished or amouth iron, with sheet steel linings and nickeled top ornaments. It is arranged to burn cord wood, chips, bark, roots, corn cobs and in fact anything combustible which can be put into a 13-inch round hole. makers claim that the stove will hold fire with hardwood for 36 hours, and will quickly heat an ordinary sized room from zero to 80°. It stands 24 inches in hight, is 2 feet long and 17 inches wide.

THE MICHIGAN STOVE COMPANY are furnishing their customers with artistic illustrations of their Maple Garland and Carbon Garland heaters. These illustrations are photogravures, on plate paper, which are intended to be placed in the book containing colored illustrations of Garland goods sent to the company's customers a few years since. The Maple Garland is a strictly firstclass base heating wood stove, furnished in two sizes as a full base heater and two sizes for direct draft. The Carbon Garland is styled a "parlor furnace" The Carbon and is intended for coal only. It has a seamless retort combustion chamber made in one piece and so constructed as to give a reverberatory flue. An ornamental jacket, which is easily re-moved, covers this stove, making it suitable in adornment for any parlor, rsnking with the highest grade base burners. It is furnished in three sizes.

The long drought in the West has been broken by rains which fell on Saturday last over a large part of Illinois, Iowa and Indiana.

Meetings of the Vapor Stove Men.

The regular annual meeting of the United Vapor Stove Manufacturers' Association was held at the Hollenden, Cleveland, Ohio, on Tuesday the 14th The gathering was an important one, all the manufacturing concerns in the membership being represented. Routine business was transacted, and among other things it was decided that prices and discounts on evaporating stoves should remain the same as last year. The election of officers resulted in the choice of H. M. Hubbard of Chicago, president; C. A. Stockstrom of St. Louis, vice president, and F. L. Olcott of Cleveland, commissioner.

On Wednesday, the 15th, was held, in the same place, a meeting of the Vapor Stove Manufacturers' Association of the United States, and the result of their deliberations showed that, practically, no changes were to be made in prices on generating stoves for the coming season. H. J. Trenkamp of Cleveland was elected president, E. C. Baxter of Mansfield vice-president and F. L. Olcott of Cleveland was reelected commissioner.

In view of the reports which have been current relative to the formation of a stove trust it was intimated that the manufacturers had never contemplated such combination and that the association will continue as heretofore.

#### St. Paul Stoves.

The St. Paul Stove Works of St. Paul, Minn., have opened a down town salesroom and general office at 71 and 73 West Seventh street. They have ample space for a fine sample room, which is not only large but well lighted in every part. In one of their show windows they display an Early Breakfast range which was in use for 25 years, is still in excellent condition and was purchased of the owner in order to show the durability of this line of goods. The company have recently brought out a stove specially adapted to the use of lignite, which is found so extensively in many portlons of the West. Numerous attempts have been made to utilize the great deposits of lignite for fuel, but no one had been conspicuously successful until the St. Paul Stove Works undertook a long series of experiments, which resulted in the invention of a special fire pot. This fire pot has a double grate. The upper grate is a plate with coarse openings, on which the fire is kindled. The lower grate is flat, with a cone projecting from the center into the middle of the upper grate. The cone is made with a series of steps, with perforations in the vertical portions or risers. When the lignite disintegrates by the action of the heat the portions which fall through the upper grate drop upon the lower one or on the steps of the cone, where they are held and burn. This peculiar form of grate was devised because it was found that to make lignite burn it was necessary to have a good draft and to hold the body of the fuel in such a position that it could not fall through to the bottom of the stove. In cook stoves or ranges the lower grate is provided with two cones. As lignite burns to fine ashes like wood, no dump is needed, but merely shaker. The grate is patented. The company have had their lignite stoves on the market but a short time, yet they are already receiving strong testimonials from those using them, and are (Continued on page 61).

# TRADE REPORT.

## The Iron Market.

Thus far in the Iron trade no marked volume of orders has been noted as a consequence of the removal of tariff agitation. It is probably too early to expect it. Yet there is, on the whole, a general disinclination to take a very sanguine view of the matter. It is acknowledged on all sides that some improvement in business should follow the adjournment of Congress. Those who enjoy worrying have now turned to the crop situation as a topic for mournful forebodings. The week has not been fruitful of happenings in the Iron trade. A new source of trouble threatens the Connellsville Coke region in the scarcity of water. Additional furnaces have blown in in Western Pennsylvania and Ohio, but still Bessemer Pig and Steel Billets hold their own fairly well. There is more inquiry for Wire Rods, but buyers and sellers are still apart. In Finished Material there has been more activity, but prices are again weakening under the active competition of the milis, every one of which wants to run full in order to reduce cost to a minimum. Some good orders have been secured in different parts of the country, but Pittsburgh and the neigh-boring districts have taken all the work.

Pig Iron.—As yet there are no indications in this market of a revival in the demand, and sellers remain sufficiently numerous to keep values down. There has been some talk of advancing prices on Lehigh brands, but nothing has come of the movement. We quote standard brands \$12.50 @ \$13 for No. 1; \$11 @ \$12 for No. 2, at tidewater. Southern Iron, same delivery, \$11.50 @ \$12.25 for No. 1; \$10.50 @ \$11 for No. 2; \$10 @ \$10.25 for No. 3; \$10.25 @ \$10.75 for No. 2 Soft, and \$10.50 @ \$11 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9.75 @ \$10.25.

Our Philadelphia correspondent says: The market is very steady for this article, the large increase in production during the past 30 days not having been felt as yet. Prices are firm all along the line, some claim that they are higher, and while that may be so in individual cases it is, neverthe less, true that Iron can be found at the old figures for moderate quantities. Alabama Irons are practically out of the race, the figures asked being entirely prohibitory for the time being. Western Irons are also less in evidence than they have been for some time, so that the trade is divided between Virginia Irons and those made in Eastern Pennsylvania. The demand is somewhat larger than it has been, but not enough to do more than offset the increased supply. The general market may be quoted about as follows:

Standard No. 1 Foundry X	12.50 @	
Standard No. 2 Foundry X	11.50 @	
No. 2 Plain	10.75 @	
No. 1 Soft	11.60 @	
No. 2 Soft	10.75 @	11.00

From Chicago our advices are as follows: Local Coke continues to monopolize the trade. Sales have been re-

cently made in localities that for some years had been wholly given over to Irons from other sections. General consumers in this vicinity are increasing their purchases and shipments are rapidly swelling. Few orders are now being placed which do not call for deliveries to begin promptly. Southern furnace agents report small sales, but Southern state that they are selling about all the Iron now available from their furnaces, some grades being in very short supply. The Tennessee Company have advanced prices this week 25¢ on No. 2 Foundry. A fair inquiry is being received for Soft Irons, but consumers are slow to contract at prices now ruling. Lake Superior Charcoal is still very quiet. Quotations are given as follows for

Lake Superior Charcoal	\$14.25 @	
Local Coke Foundry, No. 1	10.25 @	10.50
Local Coke Foundry, No. 2	10.00 @	10.25
Local Coke Foundry, No. 3	9.50 🔞	10,00
Local Scotch	10,25 @	10.50
Ohio Strong Softeners No. 1	13.00 @	13.60
Southern Silvery, No. 1		
Southern Silvery, No. 2		
Southern Coke, No. 2		-11.25
Southern Coke, No. 3	10.50 @	10,75
Southern, No. 1, Soft	10.75 @	11.25
Southern. No. 2, Soft	10.50 @	10.75
Tennessee Charcoal, No. 1	@	
Tennessee Charcoal, No. 2		

From Pittsburgh we learn the Valley furnaces made some progress last week toward getting started, several furnaces getting enough Coke ahead, and promised, to warrant them in lighting up. The demand for Foundry Iron continues light, but the supply is very limited and prices are firm. For close delivery we quote as follows:

No. 1 Foundry.......\$11.75 @ \$12.60,eash. No. 2 Foundry.........10.75 @ 11.00 "

From Cincinnati we have the following report: There has been an undertone of confidence in the market for Southern Pig Iron during the week, as there has been for several weeks, and it has developed to an advance of 25¢ B ton on No. 2 Foundry. Some furnaces are asking still higher prices, but it is not what they ask, but what they can obtain, that establishes the market prices, and the rate fairly quotable for prices, and the rate fairly quotable for No. 2 Foundry is \$7 50 \$7 ton f.o.b. Birmingham, and No. 1 Foundry is \$8.25, but the demand for the latter is small. There is little No. 3 Foundry offered or wanted, and the price of that and of Mottled Coke Iron is without quotable change. There is more urging to sell Lake Superior Car Wheel and Malleable Iron, and much lower prices have been accepted. There has been some increase in the supply of fuel in the South, but there remains some minor troubles to be adjusted, which it is thought will be harmonized before long, and that supplies of Iron will soon be more adequate, but under the prevailing senti-ments prices are likely to be sustained. Quotations are as follows:

Southern Coke, No. 1 \$10.50 @	810.75
Southern Coke, No. 2 9.75 @	
Southern Coke, No. 3 9.25 @	9.5⊍
Ohio Soft Stone Coal, No. 1 14.50 @	15.50
Ohio Soft Stone Coal, No. 2 14.00 @	14.50
Lake Superior Coke, No. 1 12.50 @	13.00
Lake Superior Coke, No. 2 11.50 @	12.00
Hanging Rock Charcoal, No. 1., 16.00	17.00
Hanging Rock Charcoal, No. 2. 15.50 @	16.00
Tennessee Charcoal, No. 1 13.00	13.50
Tennessee Charcoai, No. 2 12.00 @	12.50

At St. Louis the situation improves very slowly. Consumers are gradually increasing their orders, and furnaces are holding their prices tirm. Production will shortly be increased by the blowing in of furnaces, but as most of the furnaces have a fair share of business on their books this increase will not materially affect prices. There is no disposition among furnacemen to solicit long time contracts, as they anticipate an upward move before the year closes. At \$10.50 No. 2 foundry seems bottom, and furnaces refuse to shade this price. We quote as follows for cash, f.o.b. cars St. Louis:

 Southern Coke, No. 1 Foundry
 \$11.00 @ \$11.25

 Southern Coke, No. 2 Foundry
 10.25 @ 10.40

 Southern Coke, No. 3 Foundry
 9.75 @ 10.00

 Southern Car Wheel
 16.50 @ 17.00

# Metal Market.

Pig Tin.—In a wholesale way during the past week prices have been gradually moved upward, though in quotations for small lots there is no change to report. There has been some speculation in the mean time. Official records show about 250 tons. Quite as much is understood to have been done outside. Purchases for jobbing and consumptive account have not varied much from ordinary lines, however, and the rise, happening as it does in the face of adverse statistical position, has peculiarities indicating that the Continental syndicate or the old leaders are exercising their power of manipulation. Certain it is that New York has danced to some foreign piping in the matter of making prices and conducting speculative deals. Indications are that some interest on the other side of the Atlantic is playing a bold game.

Copper.-The Copper market has a ragged aort of appearance, the result of rumors of another attempt to form one of those peculiar international combinations for mutual benefit and free selling while negotiations in that line were pending. There is good reason to be-lieve that enough American Copper to have a weighty influence remains on the European market. Over 195 000,000 pounds of ingots and bars, besides 24,-000 tons of matte were shipped thence from this country during the year ending July 1, 1894. Despite these heavy shipments an ample supply remains here. In small lots there has been no change in either Manufactured or Ingot Copper.

Pig Lead.—At one time during the week under review the wholesale price for common domestic advanced nearly \$\psi\$ a pound prompt delivery, owing to small stock available. Subsequent arrivals and offerings from the West brought the spot price down to former quotations for carload lots. The passage of the Senate tariff bill prompted speculators to offer distant future deliveries at lower figures, but little business was done, and buyers acted very indifferently. In small lots prices are a little stronger than a week ago.

Spelter.-Merely routine business, and little of it, has been effected in this market. The offering has not increased perceptibly and the demand has been hardly of average volume. Small lots of Spelter are unchanged in price and Sheet Zinc is the same as last reported.

Tin Plate.-The market in small lots has not altered quotably since our last writing. Stocks are very much broken up here and at the same time very light, and while the demand is also very small prices are not quotably lower in anticipation of the lower market that is thought will follow the expected reduction in tariff. The future is still uncertain and opinions differ as to the amount that the current market prices will be affected by the new rate of duty. Trade is very dull.

The monthly production of Copper in the United States has been as follows, according to John Stanton, the first column giving the aggregate returns from the reporting mines, which include the principal Lake, Montana and Arizona producers; the second being the metal from pyrites and from a number of smaller outside sources, being estimated:

#### American Product.

Reporting mines. Gross tons. Second half	Outside sources. Gross tons.	Total. Gross tons.

W. W. FERRY, who for the past six years has been the Boston representative of the St. Louis Stamping Company, was recently made the recipient of a testimonial in appreciation of his business integrity and charming social character. A number of Boston's leading tradesmen in the Tinware line met in the office of the Dover Stamping Company, July 31, and presented him with a handsome silver and gold punch bowl, inscribed as follows: "Presented to W. W. Ferry by his business friends, August 1, 1894." Mayor Henry E. Ticke of Pawtucket, in making the presentation, said: "We meet here today to say farewell to our oleasant business relations with Mr. Ferry, and to wish him godspeed and good luck in his new field of action. In joining in this testimonial competitors forget their

rivalry and buyers their discounts, and all unite in tendering with the gift their hest wishes for Mr. Ferrry's prosperity Following are the names of the donors: W. S. Adsms, Thomas Barker, John F. Bingham, Dover Stamping Company, George H Guest, M. J. Goflin, James W. Lothrop, L. T. Milligan, F A. Mc-Mann, Thomas C. Newall & Co., Scavey Mfg. Company, Smith & Whittier, Usher & Osborne, W. F. Watters, H. E. Tiepke, Andrew Hawes and Clark-Sawyer Company. Mr. Ferry will join C. W. Dunlap, the veteran manufacturer of House Furnishing Goods in New York, and hereafter very largely manage the business, he having been with Mr. Dunlap, his father-in-law, from 1879 to 1888.

# Chicago Report.

E. Bissell, Son & Co., 12 Murray street and 15 Park Place, New York, among the Special Notices this week announce a sale for Tuesday, August 21, in which by order of the St. Louis 21, in which by order of the St. Louis Stamping Company, Granite and Blue and White Ware, seconds and first quality Granite Ware, discarded numbers, will be disposed of, together with a quantity of Solid Steel Market Cleavers. A sale is also announced for Wednesday and Thursday, August 22 and 23, when a large assortment of Table and Pocket Cutlery, Silver Plated Ware, &c., will be offered.

### CONDITION OF THE

# Hardware Trade.

THE PASSAGE of the tariff bill.
which it is generally assumed
will become a law, is, of course, the chief subject of interest which has come up during the week, but even this creates no excitement, as there are few lines of Hardware in which are few lines of Hardware in which the foreign manufacturer can hope to compete successfully with Ameri-can manufacturers in the home mar-ket at present prices. The dull-ness of trade for more than a year and the agitation of tariff changes have led to very low prices and the discounting of the effect of the reduction of duties. It is to be hoped that the removal of uncertainty regarding the tariff, particularly in view of the very low prices now prevailing for goods, will lead to more liberality in orders and an improvement in business generally. There seems little chance that the merchant will be compelled to mark down goods bought at present prices.

Advices from Chicago.—Jobbera report a better trade in Shelf Hardware than before the strike. Busiware than before the strike. Business has thus more than recovered its ground. Orders are steadily growing, not only more numerous but larger. Inquiries are being received from many country merchants as to prices on quantities, which indicate the growth of a sentiment in favor of laying in stocks. Crop reports continue of a mixed character, some localtime of a mixed character, some localities suffering from absolute failure, while others are in good shape. Taking the good with the bad, the outlook for the trade from this vicinity is not seriously discouraging. While the fall trade, which is beginning, may not be up to the full average, it is now expected to be considerably better than was feared in July ably better than was feared in July. Tin Plate and Tinners' Stock generally are in excellent demand and Builders' Hardware is in better request. Staple goods are beginning to move also. Collections are not up to what they were in June, but this is ascribed to the prevalence of harvest in the past

### Notes on Prices.

farmers in their fields.

two or three weeks, which has kept

Wire Nails .- The increase in demand previously noted continues and atocks are small and growing less, but on the other hand factories are prepar-ing to start up again. The New York price for small lots from store is \$1.30 to \$1 35

Advices from Chicago.—The inquiry is growing, but there is no other indication that the regular fall trade has opened. Factories are now getting into operation gradually, and the situation is growing interesting. Manufacturers are endeavoring to keep up prices, but will only succeed if the demand grows to equal their output. Small lots from stock are regularly quoted at \$1.20, with concessions to best trade.

Cut Nalls -'There is little change to note. The demand continues moderate, note. The demand continues moderate, stocks are light and prices unchanged. The store price for Cut Nails in New York is \$1.10 to \$1.15.

Advices from Chicago.— Merchants are only supplying their immediate needs, and therefore sales are confined

to small lots. Contracting for the fall trade has not yet begun. The local factory, however, manages to keep in operation. Small lots from store sell at \$1.10 to \$1 15.

Barb Wire.—The demand in the

East continues small, but more activity

is reported in the West. There is no change in prices.

Glass.-Manufacturers and jobbers report a fair but quiet demand for Glass, with hopes that as the season advancés trade will improve. Satisfactory prices for Glass appear rather the exception than the rule. An interesting statement is made that the total product of the season of 1893 94 was 3,189,552 fifty-foot boxes of American Window Glass, against 5,200,000 boxes in the season of 1892-93; also that if the present demand for Glass continues, unimportant though it may be, little available glass will be on hand by September 15. At a recent meeting of window glass manufacturers in Chicago, a wage committee was appointed to meet a like body from the workers.

## Trade Notes.

THE CANFIELD STOVE COMPANY, Rondout, N. Y., continue advertising their business in Stoves, Plumbing, Gas, Steam and Hot Water Fitting in a poetical vein. A recent issue of a local paper contains four verses on the Vapor Stoves handled by this concern.

THE UNITED STATES RADIATOR COM-PANY. Dunkirk, N. Y., in our advertising columns this week, call attention to their line of Splendid Radiatora. An illustration in the announcement shows the Corper Radiator made by this firm.

THE SPICER MFG. COMPANY Of New Philadelphia, Ohio, report large shipments of their sheet metal Trucks within the past week to Falcon Tin Plate and Sheet Company, Niles, Ohio; New Castle Steel & Tin Plate Company, New Castle, Pa., and Caldwell & Peterson Company, Wheeling, W. Va.

SIDNEY SHEPARD & Co., Buffalo, N. Y., have just completed the erection of a new galvanizing plant, built upon the latest plans and using the most recent methods. Their large business in Coal Hods and other galvanized ware has made it necessary to make this extension to their facilities.

THE OHIO MOP, PAIL & WRINGER COMPANY of Tolcdo bave been incorporated, with a capital stock of \$10,000.

ELI HILLSON, buyer for H. M. Hilson & Co., Boston, Mass., manufacturers and dealers in Tinware and Kitchen Furnishing Goods, will be in New York about August 23 on business connected with his firm. He will make his headquarters at 35 Warren street.

C. SIDNEY SHEPARD & Co., 23 and 25 Randolph street, Chicago, have issued their fall circular of seasonable goods, covering 24 broad pages. It is nicely gotten up, with pink cover, and profusely illustrated. A very large line of coal vases is shown, followed by numerous patterns of stove boards, coal hods, coal and fire shovels, pokers, lid lifters, coal tongs, skillets, fry pans, elbows, roast pans, hollow ware, dampers, teakettles, lanterns, &c. The firm are agents for the Palermo Mica Company, whose price-list is inserted, covering two pages of the catalogue.

THE HORNE & DANZ COMPANY, manufacturers of Tinware at 57 East Fillmore street, St. Paul, Minn., are pushing business as vigorously as possible, but report that for some time trade has been far from satisfactory. A contemplated enlargement of the plant has been deferred until times are more propitious.

(Continued from page 58.)

highly gratified at the manner in which sales are steadily increasing. The special stoves they have thus far brought out are the Early Breakfast lignite range and the Faultless liquite base burner. These using them state that they have no trouble in keeping fire overnight or in baking and cooking. The range is so made that it can be used for lignite or for burning hay and straw or for coal, by merely changing the grate. It is the intention of the company to put their lignite grates into nearly all of their coal burning heating stoves, so that they will be adapted to the use of either fuel. A new catalogue is in course of preparation which will show material additions to the company's line of Faultless heating stoves and Early Breakfast cooking stoves and ranges.

### R. Robinson & Sons.

105 Lake street, Chicago, issue an unusually handsome catalogue this year, comprising 114 pages. It is bound in a stiff black cover, with gilt title and a Maltese cross printed in red, which is the trade-mark of the Rochester Co operativa Foundry Company, for whom the firm are Western agents. A view of the Co-operative Company's foundries, at Rochester, N. Y., is given as a frontispiece, following which is a list of some of the additions and changes for this season in the Red Cross line of stoves, ranges and heaters. These are sufficiently numerous to show that the company will not permit dull times to chill their enterprise. The goods illustrated consist of the Red Cross range, Model Red Cross raoge, 1894 Monroe range, Red Cross Herald range, Prize Foxhall range, Standard Red Cross four hole range, Red Cross Junior range, Red Cross Dexter range, Red Cross Emblem range, Red Cross Talisman range, Special range, King Bee range, Model steel range, Magic Red Cross cook, Red Cross Challenge cook, 1894 Silver Cross cook, Black Cross 1894 cook, 1894 Famous cook, Red Cro-s Champion cook, Our Chief cook, and the following line of heaters: The Red Cross "A," a first class square parlor hard coal stove, fitted with the Eclipse grate; the Royal Red Cross 1894, a square parlor hard coal atove, with Eclipse grate; the Red Cross Bee 1894, a medium square parlor hard coal stove; the Red Cross Signal 1894, a lower priced square stove; Gilt Edge 1894, a full base heater; Red Cross Jewel, a revertible flue surface burner; Red Cross Carbon 1894, a square oak radiator and circulator for soft coal, with a highly ornamented fret work exterior and an inner body of sheet steel, Eclipse grate, large circulating flues, &c.; Red Cross Oak, Model Oak 1894, Live Oak 1894, Stella, Hero, Red Cross Triumph, Red Cross Cottage, Sylvan Red Cross, Ontario, Hazel, Tecumseh, Governor, Imperial and Signal. Tailor and laundry stoves are shown in considerable variety. Several pages are devoted to the Soperior process vapor stove, after which come oil stoves of new designs. The Parlor Splendid presents the appearance of a high class square base heater. The Novelty Splendid is patterned after the Franklin stove. Round body oil heaters are shown under the name of Splendid No. 15, Splendid B10 and Splendid B8. The concluding pages of the catalogue illustrate the Bermuda hot water heater, Bermuda hot air furnace, Hornet hot air furnace and Fearless hot air furnace.

### Hot Water Heating.

The hot water method of house heating is undoubtedly growing in popularity, both with the people and the dealers all through the country. Some idea of the extent can be gained from a well defined impression that exists that one half of the radiation turned out by the manufacturers last year was for use with hot water. Preparations in a number of foundries this year have been made to supply a large demand for radiators for hot water use. both direct and indirect. People who have experienced difficulty in heating some rooms readily accept hot water as a means of heating, when it is explained that the radiator will be hot and throw off its heat in the apartment where it is located, no matter from what quarter the wind blows. Though all fitters are not as successful as they would like to be in installing hot water plants, the principle of the circulation of hot water is readily grasped and the details of the pipe fitting can be learned much easier than the apportioning of the proper amount of surface for a given room.

### Combination Heating.

From the use of an ordinary pipe coil in the fire pot of a furnace there have sprnng many devices for heating water to be circulated through radiators for warming rooms which are otherwise heated by a furnace with difficulty. Some trouble has been experienced in getting the water heater properly proportioned to the air heating capacity of the furnace, or in connecting just the right amount of radiation with it to get a satisfactory quantity of het air without beiling the water. Such satisfaction has attended the use of these apparatus that this method of heating is growing rapidly in popularity. One of the taking features is that a positive heat is afforded by the radiators and a posi-

tive change of air is the result of the constant inflow of hot air from the registers. As in many other branches of domestic engineering the authorities do not agree as to the best methods of installation. Some say that the lower floors of the building should be heated by hot air and the upper floors by the radiators, while others hold that a radiator and register should be placed in each room to secure satisfactory results. With the first method there is some possibility of the rooms warmed by radiators becoming overheated when the furnace is fired strong enough to keep those heated by hot air comfortable. With the latter method strong firing cannot produce such an effect. The installation of the double system is, however, more expensive.

### "Organized" Labor.

The labor leaders of the day are creating a class distinction which seems to be completely at variance with their professed principles of elevating the workingman and improving his condition. In their speeches and manifestoes they ring the changes on "organized" labor, as if no other kind of labor were worthy of their consideration or should receive recognition from the public, to which they are constantly appealing. There is a concerted effort to create an undoubted aristocracy in the ranks of workingmen, a privileged class with wellestablished rights and immunities. Demands are made, not in the name of labor, but in the name of "organized" labor as represented in trades unions alone. The man who works for wages may be a most exemplary citizen in every respect, rearing a family to become ornaments of society and to add strength to the commonwealth, but if he is not a member of any nnion he is utterly without place in the modern fabric of industry. The time was, and it is not far distant, when men were selected for political preferment or for responsible positions of a public character on the sole ground of their personal qualifications, and if the man so selected was taken from the ranks of the wage workers, no question was raised as to whether or not he represented a labor organization. Now, however, the man's fitness is subordinated to the great test of his fealty to a trade union. Only organized labor must be recognized, and a non-union man has no rights which any person is bound to respect. This is wholly wrong, as there are many men who are so situated that they cannot join unions or are not permitted to join them. The majority of wage workers are and will continue to be unorganized, and yet will do their proper share in developing and building up the

nation, and are not to be ignored when the true interests of labor are under consideration.

### Shop Sketches.

The ordinary manufactory, no matter what its character, can scarcely get along without the making and use of drawings or sketches in some form. Wherever there is a well established drafting room a definite system of drawings is likely to prevail. But it is in the small shop, or where few drawings are required, that the greatest laxity in methods is generally to be found. Aside, however, from finished drawings there is always a convenience in, and usually the necessity of, a simple method of making sketches and of retaining proper and permanent copies. if the originals are sent to the shop. Some persons go so far in the case of the smallest drawings as to trace and blue print them; others, in the spirit of greater economy, have adopted the plan of making pen and ink drawings in copying ink and securing therefrom the desired second copy. But still simpler and more convenient is the method recently adopted in some drafting rooms of making the drawing or sketch with an aniline pencil. If a pencil of proper softness be used, it is possible to obtain from the drawing at least three good letter press copies on tissue paper, and frequently with care four and five copies may then be made. After the lines have been set by the copying process they take on an effect that has caused some unacquainted with the method to inquire whether it was of the same character as the positive blue print and similar processes. When compared with the time consumed in making a pencil drawing, an ink tracing therefrom, and finally a blue print, before a drawing can be sent to the shop, the advantage of this scheme is evident. Furthermore there is no waiting for ink lines to dry or for sufficient sunlight to take blue prints.

Cable advices from Europe to the public press indicate the fact that British exporters are much pleased with the settlement of the tarlff question. Although not particularly enthusiastic over the Gorman bill, they prefer that measure to a continuance of the condition of uncertainty. Many traders express the opinion through the newspapers that the evil effects of the McKinley act upon the United Kingdom have been greatly overstated. The shrinkage of British exports in the first six months of 1894 equaled the shrinkage of the previous four years. The former was due to the fact that the traders were working from hand to mouth, ordering only what they immediately required, and thus remaining in a position to profit from any remission of duties.

# THE LETTER BOX.

the vent pipe well away from any win-

dow so that the air may not enter the

building. If a tree is near the cesspool

a pipe may be run up near its top. A

trap should be placed on the pipe dis-

charging into the cesspool, and a fresh

air inlet should be placed on the line of

pipe near the trap, but on the side away

from the cesspool. Having considered

these few of the objections to the use

of a cesspool, if one is to be used, the

following method of construction is

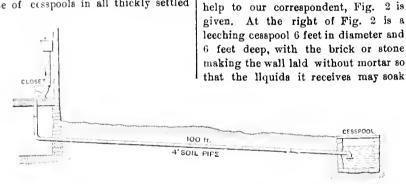

looked upon as having the greatest

number of recommendations, and as a

### Cesspools.

From W. J. S., Brooklyn, Iorca.—We have a good system of water works here and several of our citizens wish to have water closets put in their houses, but as we have no sewers I do not know just how to put them in to have them work successfully. I send a sketch, Fig. 1, of what I had thought of using, but think that there should be a trap at the cesspool. If what I suggest is not a proper system I should be glad to hear of something better, as I want to make a success of the cesspool.

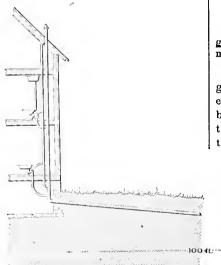

Note. - Laws are made to restrict the use of esspools in all thickly settled

Cesspools .- Fig. 1.-Showing Proposed Arrangement.

districts and in cities. It is unfortunate that a system of sewers does not precede or become adapted and laid at the same time that a system of water supply is arranged. More water is always used in buildings where it is to be had by opening a faucet. Consequently there is more waste to be disposed of and the use of modern water closet, lavatories and baths still further increases the waste. The disposal of this waste is a subject that has been given a great deal of study, and the best cesspool is regarded with little favor and its adoption should only be decided upon after a careful consideration of the possible evils that may arise from it. The stench that it oceasionally gives rise to is least objectionable, as it is apparent, but the gases that are given off are frequently of a dangerous character, showing clearly that a cesspool should be located at as great a distance as possible from all buildings. Though there is water supply in the town, it is quite possible that a number of wells are still used and the area of ground that will be contaminated by a leeching ceaspool should be considered in locating it, and, if the soil has a clay bottom, preventing the liquid from soaking down, a greater space should be given than if the soil is of a sand or gravel nature. If the cesspool is ventilated great care must be observed to keep the outlet of i

away into the earth. Its top should be a foot or more below the ground and covered with some material that will support a covering of earth. The earth covering will serve to prevent any stench arising and will largely disinfect

cumulated solid matter can be easily removed. The outlet from the receiver to the cesspool should be made by means of a T on the pipe, the top end being open to prevent it becoming air bound, and the bottom end extending down into the receiver so that the floating solids may not escape. At the opposite side of the receiver the soil pipe from the building should enter near the top. A trap should be placed on this pipe just before it enters the receiver and at the side of trap, away from the receiver a fresh air inlet should be placed on the pipe. The pipe should be run from the house with a good fall. and should run up through the house above the roof. If there are fixtures on more than one floor an air pipe should be used in addition to the soil pipe to protect the traps from siphonage.

#### Repairing Agate Ware.

From Collins & Richards, Cincinnati, Ohio. Answering the inquiry of "H. M." in The Metal Worker, August 11, Repairing Agate Ware, we send herewith a circular which explains itself.

Note.—A circular accompanies this letter relating to an enamel mending cement made by them, which is described as a thick, pastelike putty that is easily applied and can be used on tin, copper and cast iron as well as on agate ware.

### Plumbers' Soil.

From G. S., Waterville, Me.—Please give in The Metal Worker a receipt for making a good plumbers' soil.

Answer.—Make a thin solution of glue by boiling slowly in water until entirely dissolved. Then atir in lamp-black sufficient to make the mixture of the consistency of paint, simmering the compound over a slow fire for 15

Fig. 2.—Suggested Arrangement.

the foul air that comes up through it. Ample provision should be made for thoroughly cleaning frequently. Within a few feet of this leeching cesspool a water tight receiver of the same dimensions should be built and covered in the same way, and so arranged that the ac-

minutes. To test it, paint a space on a piece of pipe and rub it briskly with the dry finger; If it rubs off easily add a little glue, but if it sticks and takes a slight polish it is good. Common flour paste of good quality is used by many plumbers to stick pieces of paper

around pipe to prevent the solder spreading. After the joint is wiped, by cutting through the paper with a knife no trouble is experienced in remov-

### Recording Stove Sales.

From F. M. Borden & Bro., Philadelphia—Replying to query of "S. T. F." of Rock Hill, S. C., in The Model

ing of orders for stove repairs. Such a book carefully kept would not only be a great convenience to the dealer, but would tend to elevate the dealer in the opinion of his customers as a wide-awake merchant worthy of their patronage.

### Pattern for a T Joint.

From J. J. W., New York.—Please publish in The Metal Worker a method for developing the pattern for a I joint between pipes, the profiles of which I give. The larger pipe is to fit against the smaller one, and the patterns for both pipes are desired.

Note.—Accompanying our correspondent's inquiry are profiles of two pipes, one circular and the other a segment of a larger circle. He does not exactly define how the T joint is to be made, but we would refer him to The Metal Worker Pattern Book, section 522, page 134, where pipes of different diameters meeting at right angles are shown, and also to section 523, page 135, where the same pipes meeting at one side of the center are shown. We think his case is probably covered in one or other of these problems.

Worker, August 18, we submit a sample page of a stove record book which is, we think, quite complete, and of

# Practical Test for Plumbers.

From G. S., Waterville, Maine.—I notice in The Metal Worker that by a recently enacted law Massachusetts plumbers must pass a practical test to secure a license, and would like to inquire of some reader of The Metal Worker what the practical test consists of and what is required.

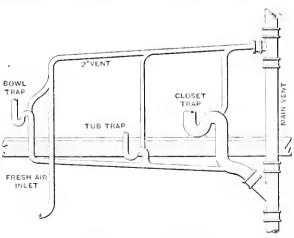

Note.—We shall be glad to hear from some Massachusetts plumber who has been through the practical test, with a description of what was required. Plumbing Inspector Tower of Springfield, Mass., presided at the practical test previously mentioned, and our correspondent might do well to write to him.

### Location of Fresh Air Inlet.

From C. F. B., New Lisbon, Ohio.— I submit a sketch of a job of plumbing that I propose to do, and would like to have the opinion of the trade on my idea of trap ventilation. The bath room is next to an outside south wall, and the fixtures are set in a row alongside it. My idea is to start 2 feet below the traps and run a pipe through the wall for a fresh air inlet from the outside. I then intend to connect a vent pipe 5 feet above the traps with the main soil pipe which runs above the roof and will take a separate vent from the top of each trap, and connect them with the main vent, which will be two inches.

Annunciators, indicating the name of the next atation, are in use on the cars of the Metropolitan and District suburban roads of London. They are aet, after leaving a station, by pulling a cord. One official controls the apparatus in all the cars of a train simultaneously. This method is found a great improvement over the old indistinct shouting of the names of stations by the conductors.

The proposed amendment to the New York State Constitution authorizing

Location of Fresh Air Inlet.

course if such a book is not complete it is useless. Our experience as jobbers of stove repairs has proven that all these questions are essential to the proper fill-

the Legislature to fix the hours of a day's labor has been reported unfavorably to the Constitutional Convention now sitting at Albany.

The Maxim Flying Machine.

From our contemporaries the London Engineer and Engineering we take the following account and drawings of the recent flight of the flying machine devised by Iliram S. Maxim. From our last named contemporary we take the following general description:

The Maxim flying machine is a large braced structure formed of steel tubes and wires, and is exceedingly stiff for its weight, which is about 8000 pounds, steam is generated. The feed pumps are placed on the deck beneath the engines, and are of variable stroke, so as to be adapted to the needs of the boiler. As they work at high speed, the valves are of large diameter—larger than that of the plungers. Pounding is prevented by a rubber bag on the suction, and spring pistons on the discharge. The total quantity of water in the boiler only amounts to 200 pounds, so that it is necessary that the amount of feed should be accurately adjusted. There is a very ingenious

shows Itself on a gauge attached to the pipe. By this most ingenious device an open faced pressure gauge is substituted for the usual gauge glasses. The weight of the boiler with casing, feed water heater, dome and uptake, is 904 pounds; with burner and water it is 1200 pounds. The heating surface is about 800 square feet and the flame surface 30 square feet.

The fuel burned in the boiler is gasoline, of a specific gravity of 72 Beaumé. It is carried in a copper vessel on deck, and is pumped through a vaporizer into

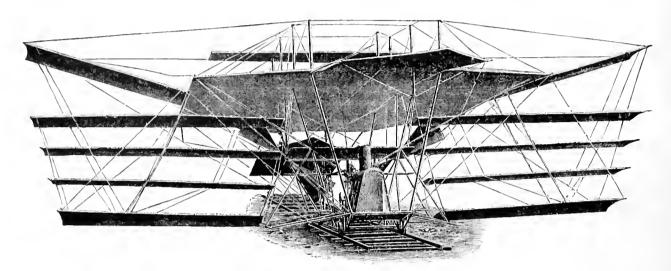

Fig. 1.-Perspective View of the Machine,

including men and stores. At its lower part it carries a deck on which the crew stand, where also the boiler, steering wheel and reservoirs of water and gasoline are mounted. At a hight of some 10 feet above the deck come the engines, each of which drives a screw propeller of 17 feet 10 inches diameter and 16 feet pitch, working in air. Above the propellers is the great aëroplane. Smaller aëroplanes project out, like wings, at the sides, the extreme width being 125 feet, and the length 104 feet. There are five pairs of wings, as shown in the illustration, Fig. 1, but the intermediate three pairs are not always used, and at the time of the accident these were not in place. At that time the area of the aeroplanes was 4000 square feet. With all the planes in position the total area is 5400 square feet. Forward and aft of the great plane are two steering planes carried on trunnions at the sides, and connected by wire strands with a drum on the deck. By turning this drum the steering planes can be simul-taneously tilted to direct the machine upward or downward, or to keep it on an even keel.

The chief interest centers on the boiler, Fig. 2, as unless this be made exceedingly light it is hopeless to expect that the machine will soar. The casing is made of straight tubes. In the boiler of the flying machine a feed heater is placed over the steam drum. The feed heater is constructed of steel tubes 18-inch hore and 12 inch thick; the water is pumped through it at a pressure 30 pounds higher than the pressure in the boiler, and is delivered through an injector like nozzle into the top of the downcomer pipe. The incoming water delivers its surplus energy to the surrounding liquid, creating a rapid and powerful current in the pipe, and consequently maintaining an active circulation in the small tubes in which the

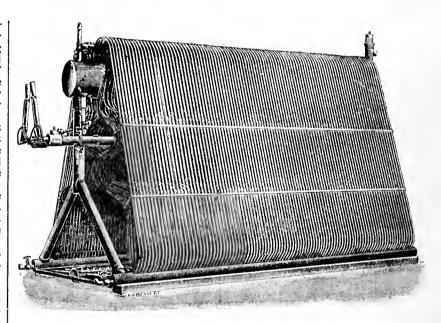

Fig. 2.—The Boiler.

THE MAXIM FLYING MACHINE.

water level indicator. A small pipe is led In a loop from front to back and from back to front of the furnace. It is then taken to the steam and water drum and led backward and forward through that in the same way below the water line. The whole is filled with water, and forms a closed circuit having two loops—one in the furnace and one in the water. Now, so long as the upper loop is in the water the pressure does not rise greatly beyond that in the boiler, because the heat taken up in the furnace is conveyed by the circulation to the water in the drum. But if the water level falls in the drum, then there is no outlet for the heat; the pressure consequently rises most rapidly, and

the furnace. The pipe from the pump is led into a vessel having a large gasoline burner beneath it. In this vessel the spirit attains a pressure of 50 pounds on the square inch, and a corresponding temperature, in which condition it is, of course, highly inflammable. The gas which it gives off is conducted by a pipe passing through the furnace to a jet, like that of a Bunsen burner, at the front of the furnace, and in rushing through it induces a powerful draft of air, with which it mixes. The combined charge passes through hollow fire bars, pierced on the upper surfaces with fine holes, and burns in 7650 separate flames. The arrangement is so powerful that the

pressure in the boiler can be raised from 100 pounds to 200 pounds in a minute. The air supply can be regulated at will, while the expenditure of gasoline automatically adap's itself to the needs of the boiler. The pressure of the gasoline vapor acts on a lever, which is balanced by a spring. If the feed is greater than the consumption the pressure on the lever puts a pawl in gear with a ratchet wheel, and through intermediate mechanism works a block along a slotted arm to reduce the throw of the gasoline feed pumps. If the feed is too small the opposite effect is produced and the throw of the pump increased.

There are two screws, each driven by a separate compound engine, having cylinders 5.05 inches and 8 inches in diameter by 12-inch stroke. The ateam is distributed by means of piston valves having 3-inch stroke and operated by eccentrics.

The boiler pressure when running is 320 pounds per square inch, giving in

Mr. Maxim's endeavors to propel a machine through the air is so marked that we think a description of this most remarkable contrivance will not just at present be out of place. It is not to be supposed for a moment that this machine approaches anything like perfection, but there can be no doubt that its performances considerably eclipse all previous efforts.

previous efforts.

This is what happened on the occasion of the flight of the machine:

The machine had traveled some 1000 feet, the latter 550 feet of which it had flown, a fact which is clearly proved by the impressions made on the inverted guard rails. It appears that suddenly the lifting effort became so great that the framework carrying the after retaining wheels became distorted to such a degree that the wheels ceased to perform their office, and the after part of the machine became free—the forepart, however, continuing to hold the machine down, but not for long, as the wobbling which ensued rendered

commenced to soar, and www ware those which were supposed to retain the machine by reason of the inverted rail above them. This they failed to do, owing to the too slender construction of the framing in their vicinity.

Above all this there is the great central acroptane, with a surface of some 1400 square feet. This, with the side wings and the steering planes fore and aft, all taken together, have a total area of 5400 square feet. At the time of the trial the area was 4000 square feet, as six of the side planes were found unnecessary. The total width is 104 feet, and the length 125 feet. The angle of the steering planes, which is about 7.25°, or 1 in 8, is controlled by a steering windlass, which when aparing turns them, very slightly, opposite ways, when the machine would soar whichever way it was being propelled. The total lift of the planes amount to 10,000 pounds. Another valuable property of these fore and aft scroplanes is their tendency to preserve the equilibrium of the machine in descent.

The boiler, Fig. 2, is a fascinating contrivance, replete as it is with so many novel features. It is a little like Thornycroft's, and a little like Yarrow's, but the tubes are necessarily much lighter and thinner than in either. Their shape is shown in Fig. 4. The water boxes at the bottom are 25 inches in diameter and 11 mm. thick. The water tubes are of copper and about ½ inch thick. The Y downtake is 3 inches in diameter. There is a forced circulation maintained by an injector in the upper leg of the inverted Y. This may be briefly explained as follows: Water is pumped into the boiler at 330 pounds to the square inch. This escapes into the boiler through an injector nozzle, and as the ateam pressure usually required is 300 pounds, it follows that there are 30 pounds devoted to this circulation. The cold water coming in combines with the hot water, increasing the gravity of the water in the downtake, and down it goes, so that the water coming in is immediately taken to the hot tubes. The nozzle is provided with a apring which always maintains the 30 pounds difference in pressure. A very convenient apparatus is attached to the feed pipe, by which it is possible to see at a glance exactly how many pounds of water per hour are entering the boiler.

Over the upper part of the boiler there is a second system of smaller tubes, also of copper, 13 inch dlameter and 15 inch thick, constituting the feed water heater, which raises the temperature of the water to 250° F. In this way the products of combustion, having passed between the boiler tubes, are brought into contact with the incoming water before escaping.

The boiler will and does make more steam than can be used. Its weight, with its feed water heater, casing, uptake, furnace and water, is 1200 pounds, 200 pounds being that of the water itself. The fuel employed is naphtha of 72° Beaumé. This is heated in the gasoline boiler by a part of its own contents, and delivered to 7650 jets at a pressure of 50 pounds per square inch. The average contents of this boiler is about 40 pounds.

The gas, when generated, passes through the furnace and then out at the other end of the ateam boiler. It then enters the burner through an injector, and the fall in pressure from 50 pounds per square inch to 1 pound per aquare inch is made to do work in sucking in air. A damper shaped valve may be

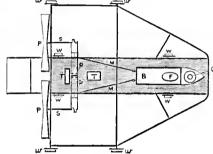

Fig. 3.—Plan.

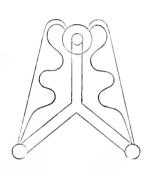

Fig. 4.-Vertical Diagram of Boiler.

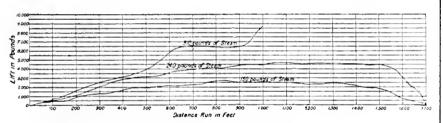

Fig. 5.-Diagram of Flight.

### THE MAXIM FLYING MACHINE.

the high pressure cylinder a differential pressure of 195 pounds, and in the low pressure cylinder 125 pounds. The cut offs are respectively 0.75 and 0.625 of the strokes. In the high pressure cylinder there is a very large clearance designed to prevent injury from water in case the machine, should pitch. The actual horse-power delivered to the screws is 363, when the engines are running at 375 revolutions per minute. Of this we (Engineering) are informed by Mr. Maxim, 150 horse-power are expended in slip, 133 horse-power in actual lift on acroplanes, and 80 horse-power in driving the machine, with its frames and wires, through the air. The thrust of the screws when the machine is moored is 2100 pounds, and when it is running it is 2000 pounds. We give these figures as they were supplied to us, omitting decimals. The total lift is something over 10,000 pounds, at a speed of 40 miles an hour, and with the scroplanes making an angle of about 7.25° with the horizontal.

From the Engineer we take the following and also engravings 3, 4, 5. The success which recently attended steering impossible, and the machine got out of line with the track. The left hand front wheel also got free, and the machine charged against one of the timber supports carrying the right hand guard rail, tore up the rail, which is simply a 9 x 3-inch plank, and did very great damage to its own frame work. The ride was in this way brought to a sudden stop, and it will be several months before it can be renewed. The total weight of the machine, including 600 pounds of water, 200 pounds of naphtha and three men, was about 8000 pounds.

pounds.

Fig. 3 shows the deck plan of the machine. P P are the two propellers mounted on the shafts S S, to each of which motion is given by a compound steam engine. B is the main boiler, delivering steam through the pipes M M. G is the gasoline boiler, which is kept charged with about 40 pounds of naphtha by a pump, p', automatically regulated, the supply being contained in the tank T', while the larger tank, T, contains the feed water, which is fed into the boiler by the feed pumps p. W W W W are the wheels which run on the track before the machine has

turned about so as to vary the air at will-full on blows the gas out, while with it closed a great cloud of black smoke is given off at the smoke stack. With a proper adjustment the tlame is a purple white and about 22 inches high.

The engines weigh 600 pounds, so that Mr. Maxim obtains more than 1 horse power for every 2 pounds of weight—which is in itself an achieve-The pumps weigh 100 pounds; the high pressure pistons are 5.05 inches in diameter; the low pressure 8 inches in diameter by 1-foot stroke. The high pressure cut off is at 0.75 of the stroke, that of the low pressure being at 0.625. The relatively high pressure in the low pressure cylinder is due to its earlier cut off, and to a large clearance in the high pressure cylinder which is allowed in order to protect the cylinder from injury by water in case the machine should pitch. The ports and steam passages are unusually The engines move with very large. The engines move with very little friction, owing to their exceeding lightness. The piston speed is estimated at 750 feet per minute.

An instance of the great care and

forethought with which the engines have been planned lies in the construction of the big ends of the connecting The bolts which secure the brasses are hinged on the end of the rod in such a way as to allow of any slight bending, in the event of the atrain on the frame work of the machine bringing the crank out of line with the cylinder. It must be remembered that the engine, cylinders, frame and rods are entirely made from sheet metal, so that there is every possibility of there being necessity for some such safeguard as this. By-pass valves are provided, so as to allow live steam to pass directly to the low pressure cylinders; thus if the steam pressure in the boiler should mount too high it will blow past the high pressure cylinders, instead of blowing off into the air, and the fall in pressure is made to do work in the exhaust from the high pressure cylinders, drawing the steam from the high pressure and driving it into the low pressure, thus causing more direct pressure on the low pressure than back pressure on the high pressure. In this way the engines may be made to develop fully 400 horse power.

The diagram given in Fig. 5 shows what occurred on the day of the dis-The ordinates show the lifting effort in pounds, the abscisse the distance in feet traveled. It will be seen that the dynograph ceased to record after a distance of 1000 feet had been covered. In other words-this was the point when the crash came.

All the frame work of this extraordinary machine is composed of hollow tubes. The exhaust from the main engines is conducted through them out at the back of the main acroplane, in order that the steam may not injure the can-The condenser is not yet a perfected detail. It is a luxury, and not essential to the flying properties of the machine. It is, of course, receiving Mr. Maxim's attention. The horizontal angle of ircidence in flight is to be maintained by a "gyrostat," which consists of a gyroscopic wheel, rotating, approached by universal joints, and conauspended by universal joints, and connected with the two horizontal accoplane rudders, so as to act upon them instantly - through the well-known property of the gyroscope to continue rotating in the same plane—in case there is any tendency of the machine to deviate from the angle of incidence. The whole of the apparatua is atayed by dlagonal wire ties.

In conclusion the Engineer states: What Mr. Maxim has done has been to, so to speak, make a bird that does not know how to fly. We believe that not know how to fly. We believe that the safe use of such a machine will always depend on the skill of the driver. Because we put on skates we do not expect to be able to skate right away. No more can we expect Mr. Maxim to be able to control this machine efficiently until he has had years of prac-In the same way there are birds tice. In the same way there are birds who tly well and birds who tly badly. This bird has only just been hatched. Let us hope that Mr. Maxim will not come to grief, "Icarus like," before he is fully fledged.

### Trade Education Abroad.

Most of the European countries have been shead of the United States in providing trade and technical education, as distinct from mere manual training, for their youth. Very generally the subject has been recognized as having such an important bearing on the national prosperity that trade schools have been established either directly under government auspices or else with the aid of the State. The latter condition prevails in Great Britain, where so-called technical achools-which generally embrace what are in this country regarded as tradeschools pure and simple-are springing up on all sides. In Germany, France, the Netherlands and Switzerland the governments are also paying considerable attention to the subject. Recent consular reports to the State Department from the two last named countries contain notable testimony to the efficacy of the system of training thus given in turning out an intelligent and educated class of crafts-

### Swiss Schools.

The Swias, in particular, are famed for their manual dexterity, and their country is noted for its educational advantages in general. Probably no nation, in proportion to its territory, has so many industrial and technical schools. They receive both national and private assistance. The federal government, we learn, gives subsidies to not less than 157 of these institutions, more than \$330,000 having been thus paid out for their support during the past seven years, while municipal and private subscriptions have raised the total to above \$1,500,000. Thus the Swiss expend nearly \$300,000 a year to aid their boys in learning a trade, and this, with a total population of only 3,000,000. Above 17,000 young Swiss are attending these trade schools at the present time. The result, as it has been said, is that "young men now learn trades in Switzerland with zeal, looking for the same honor and the same reward that is anticipated from the adoption of professions. The basis, however, on professions. which they build is more solid, the aim more elevated than ever before." The Swiss special training has elevated the trades and raised the mechanic in the eyes of the world as well as in his own A Swiss who has gone through a full trade school course understands his calling perfectly and has no trouble in securing employment at the highest Wages.

### Trade Schools in Holland.

In Holland there are 18 genuine trade schools. The manual training school, which aims only to impart to the pupil a general manual facility withour reference to his subsequent vocation, such

as is so largely in vogue in the United States, is there virtually unknown. The one purpose of the Dutch trade achools is to "train efficient mechanics." Employers of skilled labor are the most pronounced advocates of the achools, which, they assert, improve the grade of skilled labor, making it not only more profitable to the employer, but more marketable. All the schools were established and at first maintained by private enterprise, but all except one are now sustained in whole or in part by municipal or governmental subsidy. The exception is the trade achool at Breda, which was founded by one of the earliest and most ardent advocates of the trade school idea in the world, Dr. Van Cooth, who at his death left a sufficient aum of money to endow it handsomely. With a population of only 22,000, Breda sends regularly 120 or more pupils to the school. The result in Holland has been, in the words of the report, that

"Employers agree in testifying that the work of the boy trained three years in the trade achool has a higher marketable value than the work of the boy who, deprived of the school privilege, has been compelled through poverty to learn his trade in the shop. One is an all-round mechanic, who has learned the 'why' of things; the other, a drudge, without resource of adaptiveness, whose work is, and always will be, purely perfunctory."

### A Belgian School.

At Charleroi, in Belgium, is an important trade achool, which was established by the Provincial Council in 1865, which has an annual government aubsidy of \$2605. The average attendance at the school is 934, and among the trades taught are joinery, blacksmithing, boiler making, masonry, molding, ateam fitting, &c. Belgium also maintains other schools of a similar nature, all of which have been found to be of the greatest benefit to the country at large.

### Trade Education in Austria.

In Austria the system of trade schools has been brought to a very high state of perfection. The Gewerbe Schools (the purely industrial or technical achools of the country) impart instruction in various branchés of trade, and, as we learn from a European technical journal, especial attention is devoted to such branches as may form a distinct specialty in the district in which each school is located. The pupils are, it is atated, scientifically prepared for their special manual calling far more satisfactorily than if an apprenticeship had been served in some ordinary workshop. Whatever the art in which the pupil is receiving instruction, whether in metal work, in engineering, or in carpentry, carving, molding or building, every effort is made "to impart to him a full knowledge of the why and the wherefore of what he is doing and the beat means of doing it." The consequence is that the pupils, thus trained, become masters of the trade they have studied in much shorter time and more thoroughly than could be the case under the old apprenticeship system.

The general consensus of opinion among those who have studied the question of trade schools, as illustrated abroad and in this country, points to the conclusion that such a means of definite industrial training is an absolute necessity under present day conditions if the American mechanic is to keep up to the high standard he has

hitherto maintained.

# PLUMBING and GAS FITTING.

### Montreal Master Plumbers.

The plumbing by-laws of the city of Montreal, which we published some time ago, with certain modifications, became law on July 1 last. As a result the Master Plumbers' Association of that city, which was at one time a very active and progressive institution, but had become dormant, has been revived and we may say amended and enlarged, taking into its list of members all master plumbers of good repute in Montreal and vicinity. The vicinity means a number of by no means small towns which are attached to the city proper as auburbs, but do not form part of territory covered by the city charter and are not affected by the city plumbing bylaw. It is intended to use the influence of the Montreal association in encouraging the formation of similar associations in the different towns throughout the Dominion of Canada and ultimately make efforts for affiliation with the United States Association, so as to cover the ground in the most complete manner. The following is the list of the newly elected officers:

President, J. Lamarche. First vice president, Jno. Date. Second vice-president, Alph. Cham-

pagne.
Third vice-president, H. Paddon. Secretary, W. M. Briggs. Corresponding secretary

French. secretary. Joseph Gibeau.

Corresponding secretary, English,

J. W. Hughes.

Financial secretary, P. Leclaire, Jr.
Treasurer, W. A. Stephenson.
The following committees were
elected, the first name being the chair-

Sanitary: J. W. Hughes, Jno. Wate, James Mattison, H. Sigouin, J. C.

Arbitration: P. Carroll, Alph. Demers, G. Yon, G. Rosser, H. Baillie. Auditing: J. Watson, A. Desforges, Theo. Jacotel.

Legislative: F. Brunet, D. Gordon, D. Ouimet, Jno. Burns, P. Leclaire, Jr. Apprenticeship: Wm. Brittan, E. C. Mount, A. Cardinal, J. Sadler, A.

Blais. The business of the association is conducted in both French and English, an interpreter being appointed for each meeting. The first regular business meeting was held on the 16th, and from the attendance, general interest and enthusiasm manifest on that occasion it would require no spirit of prophecy to predict that the Master Plumbers' Association of Montreal and Vicinity will speedily take its place in the front rank of the many associations of the kind that are now doing such excellent work throughout the United States and Canada.

IN ACCORDANCE with the recent law in regard to plumbing, the Board of Health of Melrose, Mass., have issued a notice to plumbers, requesting all persons engaged in that business to appear before the Board August 31 or September 1 for the purpose of registering and to obtain certificates.

# Gas and Gas Fitting.—VI.\*

BY J. W. HUGHES.

### Piping the Building.

We will now suppose the gasfitter arrived at the building, ready to set up his bench and begin operations. few minutes friendly chat with the foreman carpenter, who is generally in charge of the building at this stage, is in order to ascertain where to set his bench, as it will only result in loss of temper to find out after time has been spent in getting ready that you have taken space pre empted by some brother mechanic, or where you will be in the way of some operation of which you were ignorant. Avoid passages and doorways, and have an eye to convenience of handling your pipes and other materials with plenty of light and room.

your head-Having established quarters, take your plan and mark off the positions for the different light and other openings with chalk on the walls for brackets, and on floors for centers. The general hight for placing wall brackets on walls is 5 feet 4 inches from the floor. In hall or passages, 6 feet 6 inches, and in fitting the latter due regard must be taken of the hight of ceiling. The light should never be placed nearer than 2 feet clear of ceiling, if of plaster, and if of wood 3 feet at least must be allowed, and even at that distance a suitable shield must be suspended over the burner.

Next cut the different holes, chases in walls, notches in beams, and generally clear the way. Some architects will only allow pipes to be fitted on top of the heams in notches cut for the purpose. Said notches are generally cut close to the walls, or a bearing point of the beams, so as not to weaken the atrength of the building. In cutting notches cut them in line, using your chalk line, or anything handy, to serve as a straight edge, and be careful not to notch deeper than is actually necessary to allow the fitting of the pipe anugly, but not too tight, or so shallow as to allow the flooring to rest on the pipe. Where beams have to be the pipe. Where beams have to be bored use the same precaution to get holes in line, and avoid making them too large. A hole that will allow the buckles on a pipe to slip through anugly is right. Cut chases in brick walls, using a thin bladed sharp cold chisel, and cut from the top down, so as to avoid smashing the brick. The operation is shown in Fig. 16, A being the chase cut and B B the lines on the wall to work to.

Having all holes and chases cut it is next in order to begin the measuringbut I may say, before going into that question, that in many places the gas pipes are run below the beams, in the space formed by the laths when nailed to the furring. This, in my opinion, is the best plan, causing less disturbance and cutting of the structure, and reducing the risk of the pipes being disturbed by subsequent operations. A

sectional view is shown in Fig. 17, A and B being the finished and rough floors respectively, C the beams, D the furring and F lath and plaster, G the gas pipe and H the drop nipple through the center piece. When this plan is adopted great care must be taken to properly secure the drop nipples to avoid having the weight of the gasoliers dragging on the laths. Hundreds of houses in the writer's town are fitted up according to the foregoing method; in fact, it is the universal plan, and there are no practical objections to it, although the question is sometimes raised "How are you going to get at the pipes if they go wrong?" Well, properly fitted pipes don't go wrong, so there is no sense in raising objections of the "if" species.

#### Measuring Pipes.

Before taking measurements the fitter must know what sizes and lengths of pipe are correct and allowed. The gas companies in the different cities have different rules.

As an example of the practice in the United States respecting sizes of pipes, I give the following table from the Regulations of Washington, D. C., which were adopted in February, 1893:

Size of	Greatest length allowed,	Greatest num-
pipę.		ber of burners.
lneh.	Feet.	Der or Darmerer
86	6	1
16	20	0
1/9 3/4	40	02
174	60	35
11/4	80	60
	150	100
2 2	200	200
61/	300	300
21/2	450	450
4	600	750

Smaller pipe than ½ inch shall not be used for ceiling outlets, except for lighting halls, pantries, washrooms, bathrooms and kitchens.

The following is an example of Canadian practice:

Size of pipes.	Length allowed.	Number of openings.
Inch.	Feet.	Obeninks
1.4	б	j.
67	20	3
728	30	G
5.7	40	12
3774	50	20
14	70	35
11.6	100	60
110	150	100
179	200	200
917	300	300
÷73	450	450
2	60)	750
1	0	

There are a number of plans in use among gas fitters for their guidance in taking measurements. Some measure length of pipe only, some pipe and fit-ting, cutside to outside, but the best plan is to measure from center to center, center of one fitting to the center of the next-or center to center of holes. In a complicated building there is an advantage in making a rough pipe plan as the measurements are taken, but in most cases simply putting down the measures with the size and kind of fit-ting is all the fitter needs. If there are a great many measurements it is a guide to number the lengths, not necessarily all of them, but making a figure or mark from time to time to serve as a key or reminder. Some measurements only require to be taken once and simply repeated under the same head, such as

<sup>\*</sup> Copyrighted, 1894, by David Williams.

upright pieces from a running or horizontal main to a bracket. Drop nipples, or wall nipples, also come under this head, but any plan to avoid going over the ground more often than is necessary will serve the same purpose. There is

required for the grate fire in the dining room, also the stove in kitchen, with branches taken off and rising to supply grate fires in front and back parlors on ground floor, Fig. 19, and grate in first floor sitting room, Fig. 20. The meters place with a 4 inch plpe continued up to front parlor, where it is again divided, or branched, a 1-inch pipe being run to supply front parlor fire place, and another of same size continued up to supply first floor sitting room fire place.

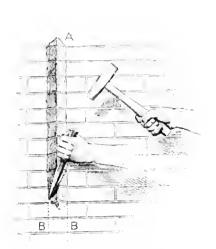

Fig. 16.—Cutting Chase in Brick Wall.

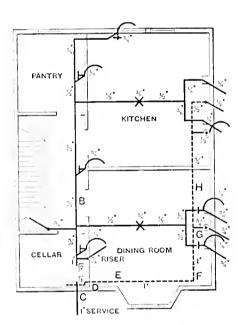

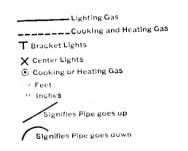

Fig. 18.-Plan of Basement.

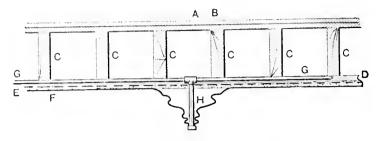

Fig. 17.-Running Pipe Below Floor Beams.

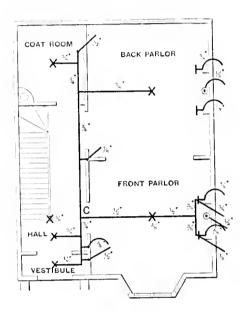

Fig. 19.-Plan of Ground Floor.

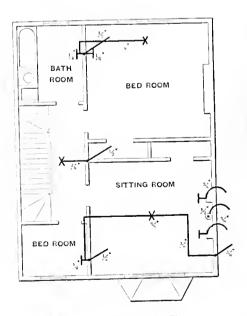

Fig. 20 .- Plan of First Floor.

GAS AND GAS FITTING.

no rule without its exceptions, and this

is where brains come into play.

Figs. 18, 19, 20, 21 and 22 are plans of the different flats of a house with the gas pipes and their sizes marked on. Two sets are shown, one with dotted lines, Fig. 18, which supplies the gas

are shown on basement plan numbered 1 and 2. The line of pipe for heating gas begins at meter No. 1, crosses the dining room and turns toward the kitchen. Opposite the dining room fire place a 4 inch branch is run off, which is divided to supply dining room fire Continuing from the point opposite basement dining room chimney, where its branch was taken off, the pipe is reduced to  $\frac{a}{2}$  inch and run to supply cook stove in kitchen with  $\frac{1}{2}$ -inch branch, and  $\frac{1}{2}$  inch run up to supply the fire place in the back parlor. Where on

the plan branches continue up to a story above, they have been shown by a line run at an angle; when the pipe goes down from any particular story the fact is shown by a curved line, as explained in the legend below, Fig. 18. Pipes shown in solid lines, Fig. 18, are for lighting gas.

The plan is sufficiently clear and self explanatory not to require a detailed description of all its parts. But to give the reader a fair start in studying it a portion of basement will be described. Starting at meter No. 2 with a 1-inch pipe, It is run as far as where the \$\frac{4}{4}\$ inch riser is taken off to supply the upper flats, the fitting used being a 1 x \$\frac{4}{4}\$ x \$\frac{1}{4}\$ inch T; then a short piece is run with

following, the lengths being of course fictitious and not actual measurements, and the fitting shown as they come in the plan:

l inch.	3, inch.	lý inch.
C 1.0 ell and cap. D 2.6 ell. E 10.0 ell. F 4.0 1 x 34 x 34 T.	G 2.6 k <sub>2</sub> x 3 i T. It 10.0 x <sub>4</sub> , \(\frac{1}{2}\) x \(\frac{1}{2}\) T	, 10 ell. -06 cap,
		. i 0 ell.
the first of the first training		2,6 eH.
		30.0 eH.
		. 1.0 cap.

To make the foregoing still clearer a portion of the pipes on the plan have been

#### Cutting the Pipe.

The holes being cut and the positions of openings clearly marked on walls, no mistake can be made, especially if the method be adopted of measuring from center of hole to center of hole every time. The measurements being all taken, hang up the plan close beside the vise where it can be seen without unnecessary trouble, and you are ready to begin getting out the lengths, the helper picking out the fittings as called for. The fittings should be picked from plan and a list of them made out so that they may all be selected in the ahop and brought to the building. A tape line is handy for measuring at the

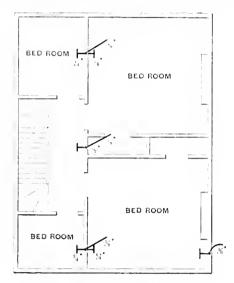

Fig. 21.-Plan of Second Floor.

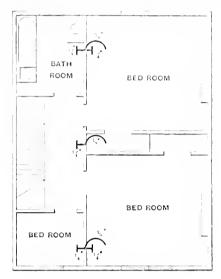

Fig. 22.-Plan of Attic.

Fig. 23.—Fastening Pipe for Side Light.

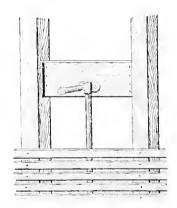

Fig. 24.—Board Between Studding for Holding Nipple.

Fig. 25.—Fastening to Brick Work.

### GAS AND GAS FITTING.

a \(\frac{1}{4}\) x \(\frac{1}{6}\) inch T, from which is taken the pipe for bracket light for cellar, which drops down, as shown by the curved line. Continuing on \(\frac{3}{4}\)-inch, there is a \(\frac{3}{6}\)-inch branch run up to supply the light on newel post of stair on ground floor. Then is taken off \(\frac{1}{3}\)-inch branch which is run across the dining room with a \(\frac{8}{3}\)-inch center drop and continued in branches, as shown, to supply two bracket lights on the chimney breast of dining room, and run up for the same purpose to front parlor chimney. And so on for the different main runs and their branches through the plans.

A set of measurements as taken by the fitter for, say, the heating gas, employing the plan of putting the different sizes of pipe under their proper heading for sizes—that is, not mixing them up—and designating the size of each piece aeperately, would look like the

designated by letters C, D, E, F, G, H. A verbal description of this portion of the set of measurements is as follows: C shows the piece that will drop through the celling at meter, having a cap on one end which will be removed when final meter connections are made and an ell (elbow) on the other end, making the turn in which pipe D will be screwed. D also has an ell on it as well as E. F again changes the direction toward the chimney, and is, say, 4 feet long, having on it a T which changes the size from 1 inch to \( \frac{3}{4} \) inch in size and has on it a T\( \frac{1}{4} \) x\( \frac{3}{4} \) inch for supplying the fire place in dining room, and so on through the whole plan. The letters are used simply to make the method understood by the reader. The resourceful fitter can adopt any plan that is most to his taste, once he has grasped the general idea.

vise, and another handy scheme is to have a strip of wood at the side of the bench and laid off in feet and inches, or the side of the bench itself can be so Cut all the same sizes of pipe marked. first and before taking out of vise, screw on the fitting required, first looking through the pipe to be sure that it is clear and examining the thread to make certain the cutting of pipe or thread has not split the end of pipe. Before screwing on the fitting run around the thread with the red lead brush, the red lend being mixed to the consistency of cream. Do not put red lead inside the fittings if small. For fittings 1 inch or over a little lead put inside the fitting does no harm, but for small pipes it is best to avoid the practice. As the pipes are cut and the fittings screwed on they can he laid aside preparatory to being carried to the different floors where they are to be fitted. In screwing the

different lines up in final position be careful not to injure the pipes with the tongs, and avoid forcing the pipes too far into the fittings. The pipes being all in and capped, before putting on the final fastenings apply the test pump and make sure the job is tight. Then make the final fastenings, taking great care to have the nipples stand out perfectly horizontal and the drop nipples set plumb. Where side nipples are fitted for an ordinary light, single burner bracket pipe hooks, as shown in Fig. 23, for holding the uprights are all that will be required.

On brick walls use wing elbows and screws. For centers use wing tees or elbows, as the case may require. Where the nipple or drop comes between studding or beams, nail in a piece of board to which to secure the outlet, as in Fig. 24. On brick work let in a piece of wood, removing a brick and wedging in a block of wood in its place, as shown by the shading in Fig. 25, being careful to have the piece thoroughly wedged in, so that it will not work loose on drying. Driving large nails tightly between the wood and brick is

a good method of doing this.

Remember that nipples and drops may have to be taken out for cutting, and when the fixtures are being put up see that they are so arranged that this can be easily done and that the pipe to which they are attached will not spring away. A great deal of removing and cutting of nipples can be avoided if care is taken to allow the proper projection of nipple beyond the line of finished plaster or wood work. About 4 inch will suit for most fixtures. In some places bent pipes are insisted upon instead of a fitting and nipple or drop. When this is done the greatest care must be taken to see that the projection beyond the finishing is just right, as there is no acrewing out of the nipple under such circumstances.

Having fastened all pipes apply the pump for the final test. If tight, look your work over carefully and pack up for the next job.

### TRAPS AND VENTS.

Joseph II. Sowden has fitted up an establishment at 518 Main atreet, Vincennes, Ind. Steam and hot water fitting and plumbing are specialties of Mr. Sowden.

Kennedy H. Stiveson & Co., Kittsning, Pa., use the Aeme instantaneo is water heater in connection with a plumbing system to supply hot water at this season, when the cooking for a family is done with gas, gasoline or oil atoves.

THE FIRM of Wyman & Van Orden, at Spring Valley, N. Y., have been dissolved, and Mr. Van Orden will continue the plumbing business at the old stand.

JOHN H. BEAM, Phillipsburg, N. J., finds the sale of the Perfect gas controller a profitable branch of his plumbing business, as his customers report a very substantial saving of gas as well as a better light, when the pressure on the burners is held at the proper point.

The Brownhill Company, 838 Broadway, New York, are finding a foreign market for their Perfect gas controller, which is establishing a reputation as a pressure regulator and gas saver, a large shipment having recently been made to Brazil. They have also established an agency at Brussells, Belgium, and the controller is now being shown at the Antwerp Exposition.

The condition of the closets at the Academy, at Dunkirk, N. Y., were condemned by the health officer and plumbing inspector as improper in their construction and operation. At No. 3 the ventilation of the closets was condemned. The new annex for No. 3, situated on the triangular lot bounded by Lion, Smith and Sixth streets, was condemned on account of the plumbing, and will not be used until repairs are made.

J. S. FULLER, Providence, R. I., finds the Acme instantaneous water heater one of the most popular plumbing fixtures in his city that he has introduced. He recently placed an order for three with the Instantaneous Water lieating Company of New York.

PLUMBER ADDIS, Plainfield, N. J., has associated his son, W. H. Addis, with him, and will open a modern plumbing showroom at an early date.

GEORGE TAYLOR and JOE HILBORN, Bueyrus, Ohio, were in Toledo last week buying stock for their new plumbing establishment.

The plumeing firm of J. J. Couglin & Co. of 407 Main atreet, Albany, N. Y., during their short existence of six months, have already built up an excellent business in gas and steam fitting and all kinds of plumbing.

RANDOLPH & CLOWES, Waterbury, Conn., are sending out some handsomely printed sheets of their new line of lavatory legs. The sheets are 23 in number, printed on fine paper, the pictures being half tone engravings, showing the supports on a black background. Various styles of spiral work and a variety of other handsome designs show straight and offset legs terminating in plain and ornamented feet, claw feet and dolphin heads. Some of the legs have onyx tubes, some are shown with aprons and others without. A plumber should have little difficulty in pleasing an esthetic customer from this line.

The CITY FATHERS of Syracuse, N. Y., with due propriety, referred the contracts for heating, ventilating and plumbing the four new school houses back to the Board of Education, requesting that it first obtain the approval of the Plumbing Board of this city to the specifications of the contract.

IF THE WORK of refilling the streets after making gas or water connections is not properly done, at Toledo, Ohio, the party doing it can be located, and his license will be revoked by the department under which he does the work. That authority is now vested in the several departments, and they have promised to see that it shall be exercised in future, if the Street Commissioner does his duty in reporting the facts.

EATON, COLE & BURNHAM COMPANY, manufacturers of plumbers' and fitters' supplies, have just completed an addition to their works at Bridgeport, Conn. The new building is situated at the corner of Water street and South avenue, and is distant about half a block from the main factory. The addition is 75 x 148 feet, two stories and basement, built of brick, and will be used as a warehouse for finished products. The New York store of this concern has been discontinued, and in future shipments will be made direct from factory. An office, however, is retained at 61 Beekman street, New York City.

O. II. NORTHROP of East Hampton's L. I., N. Y., for the past four years with F. E. Grimshaw of that place, will shortly open a jobbing shop for the carrying on of plumbing and sheet metal work. Mr. Northrop was with the Seth Thomas Clock Company, Thomaston, Conn., for four years previous to coming to East Hampton.

THE WALTHAM, MASS., BOARD OF HEALTH held a meeting last Monday and 28 plumbers were registered according to the provisions of the recent law, which makes registration necessary. A number of house owners were notified to connect their places with the sewer at once, as complaints had been made to the board.

A convenient rule for tinners, plumbers, steam fitters and all mechanics who work from plans is made by the Stanley Rule & Level Company, 29 Chambers street, New York. It is the usual 2-foot rule with the inner edge of all four of the 6-inch sections beveled, and on this space are scales of  $\frac{1}{5}$ ,  $\frac{1}{5}$ , and  $\frac{1}{3}$  inch to the foot, with smaller divisions at one end of the scale. They also make a pocket level that could be used with advantage to determine the fall of gutter, the pitch of a soil pipe and to avoid air traps in pipe fitting. A considerable job of engineering can be done with a rule and a good level.

J. C. HARTFORD & Co., 57 Dearborn street, Chicago, have issued a catalogue and price-list of the Hartford Vent sewer gas trap. This is a form of trap in which the full size of the passage is preserved as in the common S-trap, so that it is self-scouring, but in addition the trap is enlarged at its discharge end sufficiently to admit a vent pipe which extends downward behind and below the seal and is suspended directly over the discharge pipe. There is thus no accumulation of grease or aediment, while siphoning is prevented and the sewerage system is ventilated. Various forms of this style of trap are shown in the catalogue, such as aink, lavatory, urinal, &c. The lavatory traps shown are of various designs, comprising brass traps with removable vents, full brass traps with wall and floor plates, traps with vent to wall and slip joints, traps with waste to wall, traps with off sets, &c. An interesting illustrated treatise on sewer gas traps is inserted in the catalogue, in which a comparison is made of different methods of maintaining

A CALL is about to be issued for a meeting of the plumbers of Union County, N. J., for the turpose of forming a master plumbers' association. The meeting will be held at Elizabeth some evening, not yet set, next week. The plumbers of Plainfield, Westfield, Roselle, Summit, Cranford and Elizabeth have signified their interest in the association, and it is expected that National President John Mitchell of New York will address the meeting. State Vice-President John Hickman of Paterson and Alexander Don of Newark will also be present.

THE MASTER PLUMBERS OF ALBANY, N. Y., held their annual clam bake last week, which was in every acrase a highly eujoyable affair. Their wives, children and frienda were in attendance.

A PLUMBER has been fined at Brockton, Mass., for failing to comply with the plumbing laws. He refused to file plans of his work and to test it according to law.

THE INSPECTOR OF PLUMBING at Salem, Mass., says a local paper, is kept

busy just now, and while the new ordinance makes the cost of plumbing more than formerly, the result is better than without any ordinance. It has been suggested that the ordinance be repealed. This cannot be done, as the law requires that some rules and regulations shall be adopted. There may be a modification of it. One good result is that inferior plumbing in a cheap class of houses cannot be done. The law is the same for all dwellings, and it is more beneficial to the health of the occupants of the houses.

The Lyman & Kellogg Company have been incorporated at llolyoke, Mass., under the State laws, with a paid in capital of \$25,000. The members of the company are Charles P. Lyman, J. E. Kellogg and W. C. Livermore, and the firms of C. P. Lyman and Kellogg & Co. have been united in the new company. The place of business will be 139 and 141 Msin street, and a general furniture and plumbing business will be done. Mr. Lyman will have charge of the plumbing department and mill work and Mr. Kellogg will mauage the furniture department. The officers will be: President, C. P. Lyman, treasurer, W. C. Livermore; directors, C. P. Lyman, W. C. Livermore and J. E. S. Kellogg.

Chas. H. Morrow, secretary of the Board of Civil Service Examiners of Gloucester, Mass., issues a notice that the board will soon convene to select a plumbing inspector.

A notable shipment of shafting and pulleys was recently made by the Rice Machinery Company, 166 to 174 South Clinton street, Chicago. It was consigned to the Northwestern Coal Railway Company, Superior, Wis., for use on their coal dock. The items of the shipment are as follows: One piece of 5½ inch shafting, 7 feet long; one 5½-inch, 17 feet long; six 4½ inch, 24 feet long; eleven 4½-inch, 24 feet; six 4½-inch, 24 feet; four 4-inch, 24 feet; four  $3\frac{a}{4}$ -inch, 24 'eet; four  $3\frac{1}{4}$ -inch. 24 feet; four  $3\frac{1}{4}$  inch, 24 feet; four 3 inch, 24 feet; 47 pairs of flange couplings; 40 friction spools, 22 x 15, and 40 friction spools, 15 x 12. All are to be coupled in one continuous line 1250 feet long, driven at one end by a 500 horse-power rope drive. The equipment comprises two 500 horse power engines, so that one can be held in reserve or both be used if occasion requires. The shipment required four cars and comprised a total of 175,000 pounds. One gondola car was loaded with 47,110 pounds.

Excavation has been begun for the power house of the Metropolitan West Side Elevated on its line between Throop and Loomis streets, The building will be 600 feet long, 90 feet wide, and have an average hight of 70 feet. Only one half of thia, how-ever, will be put up at the present time, the other being added as the extension of the company lines demands an increase of power. It will be of steel construction, with red brick walls and slate roof, and will be fire proof. The plans are to make it the model power station of the country. The cost will be \$300,000, and it will be com-The cost pleted December 1. The engine room, which will be 300 feet long, will afford apace for eight engines, each capable of producing 2000 horse power in electrical current. The battery of boilers will be in a separate house and will consist of 36 boilers of 300 horse-power each.

### New Publications.

PROGRESS IN FLYING MACHINES. By O. Channte. Size 6 x 9, 308 pages. Illustrated. Published by the American Engineer and Railroad Journal, New York. Price, \$2,50.

It is seldom that a book dealing with a scientific subject appears at a more opportune time. Aeronautics is attracting wide attention in all civilized countries; earnest effort is being made to formulate the principles that must underlie successful flight; study of the attempts that have been made is being prosecuted carefully, and, most important of all, experiments are in progress which lead to the belief that the flying machine is a possibility, perhaps of the near future. Mr. Chanute's book, therefore, is a most welcome contribution to the subject, since it gives a complete historical review of the efforts of inventors to accomplish tlight with apparatus. It needs but a glance at the work to appreciate the fact that the author has searched the field thoroughly and collected data of the greatest value He has gathered all the records of such experiments which were accessible, and has endeavored to show the reason for their failure and to explain the principles governing flight. His study has led him to believe that we may eventu ally fly through the air.

The book is divided into three general heads: Wings and Parachutes, Screws to Lift and Propel, and Aëroplanes. The legends of antiquity are very properly discarded, as they have no value, but merely indicate that artificial flight early appealed to the imagination of man. Under each head the experimenta are arranged chronologically and drawings showing the peculiarities of construction of different types of machines are reproduced whenever possible. It is under the title "Aëroplanes" that we find the most interesting particulars, since it is in this direction that the most promising work is now tending. The author's opinions and criticisms are presented while describing the experiments, this being, in his opinion, a better plan than to offer them in a series of abstract statements and propositions.

The following table, based "upon experimental data of projections.

Comparative Efficiency of Various

appropriated to the motor:"

perimental data of weights actually sustained, indicates that aeroplanes are

probably the best form to experiment

with, because they admit of a larger

proportion of the whole weight being

Kind of apparatus.	l'ounds sustained per horse- power.	Prop'rtion available for motor.	Resulting possible weight of motor per horse- power Pounds,
Screws	45	1/3	15
Wings	100	1/4	25
Aëroplanes	100	1/2	50

"This also indicates the possibility of success in artificial flight, with motors weighing 10 or 15 pounds per horse-power, provided that the remaining problems be also solved; but it must not be overlooked that more power will be required in rising from the ground than in horizonal flight, and that the actual proportion of the total weight available for the motor, although conservatively estimated from the best data available, is still a matter to be proved by experiment."

In an appendix the experiments made by Herr Lilienthal in 1893 are described fully. The book closes with that most essential adjunct—a very copious index.

Award for Sheet Metal Tools.

The Niagara Stamping & Tool Company, Buffalo, N. Y, have received an award for their exhibit of tinners' machines and tools, thears and presses at the Columbian Exposition, the text of which is as follows:

Distinguished for convenience in operating, accuracy and careful workmanship, pleasing appearance and excellent finish. The machines have large capacity and are well adapted to the purposes for which they are designed and constructed. The machine for edging sheets of metal shows improvement in the gauge mechanism, which provides for quick and precise gauging of edges of different widths, and in the adjustment of the wing or folding bar for round edges. The gauge is affixed to a slide moving in the extension, and is operated by a link from the adjusting screw on the side, the width of the lock being indicated on a dial. For forming round locks for wiring purposes the folding bar is lowered. The bench machines show improvement in construction. Their parts are made on the interchangeable plan; the cases are milled and the gears are machine cut.

The machine for tacking down seams on round or other shaped pipes, or on bodies of tinware, shows improvement. The Niagara machine has a round horn which permits of grooving pipea as small as 2 inches in dismeter. The horn has grooves into which the seam can be pressed by means of a flat roll, thus putting the seam at the inside of the work; while the machine is also adapted for outside grooving when grooved rolls are used bearing on the flat surface of the The Queen City machine is convenient in operation. As the rolls travel over the work a flat roll follows a grooved roll and tightens down the seams. Both these machines have devices for quickly adjusting them to various thicknesses of metal. The tools used in canning factories, such as soldering cylinders, cappir g steels, solder cutters and molds. soldering coppers and fire pots for various kinds of fuel, are well designed and finished and admirably adapted to their purposes. The foot and power squaring shears are of graceful and simple designs, with ample weight and strength to do the required work without strain. These shears are adequately supplied with provisions to take up wear in guides and knives. The knives are ground perfectly true, so as to fit the cross head and bed without lining. The power presses for stamping sheet metal have effective clutch mechanism with positive stop.

The Treasury statement of exports for the first seven months of this year shows a marked decrease in the export movement of wheat, rye, oats, petroleum residuum, naphtha, taltow and canned beef, as compared with last year. Other breadstuffs, provisions and oils exhibit a considerable increase over the same period of last year.

The dire predictions of the Eastern peach growers, made in the spring, appear to have been verified this year. The peach crop is pronounced to be an utter failure.

## STEAM AND HOT WATER.

### How Shall Radiators Be Vented?

From M. M., Pennsylvania.—In reply to A. P. of Pennsylvania, in The Metal Worker August 4, would say: The ordinary valve on a direct radiator is always more or less trouble, especially on hot water work. It cannot be opened without letting some water on the floor, and is liable to be accidentally opened by rubbing or leaning sg4iu3t it without being noticed, and I have seen them broken off by pushing the furniture against them, &c. The fact that they require attention is enough to condemn them. The vent pipe over the expansion tank is much the best way; it is always at work and requires no attention at all, and if the work is properly planed does not cost any more to put in. Entering the flow pipe in the top of the radiators and venting the system of piping is a much better way and can most always be done at very little additional cost. It may also be the means of preventing the blowing of the water out of the expansion tank, should the apparatus be allowed to get too hot. If the system of piping is ventilated it does away with the third connection at the radiator.

### Hot Water Heating from Steam Boiler.

From C. E. K., New Orleans.—I would like to know upon what theory the radiator shown by W. H. Page in The Metal Worker of July 7 derives its circulation.

According to that sketch the hot water from the boiler flows downward to the radiator, and the cold water from the radiator rises directly to the boiler—a circulation rather contrary to that obtained usually. Of course the steam pressure being practically equal upon both feed and radiator, no forced circulation can be obtained from that.

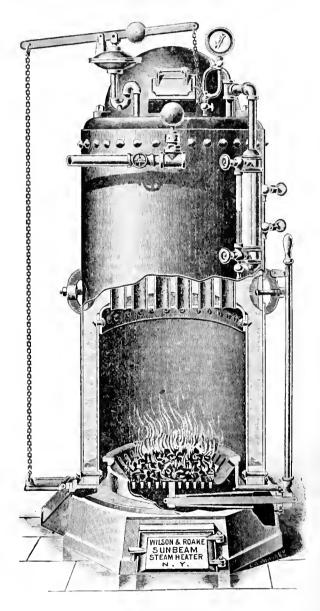

### The Sunbeam Boiler.

In the accompanying picture a sectional view is shown of the Sunbeam house heating boiler recently patented and being manufactured by Wilson & Roake, 261-263 Front street, New York. The boilers are made of flange steel having a tensile strength of 60,000 pounds, and each one is tested by a cold water pressure of 150 pounds. As will be seen by the cut, it consists of an outer shell and an inner shell, the lower part forming the fire chamber and in the front of which is the feed door. The top of the Inner shell is covered with a water tight plate, from which tubes run to a similar plate connected with the outer shell, the space between being filled with water. The radiant heat of the fire strikes against the inner shell and the plate at the top, and the hot gases pass up through the tubes to the chamber above, from which they find exit through the smoke collar. The boiler rests on a substantial base, which forms an ash pit and supports a grate that is easily operated by a lever

and which can be readlly removed or replaced. To the boiler is attached the usual water gauge, safety valve and steam gauge when used for steam, and an automatic draft regulator is supplied that is employed when the boiler is used for either hot water heating or for steam. An asbestos lined galvanized cover is furnished when desired. The boiler is made in six sizes with grates

catalogue of the boiler has just been printed which gives full details and description and can be had on application.

A MATHEMATICIAN of Massachusetts, who, according to a local paper, feels that the dietates of scientists are becoming rather expensive in these latter days, has been doing a little figuring on

The Sunbeam Boiler.

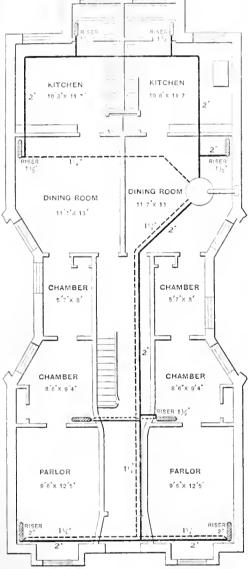

having respectively  $1\frac{1}{6}$ , 2,  $2\frac{1}{2}$ ,  $3\frac{1}{4}$  and  $4\frac{\pi}{4}$  equare feet and rated to carry 233, 400, 600, 800, 1000 and 1200 square feet of surface in direct radiation. The respective horse-power of the boilers is given as  $2\frac{1}{3}$ , 4, 6, 8, 10 and 12, and their strength of construction permits of their being use 1 for power purposes when not in use for heating. One of the boilers is in use where it pumps the water supply for the building, a system of valves and piping shutting off the heating system while the high pressure work is being done. A new

the subject, and he says that to introduce into school rooms the amount of sir per minute that some plans call for, and to bring it in through the prescribed conductors, would create a current against which no man could stand, and that the result would be to blow teachers and pupils into the corners of the rooms and hold them there until the ventilation was shut off. Again, he finds that according to scientific requirements it would be impossible for a person to live in his dining room long enough to finish a meal, and as neither

he nor any of his family nor guesta has ever been suffocated, he is naturally led to question whether this "cubic feet of air" business is not sometimes carried to an extreme, especially where the public has to foot the bills.

### Heating a Tenement.

To those of our readers who are distant from the larger cities the method of heating a tenement house will be interesting. As a rule in such houses there is a janitor who attends the heat-

Heating a Tenement.

ing plant and does many other things that are usually done by the family or servants. The illustration shows the plan of some houses built by F. Guggenheimer in New York, and in which Albert Cryer & Co., 85 Centre street, New York, installed the heating plant, using a Victor steam boiler. Only the first floor plan is given, as each of the two floors above is exactly the same, except that the parlors are a little wider, as there is no entrance hall. From this it will be seen that the homes of six different familles are heated from one steam plant, and the labor and care of the fire avoided. The boiler is at the rear of the building and connects with the chimney, as shown. A 2-inch steam main runs from the top of the hoiler to the front of the building with 11 inch branches to risers at each side, which feed the radiators in the chambers on

At the front the main each floor. branches and runs to a 2-inch riser, which feeds the parlors on each tloor. From the bottom of these risers a 1+ inch drip is taken to a point where they meet and run under the steam main back to the boiler, receiving a 1 inch drip from the chamber riser. A 2-inch main runs toward the back of the house, a 2 inch branch being taken to a 1½-iuch riser, which feeds the radiators in the three dining rooms above. The 2 inch main continues on turning across the house to the opposite side when it again turns and runs toward the front as far as the dining room riser. Two 11 inch branches are taken from the main to feed risers that run to the radiators in the bath rooms. The dining room riser at the end of this main is 1½ inch and supplies three radiators. From the bottom of the diving room riser a 1‡ From the inch drip runs directly across to the boiler and connects at the bottom. The mains are run with a fall to carry the condensation quickly to the drips and main returns. Automatic air valves are used on the job.

### HEATING NOTES.

THE ARCHAMBO, MARTIN & MORSE COMPANY, Minneapolis, Minn., recently filed articles of incorporation, changing the name to the Archambo & Morse, Company. In our issue of August 11 we referred to the change, but made a mistake in the new name of the firm.

T. C. Joy & Co., Tituaville, Pa., are distributing to the trade circulars relating to the Orient radiator for steam and hot water. The firm are now prepared to furnish this radiator in the following hights: 45, 39, 31 and 24 inches. The circular gives an illustration of the Orient, and on the back of the page is a full list of different sizes in which it is made, together with heating surface and other particulars.

L. W. GOULD, Vineland, N. J., has made a success of combination heating with hot water and hot air, having had 19 plants in operation last winter, in which the Boston heaters of the Magee Furnace Company were used.

SMITH & WINCHESTER COMPANY, Boston, Mass., are pushing their already well-known Winchester boiler for steam and hot water heating with characteristic enterprise. A catalogue just issued is a very neat piece of typographical work. It is a small pamphlet, bound work. It is a small pamphlet, bound in tinted covers, the front carrying a particularly handsome raised design.

The printing within the pamphlet is done in red and dark green ink, making very attractive text. Illustrations show exterior views of the boiler, while semitransparent illustrations indicate clearly its interior arrangement and construc tion. The boiler is also shown in brick setting and the grate is likewise sep arately illustrated. Toward the end of the pamphlet two tables give all dimensions, capacities and prices of both the steam and hot water boilers. They are both made in seven sizes. A telegraphic code follows, and at the end is a reference to several styles of radiators. Accompanying the catalogue is an amusing advertising device, on the back of which is the legend: "To produce a correct likeness of how a man who puts in a furnace instead of a hot water heating apparatus looks to the fitter, place opening to the lips and blow hard." Following these instructions the thin paper device expands and shows a likeness of a patient jackass, or, we might say, a speaking likeness, since the

mouthpiece brays in imitation of the veritable quadruped.

THE AMERICAN BOILER COMPANY. from their office, 84 Lake street, Chicago, are sending out circular letters to the trade under recent date. One of them directs attention to a revised price list which went into effect August , and gives the discount from the list. One of the lists relates to bot water heaters, and the boilers priced are the Perfect, Spence, Tropic (self feeding and surface burning), Bolton, Advance and Little Giant. As showing the wide range covered by the boilers of this large concern it may be stated that the capacities vary from 75 to 7500 feet. A second price-list relates to steam boilers, and includes the following apparatus: Florida, both self feeding and surface burning; the Soleil, the Ameriean and the Modern. Another circular letter which the same firm are distributing to the trade calls attention to the extensive assortment of steam and hot water heaters which they manufacture, and refers to the advisability of purchasing boilers from well established firms who thoroughly understand the business and can give their customers the treatment which they deserve.

THE STOVER HEATER COMPANY of Freeport, Ill., have issued a fine catalogue of their Cuba vertical tube boilers for steam or hot water heating. The Cuba is a self feeding self regulating boiler, built in vertical sections of cast iron tubes. The sections are bolted together through the water ways, thus providing for an equal expansion and contraction between sections and the rods connecting them. The sections are all planed so that they meet accurately and the joints are made tight by a packing which becomes hard and is stated to be as durable as the iron itself. The catalogue comprises 40 pages of interesting matter concerning the merits and advantages of ateam and hot water heating, together with tables of dimensions of boilers made and full particulars as to prices, &c. The illustrations given show all the essential points regarding the internal construction of the Cuba. The company have established a Chicago office at 89 Lake street, in charge of John Tubman.

Notwithstanding the general complaint of dullness, F. Richter & Son of Milwaukee, Wis., report their trade improving in steam and hot water heating. They have just closed up three good ateam contracts, and in the first three days of last week sold five of their large sized sectional boilers. They also made a contract for heating Dr. Godfrey's residence now being erected at Lancaster, Wis.

The corn crop throughout the South is fairly good, though short in some sections, owing to the lack of rain and excessive heat.

The condition of land tenure in the United Kingdom is curiously illustrated in the Financial Reform Almanac. Says that authority: "Of the 72,000,000 acres in this country, 50,000,000 are owned by less than 15,000 persons, and of these 50,000,000 on less than 30,000,000 acres are owned by 1000 persons. It is estimated that, leaving out blocks of under an acre in extent, 180,524 persons practically own the whole of England, Scotland, Ireland and Walcs: that 10,000 persons own two-thirds of England and Walcs, 300 two-thirds of Scotland and 1900 two-thirds of Ireland."

# THE RETAIL STORE.

### The Crusty Bread Pan.

The accompanying illustration shows the Crusty round bottom bread pan, put on the market by the Niles Mfg. Company. Niles, Ohio. The special advantage claimed for this pan is that it produces crust over the entire surface, on the bottom as well as the top. The bread is said to bake evenly, and the

The Crusty Bread Pan.

loaf being of a moderate size, it is more apt to be fresh until used up instead of dried out, as in the case of a larger loaf. The pan is also adapted for use in baking spiced meat loaves. The manufacturers point out that the bead on each edge keeps the loavea a suitable distance apart in the oven, preventing them from running together, and by inserting a poker point slightly flattened into it the pan is readily taken from the oven.

### An AdvertIsing Suggestion.

Above the office of the General Repairing & Construction Company, 398 Gates avenue, Brookiyn, N. Y., appeara the following alliterative and comprehensive announcement in letters of imposing size:

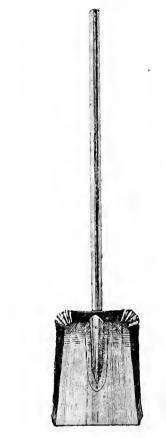

Elsewhere, on the front, is set forth the fact that the company are prepared to do sil kinds of carpentering and mason work, and to undertake the decorating, repairing and remodeling of buildings.

### Tool Holder No. 6.

Millers Falls Company, 93 Reade street, New York, are introducing a tool holder, as here shown. It is made of cocobois wood, with the metal or chuck Among the obvious advantages of the holder is the case with which a desired tool may be selected, the quick detection of the absence of a mislaid tool from its cell and the case with which tools may be changed in the chuck.

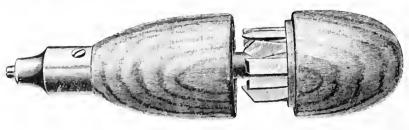

### Peninsular Furnace Shovel.

The accompanying cut represents a furnace shovel offered by the l'eninsular Metal Works, Detroit, Mich. The

Peninsular Furnace Shovel.

shovel is described as being made of the best quality steel, with double edge, and as having four thicknesses of material at the lower corners. The makers remark that the shovel is designed to supply the demand among furnace men

Tool Holder No. 6.

end nickel plated. The handle is arranged with a separate cell for each tool, of which there are 12, of the same quality, it is explained, as those put up with their Nos. 1, 4 and 5 handles.

for a long handled, light, stiff and shapely shovel for use around furnaces, and that this shovel is of proper shape both for handling coal and for taking up ashes, while it can be used for any

purpose for which any other, shovel is commonly used. The manufacturers claim that the price is from 25 to 50 per cent. less than for anything of a similar nature, and that in shape the shovel is different from anything on the market. The shovels are made in four sizes, from  $7\frac{1}{2} \times 15$  inches to  $10\frac{1}{2} \times 15$  inches.

### The Safety Stove Pipe Collar and Holder.

J. K. Randles, Quincy, Ill., for whom L. D. Sanborn, Grand Rapids, Mich., is sole agent for Michigan, is offering the stove pipe collar and holder here shown. The collar is designed to grip any kind of pipe, and ita adjustable claw hooks, which catch inside the flue at the outer ends, slso enter inside the pipe at its inner end, giving a long reach in the flue hole. The claw hooks being adjustable are readily adapted to the different thicknesses of walls,

The Safety Stove Pipe Collar and Holder..

and are held in place by thumb nuts. After the collar is firmly fastened in place the pipe is inserted through the collar and into the flue hole, when, with a screw driver, the screw in the collar is tightened, clamping it around the pipe. It is claimed that neither the pipe nor collar can possibly get loose or come out, until they are taken out, thus saving the carpets and wall paper from damage by soot and smoke, and obviating the necessity of wiring the pipe; and that no tools except a screw driver are required when putting it in place. The point is made that it does not mar or disfigure the wall and only upon close inspection can it be distinguished from an ordinary collar.

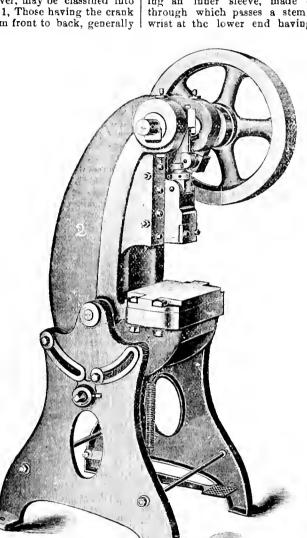

The Southwark Scale Company, Philade phia, Pa., are putting on the market a 60 gallon oil tank, which they state weighs 10 pounds more than the heaviest tank at present on the market.

Considerable uncertainty having been felt by importers in regard to the standing of goods now in bond under the new tariff law, Custom House authorities have given as their opinion that dutiable goods withdrawn after the new law becomes operative will pay the new rates, but goods made free by the new iaw will have to pay the duties existing at the time of their importation.

### No. 2 Adjustable Power Press.

The development and general introduction of the power press began with the invention of an efficient automatic clutch, a device which made it possible to engage a loosely running fly wheel by means of a treadle, with a crank shaft for one revolution only, and stopping the press automatically at the highest point of the stroke. A large variety of designs have since appeared, which, however, may be classified into two kinds: 1, Those having the crank shaft run from front to back, generally

producing a frame of pleasing outlines free from detrimental curves and kinks. The shaft is made of forged steel, journaled in removable liners, provided below with an adjustable shoe. This feature, which is referred to as entirely new on presses, supplies means for taking up the wear and for truing up the shaft by turning down in case of cutting or excessive wear. Only a new set of liners are required in the latter case. The connection consists of an exterior part of large diameter embracing and clamping an inner sleeve, made of steel, through which passes a stem with a wrist at the lower end baving a wide

No. 2 Adjustable Power Press.

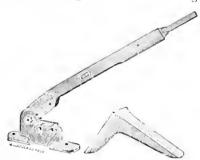

known as punches or punching presses;
2, those having the crank shaft running parallel with the front of the operator, known generally under the name of open back presses. Later on another feature was added to this class of presses by some builders—an arrangement to incline them. Since then these presses have frequently been termed "adjustable" or "inclinable" presses. This addition makes these presses preferable for die work, in which the work does not fall through the dies but is ejected from them. The press being inclined, it will slide down merely by force of gravity through the open back. The illustration herewith represents a line of presses of the latter kind, manufactured by Rudolphi & Krummel, Chicago, Ill. The frames or bodies of these presses are designed on the straight line principle, the points of pressure being connected by metal, arranged in atraight lines as much as possible, thereby gaining strength and

bearing in the slide. For adjusting, only small light wrenches are required. The slide is guided in acraped, adjustable V gibs of extra length. The clutch is the so-called Johnson clutch modified. It consists of a solid piece of round tool steel, flatteued and hardened on the end. The clutch can be taken apart instantly by sliding out the wheel on the shaft. Two or three locking points are provided in the wheel. A knock out, not shown in the cut, is provided on these presses for combination dies. It is carried in the slide and is adjustable from the front of the press. The adjusting of the press from upright to incline is done on smaller sizes by means of a geared segment and pinion; on larger ones the pinion is replaced by a worm. A few turns of a crank will accomplish it. The illustration shows the No. 2 press. The manufacturers wish to call attention also to the unusually large die space, both as to hight

and depth, which these presses have. Four sizes are being built at present, the smallest one being a bench press.

#### Some New Tools.

We show in the accompanying Illustrations some tools put on the market by R. M. Clough, Tolland, Conn. Fig.

Some New Tools.—Fig. 1,—Hand Lever Shear,

1 is a hand lover shear intended for a stock shear and rod cutter, to be used in carriage and light blacksmith shops. It will cut off 4-inch stock easily and 4-inch round iron. The shear can be fastened either to the bench or post by the use of the bracket, and takes but very little room.

Fig. 2 is a foot power shear with a capacity to shear up to  $\frac{1}{3}$ -inch stock, and has a 4 inch blade which will cut a width of 6 inches. The press works

Fig. 2.-Foot Power Shear.

by foot power, thus giving the operator the use of both hands in guiding the work. It is provided with two gauges, one for stripping and one for angular cuts. The table is marked with degrees as indicated in the illustration, and the tool, as shown, is fastened to the bench.

Fig. 3 is the No. 2 punch, having a capacity for punching ½-inch holes in ½-inch iron. It is adapted to be operated either by foot or hand lever and likewise can be made to run by power if desired. It is provided with two

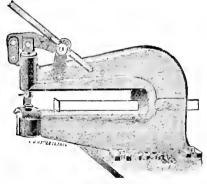

Fig. 3 .- No. 2 Punch.

gauges, one to gauge the hole from the edge and one to gauge the distance of the holes apart. The holes can be punched 18 inches from the edge, or at the center of a 36-inch sheet, and from 1 to 12 inches apart.

# TIN PLATES.

### The Welsh Tin Plate Situation.

Considerable friction still appears to exist between the Welsh Tin Plate Workers Union and the employers in regard to the observance of the 36 box The union officials continue to insist on the maintenance of the rule, and in several instances the workmen have adhered to their mandate and gone on strike aconer than increase their output beyond this limit. has been the case at the Glynbendy Tin Plate Works, near Brynamman, which have recently been closed down. According to the Iron and Steel Trades Journal the manager of these works declared that owing to the restriction of ouput they were lesing 9 cents on every box of finished plates, and as they could make black plates without loss they naturally preferred to take orders for that article than for the finished plate. The men took the slarm, and gave notice to cesse their employment unless more regular employment was found for the tinmen. The manager frankly told the men that if they would increase the output per day, and so lessen the cost of production, he would book more orders for tin platea. This, however, they were not willing to do, hence the works have been closed. Similar action on the part of the men employed at the Avon Vale Tin Plate Works, in the Abersavon district, has resulted in the closing of those works and the throwing out of employment of 300 men. At some works, on the other hand, the men have appreciated more clearly where their true interest under the existing conditions lies, and have made concessions to their employers. In the Phillips works, at Abertillery, Nantyglo and Pontymister, for example, they have conceded 15 sheets to a box, with the consequence that those works are all kept in active operation. So low are prices for tin plates on the other side, however, that manufacturers are taking steps to reduce the cost of production in every possible way, being apparently convinced that low prices have come to stay, and that they can never hope to revert to those of two years ago.

### SCRAP.

BRITISH EXPORTS of tin and terne plates to all countries for the month of July, 1894, were 25,910 tons, as compared with 33 601 tons in July 1893. Exports to the United States were 17,805 tons, as compared with 17,247 tons in the previous month and 22,248 tons in July, 1893. So far this year the shortage in shipments as compared with the first seven months of last year is about 63,000 tons.

DREIFUS, BLACK & Co., iron and steel brokers of Pittsburgh, Pa., have, says the Dispatch of that city, secured 10 acres of land at New Kensington, Pa., for a site for a black plate and tin plate mill. The equipment will, it is reported, consist of four hot and four cold rolls and a tinning set of ten stacks. About \$250,000 will be in-

vested and work will be commenced at ouce on the construction of the mill. Employment will be furnished to 300 men.

A SAMPLE of Pennsyl Old Method recoing plate sent out by Gummey, Spering & Co., Philadelphia, is one of the best advertising cards that can be issued. The sample is 5 inches square and earries the stamp with which these plates are marked. It is large enough to be thoroughly inspected and the heavy coating of the plate can be tested readily. The plate evidently has considerable tin in the coating and the mottles give the appearance characteristic of heavily coated plates.

A REPORT of the New York Custom House, recently issued, shows that 14,766,116 pounds of tin and terne plates were held in bond in the warehouses of this city on July 31 in anticipation of lower rates of duty by the new tariff act, a considerable increase over the figures for June 30, and largely over the normal volume. It is probable that no large withdrawala will be made until after October 1, when the new duty rate will, by the provisions of the bill, come into effect.

A DISPATCH from Pittaburgh, Pa., to the Philadelphia Public Ledger takes a very hopeful view of the future of the tin plate manufacturing industry under the new tariff law. The settlement of the tariff, it says, has given an impetus to the development of the black plate and tin plate industry. Plans that had been maturing for months are now being put in effect. There is considerable esgerness displayed to invest money in this direction. The fact that the protection accorded black plates has been reduced 30 per cent, and tin plates 46 per cent, does not appear to deter investors from embarking capital in additional plants. B. Goldsmith, a tin plate importer of New York and Portland, Ore., is here looking up sites. He proposes to put up a \$200,000 plaut, with a capacity of 20 tons a day, or 2400 boxes of finished plates per week. Norton Bros., the tin plate manufacturers of Chicago, are said to be interested in the negotiations for the purchase of Oliver's Fifteenth street plant. Jsmes Hemphill of McIntosh, Hemp. hill & Co. says his firm are figuring on a plant. He thinks it will be necessary to see what the future labor coat will be before they go ahead. Capt. W. P. Tyler, the tube manufacturer, told of a project to build a \$200,000 black and tip plate works in this section. The tin plate works in this section. The Garrison Foundry & Machine Company have also had good queries recently from people who are figuring on erecting plants or adding black plate mills to their present works.

An Air of Alertness and expectancy, which has been conspicuously absent for many months, is noticeable this week among the New York in plate and metal houses. This is accounted for by the fact of a gratifying addition to the size of their mail in the shape of inquiries from would be purchasers, which inquiries, it is fondly hoped, will in many cases develop into orders

after Monday next. By that time the fateful quea ion whether the new tariff bill is "to be or not to be" will be finally aettled. A few weeks ago the mail of one of the leading houses in the trade consisted one morning on which it was visited of three letters—two containing inquiries and the third a remittance. A dczen clerks and atenographers were busily engaged in wrestling with the day's mail of the same establishment when it was visited in the latter part of this week. And yet it was said that but little actual business was being done. They were answering inquiries. This is a fair illustration of the condition of the tin plate trade in general at the present moment—a preparation for business "next week."

Some of the tin plate dipping works have closed down this week in anticipation of the passage into law of the new tariff bill, which will virtually demolish their business. On the other hand, runnors are plentiful as blackberries of the projected construction of new black plate mills and tin plate plants. A party of New York business men who are known to be interested in the establishment of a large tin plate works in the Pennsylvania gas region left this week for a few days' trip in the direction of Pittsburgh—a holiday jaunt, which, it is surmised, will result in definite steps being taken for the immediate prosecution of work in the new undertaking.

THE PURCHASE a few days ago in the New York market by a large Western concern, who have recently added a tinning plant to their rolling mill, of between 40 and 50 tons of pig tin is an evidence that they, at least, regard with equanimity the impending tariff changes, and are satisfied that, whether the bill is passed or vetoed, they will be able to make American tin plates on a large scale.

The fleet Cunarder, "Campania," in her last week's westward trip established her right to the title of Queen of the Atlantic. She accomplished the voyage from Queenstown to Sandy Hook in 5 days, 9 hours and 27 minutes, beating the previous westward record—that of the "Lucania"—by over three hours, and landing her passengers, for the first time, on the Friday evening. The average apeed made was 21.49 knota per hour for the whole trip. The list of runs was as follows: August 12, 516 knots; August 13, 528 knots; August 14, 543 knots; August 15, 525 knots; August 16, 545 knots; August 17, 126 knots. The "Campania" now holds both the westward and eastward transatlantic records.

Enormous withdrawals of whisky from bond are taking place, distiliers being anxious to escape the additional tax provided by the new tariff bill. The Treasury officials estimate the amount of the spirit that will be withdrawn from bond under the present tax of 90 cents a gallon at 6,000,000 gallons. Internal revenue receipts exhibit a material increase accordingly.

### HEATING po PLUMBING.

### NEW WORK AND CONTRACTS.

J. L. & F. II. Congdon of East Greenwich, R 1., are the contractors to put steam heaters in the new house building for N. B. Lewis at West Kingston.

A NEW REATING PLANT is to be placed in the Rescue Home for Fallen Women, at Philadelphia.

THE SCHOOL COMMITTEE OF SCRAN-TON, PA., are asking bids for a heating plant for the high school building.

GEORGE B. WARD has been given the contract for plumbing the 21 houses to be built for Newton Cloud on Stroud and Franklin streets, Wilmington, Del. He has also the contract for plumbing the six new houses for W. L. Wilson, at Eighteenth and Washington streets.

THE MERCY HOSPITAL, at Hamilton, Ohio, is to have a new steam heating plant.

THE DAVIS COMPANY and M. SCHIL-LINGER are putting in a steam heating plant which will furnish warmth for the entire Auditorium Building, at Moline, Ill., this winter.

E. H. UNDERDILL of Boston, of the Underhill Heating & Ventilating Company, is attending to the improvements in the High School Building, at Williamstown, Mass.

THE HOWARD HOSPITAL and Home for Incurables have applied for a permit for a new \$20,000 building on their grounds, on the southeast corner of grounds, on the southeast collector Broad and Catharine streets, Philadelphia, Pa. The building will be built of brick, two stories high, and will be heated by steam.

J. W. ROBERTS, one of the enterpris-ing plumbers of Tampa, Fig., has secured contracts for the plumbing in 84 buildings in Ybor Clty, among them being the large Seidenberg and Trujillo factories.

JOHN E. BARR, who was awarded the contract for the plumbing of the large six tenement block on Margin atreet, Lawrence, Mass., belonging to C. A. Doube, will have the work soon completed.

THE CONTRACTS for fitting the High School Building, at Shamokin, Pa., with the hot water system of heating and also for the necessary plumbing were awarded to H. Floyd.

JOHN KEARNS has the contract for the plumbing in the residence of Wm. E. Smith, now being built at Bridgeport, Conn.

BENJAMIN F. SHAW, Wilmington, Del., has been awarded the contract for the plumbing at the power house of the Manayunk & Roxborough Inclined Plane Railway, at Shawmont, Pa., for \$4000.

OLDS & WHIPPLE will heat the new residence of Henry P. Hitchcoek, at Hartford, Conn.

J. J. HOGAN of 972 State atreet has the contract for the plumbing and heating of Robert Carr's new house, 113 Foster street, New Haven, Conn.

WALKER & CAREY, Waterbury, Conn., have the following contracts on hand: The plumbing of Frank Bronson's two-tenement house, on Hospital avenue; plumbing and hot water heating of Geo. Rowbottom's house, on North Willow street; plumbing and tinning of a three-tenement block Building, 43 to 54 Dearborn street.

O. H. Northrup, Easthampton, L. I., N. Y., has secured the contract for the Town Hall Building, at Greenfield, the plumbing, engine and fixtures in Mass., has been let to J. E. Hubbard.

John Lawton, Baldwin street; | plumbing and hot air heating of A. D. Warner's house, at Naugatuck; plumbing of Mrs. Breen's house, at Naugatuck; plumbing and hot water heating of W. D. Crampton's house, at Naugatuck.

THE MORRIS PLUMBING & SUPPLY Company have been incorporated at Houston, Texas.

THE S. II. BEARD COMPANY, New Britain, Conu., have closed contracts for the plumbing and steam heating of the Samlow Block and Hotel Columbia and the heating by hot water of the Allen Homestead at Pequabuck, and have also been awarded the contracts for plumbing the residences of Carison and Torell and II. Capen.

HINDLE & WILLIAMS of Newark, N. J., have ordered several Volunteer boilers of DuBois & Darrow, New York, to be used in some heating contracts they have secured.

AT A SPECIAL TOWN MEETING, at Houlton, Maine, last week, it was voted to raise \$1000 for new heating apparatus iu District No. 1 School Building.

THE PAUPER COMMITTEE of the city government, at Springfield, Mass., talked over the project of repairing the almshouse and puttling in a system of ventilation. They will not advertise for bids until the matter has been looked into more thoroughly.

THE REPAIRS on the High School Building at North Adams, Mass., are under way. It is to have new heating apparatus put in and scientific ventilation will be provided.

THE FIRM OF BRADLEY & BRIGHAM, Marlboro, Mass., have been awarded the contract for doing the plumbing work in the French Convent School Building; also the construction of the galvanized iron ventilating flues to be used in the system of ventilation there. Six thouand pounds of galvanized iron will be used in the flues.

THE BOARD OF EDUCATION OF SIOUX CITY let the contract for making changes in the plumbing of the High School Building to the Iowa Construction & Mig. Company for \$218.

THE SCHOOL BOARD OF NORWOOD, Onto, have awarded the plumbing contract for the three buildings to E. R. Parrv.

ALBERT A. CRYER & Co., 85 Centre street, New York City, placed two No. 320 seven-section Richmond hot water heaters in the apartment house of Patrick Sheriden, and two No. 320 ten-section Richmond steam heaters in the store of Thomas Kelly, on Fulton street, Brooklyn. They have the contracta for placing Richmond steam heaters in the hotel at White Plains, N. Y.; in the residence of John P. Smith, North Newark, N. J., and in the residence of John A. Richard, at Erastina, Staten Island.

THE NEW JERSEY STATE BUILDING has been removed from the Worla's Fair Grounds to 736 Bond avenue, Chicago, and is being fitted up as a residence by G. T. Kessler. The steam heating plant is being put in by Cook & Chick, 253-255 Kirzie street, Chicago.

M. J. CORBOY, 78 Dearborn street, Chicago, has the contract for plumbing, gas fitting and aswerage in the Athenseum Building, 48 to 54 Dearborn street.

the house which is to be remodeled and altered for Charles G. Thompson at Easthampton.

THE WALCOTT HURLBUT COMPANY, 175 177 Lake street, Chicago, have recaived orders for 17 sections of the Siphon Eduction closet range from By City, Mich., and S sections from Escanaba, Mich.

THE KELLY & JONES COMPANY, 48-52 North Clinton street, Chicago, are to install a steam heating plant in the Hambelton Apartment House, Belmont avenue and North Clark street.

CHRISTIAN & Co. of Boston have been awarded the contract to put in the heating apparatus for the Mayo Lockey Block at Fitchburg, Mass.

The John Davis Company, 69-79 Michigan atreet, Chicago, report the following contracts: Engine connections for the O'Neill elevator, South Chicago; repairs to Waubansia Club steam heating plant, 355 La Salle avenue; overhauling Cook County Normal School ateam heating plant; installing steam heating plant in the John High Estate Building. Franklin and Michigan streets.

THE STOVER HEATER COMPANY, 89 Lake street, Chicago, report the following sales of Cuba boilers: For the four buildings of Julius Blaine, Forty sixth street and Forrestville avenue; residence of Jas. Sokup; flat building of Mr. DeYeuog, Hoyne and Chicago avenuea: residence of L D. Thomas, and residence of Mr. Luelgert, 629 Diversey avenue.

THE FULLER & WARREN COMPANY. 134 Lake street, Chicago, have received orders for their New School furnace to be placed in school buildings at Detroit, Mich.; Valley City, N. Dak.; DeKalb, Ill., and Kirkville, Mo. Also four combination heaters for buildings of H. Rubens, Calumet avenue; one combination heater for residence of J. R. Hansell, 5444 Ellis avenue, and furnace for the church, corner of Superior and Franklin streets.

JOHN B. SMITH & COMPANY OF Lewiston, Maine, have been awarded the contract for the plumbing on the new Masonic Temple In Augusta, at \$605.

THE NEWARK HEATING & VENTI-LATING COMPANY, Newark, N. J., have placed their order with DuBois & Darrow for a Volunteer boiler to be used in a heating contract which they have secured at Washington, D. C.

THE BAKER & SMITH COMPANY, 193-197 East Van Buren street, Chicago, are to install a ateam heating plant on the Ohio River ateamer "Clyde." Steam for heating will be taken from the steamer's boilers.

J. R. Hodges, Mansfield, Mass., is having a Victor ateam heater put in his new house on Union street. James W. Gifford is the contractor for both the heating and the plumbing.

AT A MEETING of the trustees of the Bridgewater, Mass., Academy a committee consisting of H. M. Blackstone, Dr. Calvin Pratt and P. O. Clark advised the trustees concerning the putting in of a new heating, ventilating and sanitary system. The proposed system will cost in the neighborhood of \$3000. The contract was placed with the Smith & Anthony Company of Boston.

THE CONTRACT for making alterations and repairs in the plumbing of

## STOVE TRADE NOTES.

### The New England Stove Trade.

What change there is in the condition of the stove trade in this section is in the direction of improvement, but there is very little life to it. There has been a noticeable increase in the number of inquiries, but the business resulting therefrom has been small and scattering. A number of the leading spirits among the Boston trade are still away on vacation, and it does not appear that many concerns have found it necessary to "come to attention" to receive the advance guard of the fall Some out-of-town dealers have already made their appearance in this market, but none of them have very encouraging reports to make. They are, as a rule, about as enthusiastic as a dealer from the Cape district who bought a modest supply of goods with the remark, "I suppose the floor will have to be filled with something, so give me a small assortment of showy and inexpensive goods." Parlor stoves are more active than they were in July, and ranges, if anything, a little less so. There seems to be a disposition on the part of the retailer to insist upon lower prices, but there has been no considerable shading by the manufacturer as yet. Collections are fairly satisfactory and the general feeling somewhat better. Doubtless when every one is ready for business and the season is a few weeks further advanced the hopes of the more conservative sellers will be fully realized.

The season for refrigerators and gasoline stoves is about passed and oil heating stoves are beginning to be in good request. There is also some little activity in the repair trade. Furnaces are moving much more freely and some manufacturers already have a gratifying number of orders. This branch of the trade promises to be quite busy during the coming season.

### Meeting of Southwestern Stove Manufacturers.

In pursuance of a call issued by D.

M. Thomas, secretary of the National
Association of Stove Manufacturers, a
meeting of stovemen was held at the
Southern Hotel, St. Louis, Mo., on
Monday of this week. All the foundries in St. Louis were represented at the
conference, as well as many of those in
Evansville, Ind, and Memphia, Tenn.
The object of the meeting, over which
Secretary Thomas presided, was to
afford the opportunity for a general in-

terchange of opinion regarding freight matters and the consideration of questions in which the trade at large were not directly concerned but which were of important local interest.

While this gathering was the first of Its kind which has been held, we understand it is not to be the last, for it is to be followed in the near future by others of a similar nature. The meetings are intended more especially for the gathering together of stove makers in the South and Southwest. The reason why manufacturers from other sections will not be invited to attend is that matters of interest to members of the trade in Missourl, Southern Illinois, Indiana and Tennessee are not likely to commend themselves to the serious consideration of stove manufacturers in Michigan, Pennsylvania, the New England States or other sections remote from the South and Southwest. In other words the meetings are to be held for the discussion of questions of local interest and from them much good is expected to result. We understand the next meeting is to be beld in November of the present year at either Evanaville, Ind., or Memphis,

### Enterprise Stove Company

of Vincennes, Ind., have brought out their annual catalogue in the shape of a publication of 80 pages, profusely illustrated and bound in colored paper covers, one of which carries the form of guarantee accompanying each stove or range sold. The goods illustrated are made under the generic name Star, with such prefixes as Home, Rising, Guiding, North, Bright, Silver, Rival, Tropic and Boss. Nearly 40 pages are devoted to cook stoves and ranges, while the remainder of the catalogue is given up to heaters of various kinds. The leader is known as the Star Diamond, a square parlor base burner of artistic design and substantial construc-The arrangement of parts is such that the cold air is carried from the floor and the volume of hot air for the room above is increased by inlets of air around and under the nickeled upper section. The effect of this is said to increase the power of the stove as a double heater, as well as to make it a most effective circulating or ventilating heater. The fire pot is made unusually deep and heavy, the ash pit is large and deep and the grate is the "Ransom improvement of the duplex." The stove is made in three sizes, with diameters of fire pots 12, 14 and 16 inches, re-In connection with the apectively. Star Oak, made in three sizes, there are presented cross and vertical sectional views clearly showing the constructive features. Cannon, box, laundry and cylinder stoves are also considered, as well as hollow ware, tln trimmings,

### The Thatcher Furnace Company.

The foundation of the Thatcher Furnace Company, 240 Water atreet, New York, was laid in 1850 by J. M. Thatcher, the inventor of the Thatcher furnace, and the company were incorporated in 1889. Charles O. Lyon was elected president and was eminently qualified for the position, having had a long experience as a salesman in making terms, hearing auggestions and criticiam and in locating and removing the trouble in badly arranged heating plants. Edward Benedict is the treasurer and has the management of the foundry and the pattern making department. L. M. Thatcher is the secretary, and a life spent in the business brings little to his care that is not satisfactorily disposed of. On the incorporation of the company they moved their manufacturing plant to Newark, N. J., where it was laid out with the idea of making additions as the business demanded, until their shops are now a model of convenience; railroad siding, sand cellars, coal and coke bins, pig iron yard, foundry, mounting shop, warehouse and office, all arranged for labor saving.

The Thatcher tubular furnace, which has been the leader of the house, apreading its name throughout the country, is possessed of several pecul-iar features. The fire pot is a remarkable example of extended surface. By a peculiar arrangement of tubes a large heating surface is presented without affecting the surface usually presented. The furnaces are made heavy and substantial in all parts and a great durability is claimed for them. The Scorcher ity is claimed for them. is a less expensive furnace of excellent reputation. In response to a demand for a range by their trade the Thatcher single and double oven range have been produced in excellent style and are be-coming rapidly popular. The latest coming rapidly popular. The latest addition to the goods of this enterprising company is a line of steam and-hot water heaters under the name of Champion which is meeting with marked favor among the trade. In May the company moved to a new salesroom at 240 Water street, which has only recently been completely arranged with samples. Secretary Thatcher will be found just inside the door with a welcome and a fund of information on all subjects. President Lyon has an office in the rear where none are ever turned away without encouragement.

### Danville Stove & Mfg. Company,

with works and main offices at Danville, Pa., and branches at New York and Chicago, have issued a well arranged catalogue and price list of Beaver stoves, ranges and heaters. It is a work of over 140 pages, carefully printed and profusely illustrated. The binding is in a delicate shade of light blue, carrying an embassed side title in letters of old gold. Following an announcement of terms and special notices, classification of castings for repairs and an alphabetically arranged index, there

are 70 pages devoted to ranges made under the name Beaver with various prefixes. These goods are carefully made, neatly ornamented and have met with a gratifying sale. New patterns are being added as the requirements of the trade seem to demand, so that the assortment is always up to date. The cook stoves occupy about 30 pages, after which are presented the heaters, the place of honor being given to the Beaver square parlor, for hard coal. This in turn is followed by the Princess Beaver, made revertible flue and indirect draft; the Ideal Beaver, for hard or soft cosl, and made in four sizes; the Beaver Oak, for coal or wood, shown plain and with ventilating flue, the Beaver Franklin, adapted for using coal or natural gas, and the Montour globe. The closing pages give attention to hollow ware, mica, stove bolts and repairs.

#### Belleville Stove Works.

The Belleville Pump & Skein Works, proprietors of the above named concern, at Belleville, Ill., have distributed to their friends in the trade a very attractive 120-page catalogue of St. Clair stoves and ranges. The size of the publication is such as to make it convenient for reference, while a back title enables the dealer to quickly find it when arranged on the shelf or table with other trade literature. The edges with other trade literature. are finished in bright red, the corners are rounded and the covers are of rich design. Among the opening pages we find directions for setting up and operating stoves, terms, prices of repairs and remarks relative to breakages and freight overcharges. The Acme wrought eteel range has the place of honor, followed by the St. Clair ranges which occupy 25 pages of the book. The cook stoves take up about 40 pages, the constructions being offered under such names as the St. Clair, Eclipse, Famous, Superb St. Clair, Belleville, Our Chief, New Aurora, Challenge, Matchless and Lily. The heaters fill the remaining pages of the catalogue, the leading place being given to the Prominent St. Clair, an air tight heater of unusually attractive design. The stove embodies the latest improvements and the company state it is "especially constructed to make the double heater feature a pronounced success." Other goods include the Laurel, St. Clair Oak, Cornelia, Merit Oak, Vulcan, Star, Merit Laurdry, Graphic St. Clair, Parlor Queen, Imperial and Pet. Hollow ware, elbows, stove pipe, &c., are also considered.

### ODD PLATES.

"OUR OIL HEATERS ARE THE BEST" is the proclamation of a four-page circular printed in green and red ink sent out by F. M. Borden & Brother, Philadelphia. Four points extending from a circle give their cardinal points, the ink being cardinal. A salutatory gives some interesting points on oil stoves, and cuts of the Sunbeam and All Right oil heaters in brown ink and of the Ideal, Electric and New Process in green ink show a line that has no "shopkeepers."

THE REPRESENTATIVES of the Thatcher Furnace Company, New York, are presenting a handsome new business card to their trade bearing a lithograph design in which Thatcher furnaces and ranges and Champion steam and hot water heaters occupy a prominent position. On the reverse side

is a view of their works at Newark, N. J.

E. E. Horton, one of the representatives of the Thatcher Furnace Company, 240 Water street, New York, has just returned from a two months' trip through Ohio, Pennsylvania and New York. The natural result is shipments all over these States of Champion steam and water heaters and Thatcher tubular hot air furnaces.

GEO. B. SCOVILL, Waterbury, Conn., according to the New Haven Weekly Record, has taken a contract to make the castings for the stoves and furnaces of the Richardson & Morgan Company of New York for one year, and is enlarging his foundry for that purpose. This will necessitate the employment of about 30 additional hands.

THE DANGLER STOVE & MEG. COM-PANY of Cleveland, Ohio, show illustrations of the Dangler gas radiators and heating stoves in a 20-page pamphlet which is being distributed to the trade. Iu offering the goods to dealers the company state that the demand for the patent radiators last season and the satisfaction they gave to users "fully demonstrate that an ordinary room can be heated with gas at moderate expense, and the dirt, annoyance and labor of heating with coal and wood can be avoided." The makers have added to their assortment a new return tube radiator which is sold at a low price. Another novelty in the way of a gas heating stove is described as the Dangler Columbia, made with either nickel or black base, center and top, and with round corrugated polished copper reflector, open from all sides, making it an attractive piece of furni-ture. In connection with the burner it is stated that a current of hot air is forced into the flame at its point of ignition and this with the air at the outside of the flame keeps in circulation a large volume of hot air "at a minimum of gas consumption."

THE KERNAN FURNACE COMPANY of Utica, N. Y., and Chicago branch at 71 West Washington street, issued under date of August 1 a wholesale price list of Kernan warm air furnaces and combination heaters. These goods are illustrated, and in connection with each engraving is a table showing the various sizes in which the heater is made, dimensions of some of the more important parts, heating capacity in cubic feet and list prices. Attention is also given to agricultural furnaces and kettles for coal and wood.

It is reported that the Thomas Stove Company have built a foundry at Ball Flat, Ala.

THE JOHN VAN RANGE COMPANY have just closed a contract for the complete equipping of the new Hotel Attas now in course of erection and completion at Dayton, Ohio. It is stated that the new house with its appurtenances will be one of the very best in the State and will be under the able management of A. B. Ridgeway, for many years in charge of the Phillip House of the same city.

THE DANVILLE STOVE & MFG. Company of Danville, Pa., favor us with a folder, printed in colored ink and calling attention to the Beaver range, which is claimed to be able to burn any kind of fuel, is fitted with duplex or triplex grate, as desired, and is adapted to use the company's patented system for heating upper rooms from the oven. The inside pages are embellished with views of two varieties of the Beaver range, accom-

panied by poems composed by James Whiteomb Riley. One is entitled "Like His Mother Used to Make" and the other, "Our Hired Girl," both, of course, referring to methods of cooking.

The Lehigh Stove & Meg. Company of Lehighton, Pa., are offering the trade the Gem Lehigh, a neat 5 hole range made in three sizes. The smallest has an oven measuring 13 x 13 x 9½ inches and the largest 17 x 17 x 11 inches. The stove has anti-clinker grate, top and shelf broiling door, illuminated wood door and nickel trimmings.

The Star Coupler Company, St. Louis, Mo., advise us that George M. Clark & Co., Chicago, manufacturers of the Jewel gasoline and gas stoves are now using the Star couplers exclusively in connecting water backs. The Star Coupler Company are in receipt of inquiries from Canada and also from several points in England. Their trade is increasing, and with their increased facilities they will be able to handle all the trade intrusted to them.

E. Bement & Sons of Lansing are sending out a little pamphlet containing testimonial letters from some of those who have handled the Palace Regal square parlor stove. These letters are of a highly commendatory character and indicate, in a measure at least, the degree of satisfaction which the stove has given both to dealers and users. The company ascribe the great success of the stove to the fact that it is so constructed that the hot air and amoke are exposed for a long time to a great extent of radiating surface.

"An honest tale speeds best when plainly told" is the title of a little folder descriptive of the Quincy radiator, an air tight wood heater made by A. Ohnemus & Brother, Quincy, Ill. The heater is made in two sizes, the larger being 26 inches long, 18 inches wide and 24 inches high, while the smaller is 21 inches long, 15½ inches wide and 24 inches high. The device is constructed with Russia iron and cold rolled steel bodies and No. 20 steel linings. It has cast iron front draft door with spark guard on the inside

HENRY GLEASON, agent, of 106 Beekman street, New York City, has issued a circular to the trade, calling attention to the improved conditions existing by reason of the settlement of strikes and the tariff question, and suggesting that every wheel turned in the stove foundries starts one in some other establishment. He asks that the wheels in his business be started by sending orders for urns, bronze figures, stove knobs, hinge pins, stove tiles, gas cocks, air mixers and other specialties for which he is agent.

THE TRIUMPH warm air furnaces and combination heaters are the subjects of consideration in a very neat pamphlet just issued by the Craig-Reynolds Foundry Company, with main office and works at Dayton, Ohio, and Western branch at 82 Lake street, Chicago, Ill. The pages are 7½ x 10 inches in size, permitting the use of large cuts which clearly show the constructive features of the goods illustrated. There is a chapter on "Principles of Heating," with remarks touching the selection and construction of a heating apparatus, followed by brief reference to the various styles of apparatus comprised in the Triumph lines. The engravings in many cases represent broken views clearly indicating the internal arrangement of parts. Tables,

which are contained within the covers of the pamphlet, give the weights, measurements and capacities of the various sizes in which the goods are made.

KERNAN FURNACE COMPANY of Utica, N. Y., have issued through their Western department, 71 West Washington street, Chicago, a descriptive and reference catalogue of Kernan warm air furnaces for soft coal. These furnaces εre of new design and are so constructed that the air for draft is heated. principles underlying the system are explained in the introductory pages, in which the company state that they are the pioneers in using a heated draft. The furnace is termed by them the Kernan smoke consumer, as perfect combustion is secured, with the avoidance of the formation of soot. Illustrations are given showing the internal construction of the furnace, the arrangement of draft flues, the hexagonal grate used, &c. After several pages of testimonials, a perspective view and ground plans are given of a school house heated and ventilated on the Kernan system. The Western office is also distributing a very nest miniature catalogue and price list of Kernan warm air furnaces and combination heaters for hard as well as for soft coal.

JESSE REYNOLDS, senior partner of the firm of J. Reynolds & Son, Thirteenth and Filbert streets, Philadelphia, dted August 17, after a lingering illness, at his residence, 1221 Green street. Mr. Reynolds, who was born 80 years ago at Rising Sun, Md., was a pioneer in the furnace and range trade in Philadelphia and built up an extensive business, in which he amassed a snug fortune. He was active in Mssonic circles and a trustee of Green Street M. E. Church. One son, William T. Reynolds, survives him.

The John Van Range Company, Cincinnati, Ohio, who were recently awarded the contract for the complete culinary equipment of the new lake steamer "Northwest," plying between Buffalo and Duluth, by her owners, the Northern Steamship Company, have just received an order to duplicate the outfit for the latest addition to their magnificent fleet, the "Northland," the latter being a counterpart of the "Northwest." These vessels comprise two of the largest, swiftest and handsomest steamers engaged in the lake passenger traffic service, measuring 386 feet over all, 44 feet breadth of beam and supplied with 7000 horse-power engines having an actual speed capacity of over 21 knots. The outfits furnished are in thorough keeping with the rest of the appointments on these magnificent steamers.

WE ARE INDEBTED to the Raymond & Campbell Mfg. Company of Middle-town, Pa., for advance sheets showing some of their new goods for this sesson. The first to which our attention is invited is the Art Perfect, a full revertible flue base burner of graceful outline and appropriate ornamentation. It is so constructed that the cylinder can be removed by simply taking out two bolts, while the entire upper nickel section can readily be removed as one piece. The stove has large ash pan, Ransom duplex grate and two large hot air flues in the rear of the stove for taking the heated air to the floor above, thus making it a powerful double heater. The Perfect is a new square stove, direct draft, embodying the latest improvements and decorated in an attractive style. The Perfect Gem

is a medium priced single and double heater made in three sizes. The company have also added to their assortment the Electric oil stove, having taken the exclusive agency for the heaters, ranges and cook stoves made by the Electric Oil Stove Company.

THE WILLIAM G. FISCHER MFG. COMPANY of Kokomo, Ind., are distributing a folder to the trade directing attention to the Fischer steel ranges and other culinary implements which they manufacture, in over 170 varieties. The company refer to their extensive works, location and shipping facilities as enabling them to promptly fill orders "and make terms and prices to suit the times."

ONE-HALF the ownership in the Susquehanna Iron Works, Middletown, Pa., owned by the Raymond & Campbell Mfg. Company, has been transferred by Joseph Campbell to the sons of the late Seymour Raymond. With the idea of further extending the business, which has always been a prosperous one, it has been decided to issue \$150,000 coupon bonds based on a first mortgage security.

SCANLAN & Co. of Louisville, Ky., have just issued from the press an exceedingly neat and attractive pamphlet of over 60 pages, devoted to new patterns of grates, frames, baskets, linings, &c., for the season of 1894. The printing is in two colors, each page carrying in the center at the top an ornamental piece, which we take to be a fac-simile of their trade-mark. The designs presented are numerous and artistic, the engravings in many instances being made directly from photographs of the finished articles. In connection with the illustrations are given size of openings, style of finish and prices, together with the statement that all goods are guaranteed. The assortment is extensive and the company enjoy facilities which enable them to make prompt shipments. We also have before us a copy of a little work entitled "Suggestions to Buyers of Grates or Fire Places, and 'Pointers' on the Advantages of Scanlan's Patent Challenge Victor, Climax and Triumph It is a pamphlet of over 40 pages and gives well executed engravings of the goods named. Accompanying this publication is a trade price-list of patent grates, f.o.b cars at Louisville, subject to a certain discount.

THE DETROIT STOVE WORKS of De troit, Mich., state that the Detroit Jewel parlor heater is the only one of many new constructions shown in their 1894 catalogue, a copy of which will be mailed to the address of any dealer who may apply for one. The company will also send their 1894 discount sheet to any one who will take the trouble to write for it.

ONE OF THE LATEST advertising novelties issued by the Detroit Stove Works of Detroit, Mich., is referred to as a "boon to housekeepers," and is entitled "The Household Reminder." It consists of a piece of heavy cardboard, measuring about 6 x 9 inches, with the greater portion of one side occupied by three columns of names of articles for household use. The printing is in bold faced type so as to be readily seen at a short distance. Opposite each name is a hole into which fits a little wooden peg, there being a number furnished for the purpose. The idea of the scheme is this: When the stock on hand of any article in the kitchen runs low a peg is placed in the hole opposite the name of the article so that when ready to send to the

store for supplies a glance at the pegged board shows what is needed. The card is arranged to hang up in a convenient place, and carries on its back a table of a few weights and measures useful in the kitchen. As might naturally be supposed, reference is made here and there to the Jewel stoves and ranges.

THE ROCK ISLAND STOVE COMPANY of Rock Island, Ill., are pushing their specialties and calling particular attention to the Home Riverside range and Riverside Oak. The former is a new construction with rich ornsmentation and embodying the latest improvements. It is referred to by the makers as the "perfection in art and finish."

THE PERRY STOVE COMPANY, 242 Water street, New York, are showing several new things that will attract the stove dealer when he comes to town. Under their trade-mark name Argand the company are showing a line of five different styles of oil heaters, ranging from the Baby Argand bathroom heater to those having a capacity for heating large rooms. They are made with planished iron bodies, ornamental top, and handsomely nickel plated bases of different designs, in which the oil tanks are set. All have quick lighting devices and are provided with indicators to denote the amount of oil in the tank. Two new sizes have been added to both the New Hero and New Gipsy lines of ranges. The New Grand, that is designed to sell at a low price, is a very handsome square heater, full nickel trimmed and provided with all convenlences. The Cadet is a new cylinder stove made in nine sizes from 8 to 16inch diameter, with a shaking slide center grate, clinker door and a swell ash door that gives it a very attractive appearance, but the taking feature is the method of connecting the body. The planished body fits down inside of the casting and is secured by bolts, making an invisible joint and one which overcomes the trouble of fine ashes and dust escaping at that point.

THE FALL CATALOGUE of gas stoves made by Luther & Lederhos, No. 30 Cliff street, New York, is just being sent to the trade. It has a light brown cover, which carries the address of the firm and a picture of their new base heating radiator. Within the pamphlet the first stove shown is the Brilliant Star, a round heater with an open reflector and a door for lighting the burner, which is of the illuminating style, the light shining brilliantly through a star in the front. The stove is also made with an upper section for heating large rooms. Next comes a new line of gas radiators, known as the Enterprise and of handsome design. This is so made that the hot gases pass back and forth through horizontal tubes till the exit at the top is reached, and which is so arranged that a chimney connection can be made. It is followed by two styles of vertical tube radiators, one of which is very prettily ornamented with nickel and jewels, the other being less pretentious and less costly. Then appear the Home Comfort, Pilot and Enterprise reflectors, the Enterprise asbestos heater, Enterprise gas log, and the Eclipse, Charm and Little Wonder gas heaters. The next pages are devoted to the Enterprise, Hercules and Ruby oil heaters, followed by small oil stoves for cooking and for use with a heating drum. The Enterprise lamp heating drum. The Enterprise lamp-stove is made with one and two burners and with cast iron and tin tanks. Next is a gas stove for nurseries and a gassoldering and plumbers' furnace, the Acme gas asdiron and a line of gas atove supplies. The last page shows the Enterprise gas range for cooking, which is sessonable throughout the year. The catalogue will be sent to all who apply for it.

THE DETROIT STOVE WORKS, under the supervision of their superintendent, Lafayette Crowley, have just completed for the committee on standard tests of the American Society of Mechanical Engineers the esstings of 12 series of tests bars; each series comprises in duplicate every size of test bar that has ever been used, ranging from 1 to 4 inches square, and for transverse, tensile or compression test. A separate hest was made for each series in a cupola especially arranged for this work, and the silicon was made to vary from 1 to 31 per cent. Six of the series were made from Iroquoia (coke) pig, and six from Henkle (charcoal) pig iron. the member of the committee who has this matter in charge is W. J. Keep.we shall expect some valuable conclusions regarding the relative strength, shriukage and chill due to change in composition and size of the casting.

THE KEARNS & RUDOLPH RANGE COMPANY were dissolved on the 14th inst. Charles Rudolph has purchased the interest of John J. Kearna in the company and will continue the business under the company name. There is a good demand for the wrought steel ranges and culinary apparatus manufactured by the company, and under its new proprietorship such demand will no doubt increase.

J. W. PANSON of the firm of J. W. Paxson & Co., Philadelphia, sails for Europe in the steamship "City of Paris" on Wednesday next. He purposes making an extended tour among the principal business centera.

THE CHICAGO & ERIE STOVE COM-PANY's works at Erie. Pa., came near to being seriously damaged by fire last Wednesday night. The fire started on the roof of the molding department, hut was extinguished before it had done any harm worth mentioning.

### Trade Notes.

E. BEMENT & Sons, Lansing, Mich., issue a new catalogue relating to Bobsleds of their manufacture. They make an extensive variety of these gooda adapted for farming, logging, mining, as well as Sleds for roads and mountains. The illustrations show many different styles of Sleds, and price-lists are given.

THE PROMINENT page announcement in the issue of the Windsor Heater Company, Gslens, Ill., will be of interest to the heating trade throughout the country. A large cut shows the construction of the boiler, which, according to the wording of the advertisement, is adapted for hard and soft coal.

THE BLACK DIAMOND extra coated Roofing Plates are the subject of the adrooning Plates are the subject of the advertisement of the Black Diamond Tin Plate Works, 51 and 53 Laurel street, Philadelphis, that appears elsewhere in this isaue. The plates are described as thoroughly American, and the trade are invited to send for sample sheets for testing.

ATTENTION is called to the advertisement of the Marion Stove Company of Marion, Ind., which appears elsewhere in this issue. A cut is given which shows the company's Retort Stove in its care of them.

new dress. The increased attractiveness of the Stove is expected to add considerably to its aelling qualities. The Stove is adapted to the use of any kind of soft coal, no matter how "sticky." The increased trade enjoyed by the company from year to year is the best evidence that the Stove meets the expectations of consumers.

WE HAVE RECEIVED a catalogue of 48 pages from the Manneer Drill Mfg. Company, Rochester, N. Y. The first pages show Bench and Post Drill's for shops, followed by a variety of Twist Drills, Drill Sockets and Drill Chucks. A page is devoted to Pipe Wrenches, Pipe Cutters and Combination Wrenches, after which are shown Portable Forges, Blowers. Combined Punch, Shear and Bar Cutters, and then come Taps and Dies for cutting threads for all purposes.

THE ETTE & HENGER MEG COMPANY, St. Louis, are issuing a pamphlet to b: inserted in their catalogue No. 3. pamphlet consists of eight pages, and contains descriptions and prices of Grindstone Fixtures. Shoe Lasts, Lap Las's, Flower Pot Brackets, Japanese Lawn Sprinklers, Hose Pipes and Blind Hinges. Particular attention is directed to their line of Shoe and Lap Lasts, which are made in a number of sizes and at low prices.

A PRETTY CARD is being sent out by the Bellaire Stamping Company, Harvey. Ill., calling attention to the Columbian Enameled Ware. The scene depicted on the card is a kitchen interior, and the faces of the mistress and maid are exquisitely executed. Awful caricatures too often decorate such ad. vertisements, and it is a relief to find such artistic work as in the present

THE TRADE will be interested in the four page announcement elsewhere of the Phillips & Clark Stove Company, Geneva, N. Y. The first page shows the 1894 and 1893 patterns of the Art Andes Parlor Stoves, then the Crown Andes, Pearl Andes, Grove Andes and Magle Andes are illustrated, followed by the Grand Andes six hole Range, the Glen Andes six hole Range and the Lake Andes and Active Andes four-hole Ranges. The Phillips & Clark Stove Company have an Eastern branch at Troy, N. Y., and a Western agency with H. Rendtorff & Co., Chicago, Ill.

PIERCE, BUTLER & PIERCE MFG. COMPANY, Syracuse, N. Y., are sending out to the trade cards relating to the Parlor City Flue Cleaner. An illustration of this device is shown on the card and a general description is likewise given. A price-list is printed on the back of the card.

Which Is Cheaper, Gas or Coal?

The following letter by R. E. Edmonds of the Pennsylvania Gas Furnace Company, Buffalo, N. Y., is taken from a Buffalo daily paper: "I have from a Buffalo daily paper: "I have seen a number of articles in your paper which state that gas is more expenaive than coal for heating. I claim that gas is from 25 to 50 per cent. cheaper than coal. There has never been honest competition between the two fuels. It will not do to tell us of the ninetcenth century that we are going back to coal, with its dust, dirt and ashes and expense of keeping stoves and furnacea in repair, to say nothing of the labor required to take

"With gas in stoves and furnsces? we have no dust, no dirt, no labor and not half of the expense for repairs; moreover, gas stoves and furnaces will last twice as long as coal stoves and furnaces. There is enough gas wasted every day in this part of Pennsylvania to supply Buffalo with heat and light. If 25 per cent, of the money spent in opening coal mines were expended in developing gas we would have gas enough and to spare.

"Would you expect to use electricity to run a steamboat whose boilers and engines were built for steam; or would you expect to burn coal to an advantage in a stove made for wood? principle is almost identical in both If these who wish to burn gas wish to compete with coal, let them buy gas stoves and furnaces. Stand in a gas office for 15 minutes and listen to the people who come to pay their gas bills and you will hear more complaining in those 15 minutes than you will hear in any store in a month. It is not the fault of the gas company that your bill is large, but it is your own fault. Get the practical gas stoves and gas furnaces and then watch the result.

"New gas fields are being found almost continually all over the United States and Canada. To prove this, see the following copy from the eleventh census report of the United States:

" 'Natural gas found in the following States-Alabama, California, Colorado, Illinois, Indisna, Iowa, Karsıs, Kentucky, Louisiana, Missouri, New York, Ohio, Pennsylvania, South Dakota, Tennessee, Utah, West Virginia, Wis-consin, Wyoming and to some extent in Texas, Michigan, Arkansas and Wash-

ington. "The most important fields are those of Western Pennsylvania. Western New York, Northwestern Ohlo and Esstern Central Indiana.

"The time is not far distant when we will have gas all over the world. The Standard Oil Company have wakened up to the fact that gas is the coming fuel, and are putting labor and money Into it. They will soon control the gas as they do now the oll.

"It is true that a gas well occasionally gives out, becomes exhausted. Would you expect it to last forever any more than a coal mine? Drill new wells the same as you dig new coal mines; then the supply will be kept above the de-

"To show that gas is cheaper than coal, here is a letter from a man who has tried both in fair competition:

R E EDMONDS.

R. E. EDMONDS.

DEAR SIR:—Yours of February 8th at hand, and in reply will say that my coal and gas bill for the year before 1 used a gas furnace was \$102.50, to say nothing about a boy I paid \$5 per month for taking care of coal furnace. From October, '92, to October, '93, my gas bill for gas furnace, grates, cooking range and lights was \$52.30.

Yours truly,

Jamestown, N. Y.

"In every case where gas and coal have had fair competition, in circumstances described above, gas has proved the chesper."

THE AVERY STAMPING COMPANY, Cleveland, Ohio., issue a circular re-relating to Scamless Steel Hollow Ware and General Metal Work. Ware and General Metal Work. The Hardware and House Furnishing Department makes a line of goods, including the Avery Silver Steel Hollow Ware, Pure Niekel Saucepans, Steel Washers, Steel Garden Trowels, Steel Pipe Hook Plates, Pressed Steel Fence Posts and Hitching Posts, Ladles and Steel Mill Tote Boxes.

# TRADE REPORT.

### The Iron Market.

Thus far the expected general improvement in the Iron trade has materialized only to a very modest extent. In some lines and in some localities there has been a somewhat larger demand, but its volume is far from being such as to make the slightest impression upon prices. Since conditions have been abnormal, so far as supply is concerned in the trade of the Central West, a return to ordinary state of affairs means an approach to prices prevailing before the Coal and Coke strikes.

An increasing number of furnaces are getting to work, and the indications are multiplying that the supply of Bessemer Pig is exceeding the demand

Bessemer Pig is exceeding the demand.
While Pittsburgh and Wheeling are
firm for Steel Billets, other districts are
taking what business there is coming
up further West and in Cleveland.
Chieago has taken quite some orders,
and is aggressive and accommodating.
Buyers of Soft Steel have played a
waiting game for so long a time, with
the odds against them, that many will
only come in for future requirements
when tempting concessions are made.

Cincinnati, as the principal distributing point for Southern Iron, reports some good inquiries but at prices far below seilers' viewa. Ever so slight a feeler has some elements of encouragement.

Pig Iron.—The New York market fails to displaylany signs whatever of any improvement in volume of business. There is little inquiry, and that only for small lots. We note a sale of 500 tons of Bessemer Pig to an open-hearth plant in this vicinity, the balance of the requirements of the year having been taken by a Lehigh Valley company. We quote standard brands \$12.50 @ \$13 for No. 1: \$11 @ \$12 for No. 2, at tidewater. Southern Iron, same delivery, \$11.50 @ \$12.25 for No. 1; \$10.50 @ \$11 for No. 2; \$10 @ \$10.25 for No. 3; \$10.25 @ \$10.75 for No. 2 Soft, and \$10.50 @ \$11 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9.75 @ \$10.25.

In the Philadelphia market sellers say there is a much better demand for Pig Iron, but as yet it is difficult to get better prices. Those who ask an advance lose the business, but in some cases order books are in such condition that makers prefer to do that rather than accept medium or inside current rates. It is very encouraging to note that sellers are beginning to assert themselves, but the contest is not decided yet, although a couple of weeks more may settle the matter. General quotations for Philadelphia or equivalent delivery are as follows:

Standard No. 1 Foundry X Standard No. 2 Foundry X	11 50 GA	10 00
AVU. A PIRID	10.75 @	11 OO
No. 1 Soft No. 2 Soft	11,50 @.	11.75

Trade has been fair in the Chicago Pig Iron market the past week, but heavy buying seems to be over for the present. Carload lots are in good demand from the smaller foundries, which are gradually getting more work. Shipments are increasing rap-

idly and shipping instructions are now running shead of terms specified in contracts. Merchants say if this continues at its present rate contracts will have to be increased and prices will be considerably strengthened. These remarks apply solely to local Coke Iron. Southern Iron is neglected, sales being confined to occasional carload orders. Lake Superior Charcoal is also quiet, but as car orders are now coming up it is expected that Wheel Foundry will soon be running on a larger scale, which will lead to a heavier consumption of Charcoal Iron. Quotations are given as follows for cash:

Lake Superior Charcoal	\$14.25 @	\$15,00
Local Coke Foundry, No. 1	10.25 @	10.50
Local Coke Foundry, No. 2	10.00 @	10.25
Local Coke Foundry, No. 3	9,50 @	10.00
Local Scotch	10.25 @	
Ohio Strong Softenon Mr.		10,50
Ohio Strong Softeners No. 1	13.00 @	13.50
Southern Silvery, No. 1	@	
Southern Silvery, No. 2	Õ	
Southern Coke, No. 2	10.75 @	11.25
Southern Coke, No. 3	10,50 @	10.75
Southern, No. 1. Soft		
Routhown No. 9 Cost	10.75 @	11.25
Southern. No. 2, Soft	10.50 @	10.75
Tennessee Charcoal, No. 1	@	
Tennessee Charcoal, No. 2	@	
Alabama Car Wheel	17.50 @	18.00
Jackson County Silvery	15.25 @	16.00
Other Obio Silvery		
Other Onto Shivery	14.25 Ø	14.50
4.1 * * *** * * * * * * * * * * * * * * *		

Advices from Cincinnati intimate that there has been an increased produc tion of Pig Iron in most districts and there has been no such advance in the value of the finished product as to jus-tify the mills in paying an advance for Pig Iron. Foundry grades are well sustained but quiet, there being only moderate sales of No. 2 Foundry at \$7.50, f.o.b. Birmingham. There were numerous inquiries for round lots, aggregating upward of 10,000 tons for forward delivery, but buyers' views are so far below those of sellers that there was little actual trading. There is not much demand for Charcoal Iron and there is little more than single car lots selling. There is a fair quantity of iron being melted by the Iron Pipe Works, but the jobbing foundries are doing only a moderate business in this district. The tone of the market in general is easy. Quotations are as follows:

J	
Southern Coke. No. 1	<b>\$10.75</b>
Southern Coke, No. 2 9.75 @	10.00
Southern Coke, No. 3 9.25 @	9.50

### Metal Market.

Pig Tin.—The record of speculative dealings during the week involves about 400 tons, and probably one-half as much sgain has been done in small lots oueside the speculative clique. Prices early in the week were run up about 0.30¢ for spot dellvery, but a reaction to former figures has taken place since then. In fact the market is laboring under the influence of tariff uncertainty and speculative manipulation that leaves ordinary calculations very much at a discount. Jobbers are therefore proceeding cautiously and consumers are quite as conservative, not only in dealings in spot stock but in venturing with future deliveries. A Western concern, however, just embarking in the manufacture of Tin Plates, is reported to have taken between 40 and 50 tons for immediate delivery on Thursday. Jobbing prices for small lots have been moved up to 20½¢ @ 21¢ for Straits Pig, with a cent in advance for Bars. Banca is quoted at 22¢ per lb.

Copper.—There has been considerable effort in the way of raising quotations, and the effort has been rewarded in a certain degree, but a good part of the wholesale business is reported to have been done at the former low figures, in the face of higher public bids. To all accounts, home consumers are liberally supplied with stock sent forward on previous orders, and it is plain that heavy consignments of late afford European buyers a full supply. Nothing new is divulged as to the efforts to effect a combination to restrict production and regulate prices. In small lots there has been no change, either in the general demand or in price, which remains on a basis of 101 % In for Lake Ingot.

Sheet Copper.—Consumers, within the last few days, have been evincing some revival of interest in Sheet Copper for cornice work. Inquiries have been decidedly more numerous, and while the nine conservative users seem inclined to await definite developments in regard to the tariff law and the effect of its final passage on general business, before placing their orders, some are already ordering more freely. Prices for small lots show no change from former quotations.

Plg Lead.—There has been a gradual fall in prices due chiefly to more liberal offerings of stock for delivery during the next 30 days and somewhat strained reports sent westward as to probable importations of foreign Lead under the provisions of the new duty. In small lots prices are unchanged at  $3\frac{\pi}{8}\phi$  @  $4\phi$   $\beta$  lb for American Pig, while the demand is of routine character.

Lead Sheet and Pipe - Very little improvement can be noted in the de-

mand for Manufactured Lead, although a rather better feeling is observed, especially in the Plumbers Supply trade. Prices are still very low, but it is thought that rock bottom has been reached, and that any future movement will be in an upward direction. A rather freer inquiry is reported.

Spelter.—Purchases here have been strictly routine and moderate, all told. The demand has not improved. Deliveries are not particularly prompt and some receivers state that shipments hence from the West are annoyingly backward. Prices for small lots have undergone no change.

Sheet Zinc.—No change has taken place since our last report either in price or in character of the demand, which continues limited.

Antimony.—The market remains that, there being merely a routine consumptive demand, and prices rather weak. For small lots from stock the following figures are quoted: Hallett's,  $9\frac{1}{2}\phi$ ; Cookson's  $10\frac{1}{2}\phi$  @  $10\frac{3}{2}\phi$   $\stackrel{?}{\sim}$  lb.

Tin Plates.—Quite a good business has been done in forward deliveries at prices based upon the prospective new duty, with proper contract terms. The movement was chiefly in stock for delivery during the last quarter of the year, including Bessemer Coke finish at \$3.80 for 100 lb, Siemen's at \$3.90 @ \$3.95, IC Charcoals at \$4.65 @ \$4.67\frac{1}{2} for \frac{1}{2} X. Assortment and other varieties at corresponding prices. The demand for spot goods has been a little more active, but consumers are not likely to purchase much beyond their actual current needs in view of the certain lowering of prices after October 1, if the new tariff bill becomes law. Under existing circumstances, there-fore, buying is likely to be limited in extent during the next five weeks, and importers will not be apt to retire more goods from bond than necessary, until they can avail themselves of the lower duty. Importations from this time on till the end of September will also be moderate. There is a very fair routine demand in this market for domestic Roofing Plates, especially those of a high grade. Prices show no radical change.

A special cable dispatch from London to The Iron Age, dated August 22, reports on the British Tin Plate market as follows: Tin Plate has been in active demand from America and elsewhere since the pas sage of the tariff bill, but the prices offered were below makers' views, and only a fair business was effected. Some makers have advanced prices from 6 pence to 2 shillings, and it is impossible to quote values accurately at the present time. Swansea quotations to-day are about as follows:

Bessemer Cokes, 14 x 20	107
Slemens Cokes, 14 x 20	10.6
Ternes, double box @	
Charcoals	14/

Sheet Iron.—The Sheet mills are all busy, and manufacturers' agents appear to be well supplied with orders. Galvanized Iron is more active, and jobbers report somewhat more interest in Black Sheets in small lots, though prices are still unsatisfactory and give no sign of any present improvement. Almost all the business doing is in lots for spot delivery, only limited forward dealings being noted.

THE FEATURE of the advertisement elsewhere of the Magee Furnace Company, Boston, Mass., is a letter from a customer in Rhode Island relating to

the Magec Grand Range and speaking in the highest terms of its popularity and efficiency.

### Chicago Report.

Scrap.—Only small sales are reported. Dealers quote the following list of buying prices, Chicago delivery:

THE SILL STOVE WORKS OF Rochester, Y., and with Western branch in Chicago, Ill., according to an announce ment elsewhere, are offering the trade this season four sizes plain of the Sterling ventilator square parlor heater and one size with oven. The ornamentation is of high order, the proportions are graceful and the constructive features of the most approved pattern. company are also making the Silver Sterling in two sizes plain and one size with oven. It is an attractive parlor stove with liberal mica illumination and decorative treatment, involving a judicious combination of nickeled parts with black iron surfaces. The goods of the company are popular with the trade and a constantly increasing volume of business is expected.

The Cleveland Foundry Company, Cleveland, Ohio, call attention elsewhere to the Puritan Oil Heaters, made in six sizes. The Nos. 44, 74 and 64 Heaters are illustrated and prices given. A list of branch houses and wholesale agents is appended showing where these goods may be obtained in all the prominent cities of the country.

### CONDITION OF THE

### Hardware Trade.

Since our last a tetter feeling has pervaded the whole trade. Travelers are sending in more favorable reports and orders have been more unmerous and for larger quantities. If this improvement should continue the fall trade will turn out much better than scenied probable a short time ago.

Advices from Chicago.—The Shelf Hardware trade shows some improvement. The demand for fall and winter goods now begins to figure in the orders received. Stove Boards, Coal Hols, Elbows and Stove furniture generally are moving to some extent, but not in large lots. Orders are small and almost invariably call for broken packages, causing much trouble and expense in packing departments. House furnishing goods are also in greater demand in the aggregate, but are called for in the same way in broken packages. Staple goods are picking up, but little inclination is shown as yet to lay in stocks or anticipate wants. The small size of the orders shows that goods are only being bought to meet the current demand, but the increased volume of business shows that the demand is steadily growing. Imported Tin Plate is advancing in price. Brokers' quotations for Chicago delivery, subject to duty, are about 30 cents per box above recent prices. Roofing Tin is in excellent demand, as well as Sheet Copper for cornice work. The Heavy Hardware trade runs along in fairly good condition. Orders in this line are also small, but latterly a tendency is shown to inquire for prices on larger lots, as though some consumers were getting the opinion that it would be a good time to lay in stocks of staple sizes and brands.

### Notes on Prices.

Wire Nails.—Since our last several mills have started and others are reported as preparing to go into operation. The demand is good, but this has had no effect in advancing prices. Carload lots at mill have been sold quite freely at \$1 @ \$1.05 The New York price for small lots is \$1.20 @ \$1.25.

Advices from Chicago. — Manufacturers' orders have increased heavily within the past few days. They assert that more business is in sight than at last year at this time, with practically no stocks to draw upon. They quote \$1.15 to \$1.17\frac{1}{2}, Chicago. Small lots from stock sell at \$1.20.

Cut Nalls—In this line both demand and production are increasing, but without improving the tone of the market as far as prices are concerned. We quote as representing the Eastern market 90 to 95 cents for carload lots on dock. The store price for small lots in New York is \$1.05 to \$1.10.

Advices from Chicago.—Orders are small and only intended for sorting up. Manufacturers in this line have not yet begun to feel the movement of fall trade. Quotations are ateady at 95 cents, Chicago, for 60 cent average. Small lots from store are selling at \$1.10 to \$1.15.

Barb Wire.—The Eastern demand continues very small, but reports from the West are more encouraging. In prices the market shows little atrength. The following are the quotations for Four Point Galvanized delivered at the points named: Pittsburgh, \$2 to \$2.05;

Cleveland, \$2.05 to \$2.10; Cincinnati or Allentown, \$2.20 to \$2.25; Chicago or New York, \$2 20 to \$2.25.

Advices from Chicago.—Jobbers are having a steadily increasing demand. Manufacturers seem to be waiting until trade grows to larger dimensions before they resume operations to any extent. Prices are firm, and large buyers acknowledge that they have been unable to secure concessions. Jobbers quote small lots of Galvanized at \$2.35, with 10 cents off for carloads.

Wrought Iron Pipe.—This line of goods seems to be suffering a reaction from its recent strength. Orders are not very plenty and manufacturers are pressing on the market. As a result prices have softened about 5 per cent.

Sturges Steel Churn.—This Churn was described in our last issue. It is manufactured by the Chicago Stamping Company of Chicago. The Churn is sold to the trade from the following list, subject to a discount of 20 per cent.:

No. 1, 9 gatton Churn, churus from 1	
to 4 gallons of cream	\$6.00
No. 2, 15 gallon Churn, churns from 2	
to 7 gallons of cream	-9.00

Bread and Cake Knife.—Aluminum Novelty Company, Canton. Ohio, are putting on the market Ball's Diagonal Corrugated Bread and Cake Knives. The Knives are sold to the trade at the following prices, which are net.

No. I. Bread Knife, polished steel	t doz.
blade No. 3, Bread Knife, nickel plated	\$1.50
No. 4, Cake Knife, nickel plated	$\frac{1.80}{1.50}$

Acme Steam Glue Pot and Stand.—Stuart & Peterson Company, Burlington, N. J., are manufacturing this article. It is sold from the following list, which is subject to a discount of 10 per cent. to the trade:

Each.

No. I, holding 1 pot	\$9.50
No. 2, " 2 pots	16 50
No. 3. " 3 "	25,00
No. 4, " 4 "	32.00
No. 5, " 5 "	
No. 6. " 6 "	
Glue Pots without frame	5,25
Inside Kettles, holding 5 qua-	

Glass.-No change of importance has taken place in the Glass market during the past week. Demand continues light and prices unsettled. Although there have been two conferences between the wage committees of the manufacturers and workmen, no agreement has been reached as to the wage scale for the ensuing fire. Conservative jobbers are not making large purchases at current quotations, and in Glass circles it is generally supposed that factories will make an early start. The New York market is represented by discounts of 80 and 20 to 85 per cent. Pittsburgh factory quotations in car lots are reported as being 85 and 5 per cent. for single and 85 and 10 per cent. discount for double strength Glass, while Pittsburgh prices for small lots of Glass are 80 and 10 per cent. for single and 80 and 20 per cent. discount for double. Imported Glass is still quoted at 80 and 10 per cent, discount.

### FLASHINGS.

A LOCAL PAPER published at Madoc, Ontario, gives an extensive article relating to the Actinolite Works at Bridgewater owned by Joseph James. Actinolite is a fibrous mineral related to the hornblende family and closely allied to asbestos, which is used with excellent results, so it is stated, in roofing. In the article mentioned there is given a list of buildings that have been roofed with this material both in Montreal and Chicago.

C. MACKINTOSH, 61 Beekman street, New York, has added the Hastings quadruple roofing folder to his line of tinners' specialties. He has secured the territory of New England, New Jersey, Pennsylvania, Maryland and Virginia, and will also sell in New York State.

R.J. LETCHER & Co., 310 Grove street, Jersey City, dealers in tin plate, solder, sheet iron, &c., find some trade for terne plates with the edges all folded ready for the roofer.

DAVID LUPTON'S SONS, 2611-15 Coral street, Philadelphia, have commenced to manufacture corrugated conductor pipe. With the facilities at their command they should have little difficulty in making a success of their new departure and building up a large trade.

Among the contracts recently taken by James A. Miller & Bro., 129-131 South Clinton street, Chicago, can be mentioned the following: Slating and tinning work for houses of E. Hoffman and Mrs. Gillman, 458-460 Wabash avenue; slating, tinning and galvanized iron work for block of three houses of A. W. Rolason, Calumet avenue near Thirty-second street; tile roofing, &c., for residence of W. II. Winslow, River Forest, Ill.

galvanized from work for the school building at South Evanston and the Hinsdale High School.

Knoor & Blocks, 165 Wells street, Chicago, are to furnish the galvanized iron cornice, skylights, bay windows, &c., for the apartment building of A. Wiegand, La Salle avenue and Huron street.

The Delaware canneries are reported to be all running on full time, and business is much better than was anticipated. The failure of the peach crop, however, will take more than \$1,000,000 away from the Peninsula, which would have gone there had the crop been a good one.

#### Cooking by Electricity.

It is stated that the ratio of cost of heat for cooking purposes as delivered from central electric stations by means of electrical appliances, which convert electricity into heat at any point desired, has been reduced until it now compares with heat produced by burning coal in cooking ranges as seven to four. That is to say, heat for cooking can now be obtained from electrical currents at somewhat less than twice the cost of ordinary fuel used for the same purpose. Probably this estimate is only justified by taking into account the heat wasted in getting coal fires into condition for cooking and that which also wastes while the fire is go ing out. The advocates of the newer method hold that electricity is hereafter to be a more or less formidable rival to gas for summer use in cooking. Although with the modern improved gas stoves most excellent work in all kinds of cooking, from broiling to baking, is possible, there are those who have used both systems who confidently assert that, as compared with results obtained in electric cooking, gas is interior. If this assertion be true (which many who have used gas stoves will hardly think possible), it can only be accounted for by the accurate regulation of temperature which electric heating apparatus permits. Yet the temperature of ovens in gas stoves can now be regulated with such precision as seemingly to leave nothing further to be desired, and hence we are disposed to discredit statements as to the great superiority of electric cooking as compared with that done in gas stoves. It is hardly possible that in point of cleanliness the electric cooking apparatus can exceed in any notable degree the best types of gas stoves, since all the dirt that accumulates about either of them results from drippings from the articles cooked upon them, these being more or less according as the operator is careful or otherwise. There is, seem-

ingly, a tone of exaggeration in many of the statements made and published with reference to electric cooking. Probably these are attributable partly to the zeal of those who are commercially interested in the manufacture and sale of electric cooking apparatus, and partly to the enthusiasm of those whose interest in a novel method somewhat beclouds their judgment.

### Improving Trade in the West.

The West reports considerable improvement in general trade. Merchandise of all kinds is in greater demand. and in some lines the prospects favor the largest movement for years. Railroad traffic has picked up remarkably, and on some lines a shortage of rolling stock is reported. The settlement of the tariff question is assigned as the main reason. The country has been kept bare of manufactured goods for a year or more, pending changes in duties, and now many merchants are disposed to return to their usual custom of carrying at least a reasonable stock, especially of such goods as are not affected by tariff changes. The strength of this impulse to trade cannot be estimated and opinions vary greatly. Some look forward to an immediate return of prosperity, arguing that an immense volume of business has been dammed up by the long prevailing uncertainty which will now precipitate a flood, with beneficial effects to follow for many days. Others, however, take a less sanguine view of the situation and think that the increased movement will soon spend its force, when trade will relapse into its old state of dullness. But no one can accurately forecast the future. Experience does not teach in this instance. because the conditions recently existing have been unparalleled.

### Existing Destitution.

If the improvement is permanent, and from this time forth business be restored to its normal condition, the entire nation will have reason to be profoundly thankful. Another winter like that of 1893-94 would bring even greater privations upon the unemployed, because savings have been more generally eaten up and the generous have less to spare to help their suffering brethren. A foretaste of what may be expected this winter if the hard times continue was given last week in Chicago. The Rock Island Railroad needed a moderate force of laborers to begin work on elevating their tracks, but on the day advertised the foreman in charge was dismayed to find a mob of several thousand men in waiting for a job. They became so riotous when not employed that it was necessary to call for

a large number of policemen to prevent them from doing violence to the fortunate few who had been put to work. Further, the destitution among Pullman strikers has been so great, and their trades union confrires have been able to do so little for them, that the Governor of Illinois felt impelled to issue a proclamation asking for assistance in their behalf in the name of humanity. Every industrial community is carrying a burden of this character to-day, and a revival of business cannot come too soon to bring relief.

#### The Tin Plate Tariff.

The initial effects of the new tiu plate tariff are shown in the closing down of all the smaller tin plate "dipping" works in this vicinity, a proceeding which will, doubtless, generally be followed by these establishments in other quarters. The ground seems to have been completely cut from under the feet of these and similarly placed establishments unless, indee1, the price of domestic black sheets is very materially reduced; as, under the revised tariff, they cannot afford to buy the imported article and dip it, so as to sell their product in competition with the foreign tin plates imported under the new duty of 1.2 cents per pound. The only other way of escape for the American dipper making the cheaper grades of plates would be if the Welsh manufacturers plucked up courage to raise their prices for the finished plates sufficiently high to approximate the possible prices at which American black plates can be profitably coated and sold here. It seems hardly likely, however, that our Welsh competitors would pursue so shortsighted a course in respect to their own interests after all they have suffered from the recent restriction of American orders.

The returns received at the office of the Controller of Currency at Washington of the amount of gold held by the National banks of the United States in July show that the New York State banks held \$80,104,000, or \$25,000,000 more than the gold reserve of the Treasury. The next three States on the list are Illinois, with \$26,406,000; Pennsylvania, with \$21,296,000, and Massachusetts, with \$11,915,000.

The palatial headquarters of the Knlghts of Labor in Philadelphia, having been found too expensive to maintain, has been given up. It will, by a strange irony of fate, be opened on Labor Day as a conservatory of vocal and instrumental music and so harmony will prevail in the place which has of late witnessed so much wrangling and diacord. Washington, it is said, will be the future headquarters of the organization.

tank under the ceiling if it were possi-

ble to put it on the joist above. Even if he could not place it above the bath-

room he could carry the water over with the supply pipe and have that much better head of water. If he can

place the tank above the joist, make the

tank as large as possible, of  $1\frac{1}{3}$  inch atuff, well put together and lined with copper or sheet lead; 10 or 12 ounce soft copper will do if well put in. Make the tank as deep as he can, as the deeper the water in the tank the better

pressure he will have. If he cannot place the tank above the joiat he had better make the tank round, as it will not take up any more room and will not bulge at the sides the same as a square one. He should use at least \(\frac{1}{2}\)-inch plpe for so small a head to anpply his boiler and be careful that he does not reduce the size with solder nipples that are not full size. I would suggest

# THE LETTER BOX.

### Recording Stove Sales.

From W. O. A., Roxbury, N. Y.—In The Metal Worker of August 18, "S. F. F." asks for a stove record. Below is a copy of one that I have used for ten years, which has saved me no end of trouble in ordering repairs. I know how many stoves I sell each year, also

tary matters. This spring water is very clear and sparkling and has started me to effervescing also, and if "C. F. B." was here and expanded by the grandeur of the locality he could absorb all that I could give him, affording me some pleasure and him, I hope, some information. A vacation is a good thing to take and don't cost half what it's worth.

Date.	No.	Purchaser.	Name of Stove.	Size.	Remarks.	Price
1803. Dec. 13 Dec. 21 Dec. 28 1894. an. 5 an. 13	37 38 39 40 41 42	John Smith	Mohawk Star Glen Andes	10 91/18 49 14 9 142	Duplex grate, 1891 Ret. flue Basket grate Double heater	12 ( 30 (

amount of sales. I begin the year always September 1, the first stove sold after this date being number 1, &c. I use an ordinary blank book  $4 \times 7$ .

### Raising Water by Compressed Air.

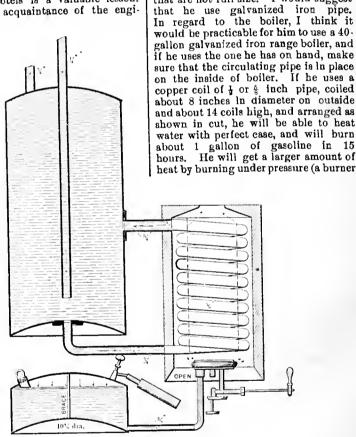

From B. B. M., Nevada, Ohio.—I am informed that there is an apparatus or system that will take water from a well or cictern and force it through a building so that on opening a faucet water runs, yet it is not a pump. I do not want a water motor. I am told the apparatua which has been described to me is called a water mover. I should be glad to get the address of the makers.

Answer.—A system for raising water by means of compressed air is perhaps what our correspondent refers to, and the apparatus necessary can be supplied by Kirtley Bros., Kansas City, Mo.

### Location of Fresh Air Inlet.

From G. W., Saratoga Springs, N. Y. —I am on my vacation and had my Metal Worker sent to me here, so I read "C. F. B'a" inquiry of August 25, and concluded that as the fresh air here was doing me so much good I could afford to blow a little of it his way. A fresh air inlet placed as he has it would not serve the purpose for which it is intended and would be of no use that his trap vent and back air pipe do not serve. The fresh air inlet should be placed on the house side of the trap on the pipe as it leaves the house to the sewer. serves a greater service in letting the air in the pipes get out when a fixture is flushed, otherwise the seal of the trap might be broken by compression of the air and possibly be destroyed by oscillation so that the odors would enter the building. It also affords a ventilation through the whole system of soil pipes when the back air pipe terminates above the roof, preventing an accumulation of foul air in the pipes. A fresh air inlet arranged as "C. F. B." has it would serve none of these purposes. It is odd how a fellow is disposed to talk "shop" on all occasions, but even if I am in the Park taking my Congress water I would be more than glad to have "C. F. B" here so I could lecture to him on sani.

Why, to study the plumbing in some of these big hotels is a valuable lesson. I made the acquaintance of the engi-

Heating Water for Bathrooms.

neer and have been all through and have seen several little kinks that are going to make me some money and have seen some bad botches as well. You can't learn it all in the shop and on your own work.

### Heating Water for Bathrooms.

From "S. M. E.," Rondout, N. Y.— In answer to "F. J. L.," Lawton, Mich., in The Metal Worker, August 4, I will try to help him out. The coil that he proposes to use will not heat sufficiently for what he wants. This I know from practical experience. In the first place, I would not place the that burns from natural pressure will not heat enough), but must have all connections tight. He can use any independent burner with a sawed burner cap; the ones with the holes in will not work, as they will blow out. He can get a suitable burner of the Lansing Stove Company, Lansing, Mich., and the filling caps and air valve of the Union Heater Supply Company, 88 Congress atreet, Detroit, Mich. He should get the air pump of a bicycle concern, but should not try the rubber bulb, as they do not last. The air pump should be connected to air valve with rubber tube, and wheel tight. The tank must be made strong with bottom and top raised,

as per cut, with piece of \$\frac{a}{5}\$ inch pipe through center for a brace, or it will not stand pressure. A Teed milk can bottom will make a good job for the top and bottom. They will double seam  $10\frac{7}{5}$  inches in diameter. They can be bought of the Buhl Stamping Company of Detroit, Mich. He can get the coil of the National Pipe Bending Company, 65 Lloyd street, New Haven, Conn. He must be sure and have his couplings brazed on coil instead of soft soldered on. This will make a first-class job and one that will heat quickly and be perfectly safe to use. In filling tank use 1 gallon, leaving rest of room for air. The pressure will last about three hours.

#### Construction of a Pantograph.

From G., Waterloo, Ioua.—Will The Metal Worker publish a description of the pantograph? I wish to make one, the bars of which will be 3 feet in

is to be placed. The instrument can be supported upon small castors or feet, which should move freely in all directions. In the cheaper forms of the instrument it is supported by the fulcrum A, pencil G, tracing point C and a screw eye at B. With the fulcrum at A, pencil at G and tracer at C, the instrument moving on the points or pivots E, B, F and D, it will be seen that G is exactly half way between C and A. C will then travel twice as rapidly as G, or over twice the distance. Thus the pencil at G will produce a copy half the size of the original traced over by the point C. If the tracer is placed at G and the pencil at C, the copy produced at C will be twice the size of the original at G. If we place the fulcrum at G and the pencil at A, the copy will I

with A B. We have thus secured the points E, B, F and D, upon which the instrument is pivoted. The points A. G and C are used as previously described. To secure the points for a one-third reduction, bisect  $\Lambda \to a$  and d aw a C, thus securing the point g in E G, a g being one-third the distance a C. For a one-fourth reduction, divide A E into three equal parts, and from E set off one of these divisions at a'. Draw a C, thus securing the point g in E D, a' g' being one fourth of a' C. For a one-fifth reduction, divide A E into four equal parts, and from E set off one of these divisions at a". Draw a C, thus locating the point g'' in ED, a'g''being one fifth the distance a" C. It will be seen that the distance A E is to be divided into one less number of parts

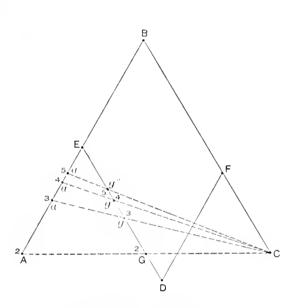

Fig. 1.-Method of Obtaining Points.

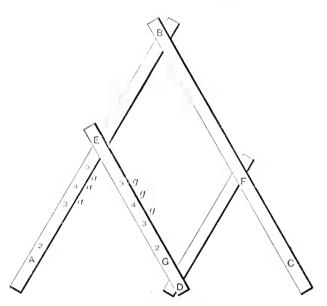

Fig. 2.—The Compteted Instrument.

### CONSTRUCTION OF A PANTOGRAPH.

length. The point upon which I need information most is just where and at what distances to bore the holes.

Answer .- A form of pantograph commonly used is shown in Figs. 1 and 2 In Fig. 1 is shown the principle of construction, by mesns of which it is hoped our correspondent will be enabled to make one of the required dimensions. It is composed of four bars, A B, B C, E D and D F, joined to each other at the points E, B, F and D. These joints have to be made with care, as upon their accuracy depends the success of the instrument. At point C is fixed the tracing point, which can be made of steel or brass. For reducing, the tracing pencil is fitted in the holes in D E. The fulcrum, which can be a flat leaden weight with a brass stem rising out of it, fits in the holes in A E. This weight can have a number of fine points upon the under surface to keep it from moving upon the paper. If desired, the fulcrum can be made of a block of wood secured to the drawing table by means of screws. In this block the brass pin

be the same size as the original, only reversed. If a copy one-third size is desired, the fulcrum must be placed at a and the pencil at g, a g being onethird the distance a C. As the instru ment is generally constructed, the proportion of the bars is of no consequence, providing B F is equal to E D and E B to DF, thus producing a parallelogram. The rule for all proportions less than one-half is as follows: As the distance of the pencil (on E D) from the fulcrum (on A E) is to the distance of the tracer (C) from the fulcrum, so will be the size of the copy to the original.

The diagram shown in Fig. 1 has been constructed in such a manner as to enable one to determine the various points, and for an instrument of any size. Draw any line, as A C, and with A and C as centers, and A C as radius, strike small arcs in the direction of B, thus securing the point B. Draw B C and B A. Bisect A B in E and draw E D parallel with B C. From a convenient point, as D, draw D F parallel

than there are parts in the reduction. One of the divisions set off from E and a line drawn from the point thus obtained to C will give the corresponding point on E D. In all cases the fulcrum, pencil and tracer are to be in line, as indiested by the dotted lines drawn from the points in A E to C. With the fulcrum placed in A E, the pencil in E D and the tracer at C, the drawing will be reduced as indicated by the corresponding figures in A E and D E. With the fulcrum placed in A E, the tracer in E D, and pencil at C, the drawing will be enlarged as indicated by the corresponding figures in A E and D E. In Fig. 2 the four bars of which the instrument is composed are shown in position, the various points being the same as in Fig. 1 and indicated by similar letters.

### Makers of Pinking Machines.

From K. S., New York.—Please inform me through the columns of The Metal Worker who make pinking machines for cutting out facings on over-

coats and fancy work on leather dog collars.

Answer. - Machines of this sort are made, we believe, by C. S. Osborne & Co., Newark, N. J., and also by the Ames Mfg. Company, Chicopee, Mass.

### Cleaning Sink Pipe.

From C. B. G., Bridgeton, N. J.—Will The Metal Worker please tell me what is best to use to clean out sink pipes when they get filled with slime? I think I read some time ago about using potash or chloride of lime.

Answer .- In The Metal Worker, November 25, 1893, we stated that it was a common opinion that the only proper way to clean such a pipe was to open it so that a brush or swab could be used to clear it. Sometimes a strong solution of lye is used. This will get the accumulation loose at the upper end, but is likely to stop up the pipe below. If the pipe then has to be opened for clearing the workman must be careful or the strong lye is likely to burn his hands when the opening is made.

### Stoves and Tin.

From C. T. S., Baltimore, Md. -I am going to write about stoves and tin, for what I have to say will thus attract the attention of a good many of your readers who are in that line of business, but it by no means applicable to their line of business alone. In our section we used to buy a stove that was listed at \$16 and on which we got a 20 per cent. discount, and as we were generous we used to retail it at \$15. Well, for some unknown reason the stove founders concluded they would do a little better by us, and they gave us a 25 per cent. discount. Then the news got out that stoves had come down, and the busybodies went around pricing, and as we had concluded to keep that little drop to ourselves they found prices were just the same. Some of the dealers could not stand this pricing and pricing and no sales, so they admitted that stoves had come down and sold the stove at \$14. I went and asked one fellow why he came down.
He said he had to; that people knew there had been a drop and they wouldn't pay the price. Then I asked him why he had come down in his price more than the stove had, and the chump was too dumb to figure what 5 per cent reduction meant, and hadn't bought a stove or got a bill since the change in discount and didn't know that it only amounted to 80 cents. Well, all the other fellows came down, and some went a little better, till the stove sold for \$12 50 with pipe, delivered and put up. Then everybody tried to get the exclusive sale for some similar stove and sell it at a higher price, but the people wanted the other stove, and finally the trade growled that there was no money in stoves, anyhow, so they wouldn't keep any of the \$12.50 brand in stock.

Now you would think that the trade would have learned their lesson from this, but they hadn't, for when the foundries got to cutting each other to meet the demands that grew out of the first reduction they all concluded to sell at 30 per cent, and stop the cutting that was shifting the trade from one foundry to another. Everybody was happy when they heard of the 5 per cent. reduction, but it makes me so mad when I think of how the whole thing | was gone through with again that I shall not describe the second experience which was as bad as the first.

Now the tin dealers are facing music that they won't like to hear. You see when McKinley made the tariff \$2 or thereabouts on a box of tin they put the price up, and the fellow who was buying big lots for making tinware commenced to fret, and gradually the price got down somewhere near the old figure again. Now if Wilson cuts McKinley's tariff in two, why the buyer will want that \$1 a box right away, and as he has had \$1 already there is a picnic abead. The manufacturer won't lower the price of his tinware if he can help it, but he'll have to, as there will be a fine old noise if he don't, for the public will know all that happens and will demand that prices come down. So what is he going to do about it?

### Suburban Plumbing.

From A. P., New York State.-I would like to have some information on setting water closets. I notice openings for two connections on the closets at the back. I suppose the lower opening is to receive the flushing pipe from the tank above and the upper opening is for connecting a pipe to ventilate the closet. Is this supposition correct? Should the supply pipe to the flush tank be taken as a branch from the main water supply pipe which runs across the cellar and then run up and connect with the under side of the tank? The range boiler and system are to be supplied from a 20-barrel tank in the attic. How shall I connect the outlet from the closet to cesspool? I wish to use a 4-inch lead S-trap directly beneath the closet and run the pipe to the cesspool, using 4-inch vitrified sewer pipe. Should a trap also be placed on the line of pipe to the cess-

Note.-The information sought is usually gained in practice with an experienced plumber as instructor, and only secured after a long service; consequently it is difficult to furnish an answer that will be entirely satisfactory. It will be of advantage to our correspondent to visit some water closet in operation and closely examine all of the details of its connections. The upper opening that he mentions is usually for the flushing pipe and leads into the flushing rim of the closet and provides for scouring every part of the bowl. The lower opening is for ventilation and to protect the water seal of the closet from being destroyed by siphonage. As the flush tank can in no way contaminate the water supply, a branch from the main may be run to it from the most convenient point, using a ball cock to control the supply. The tank in the attic, if kept supplied, will be all that is necessary for the system. The lead S-trap should be connected with a cast iron soil pipe of at least medium weight, which should run through the roof and through the cellar wall, after which it may be connected with a vitrified plpc, providing it is laid on a good foundation and the joints securely made. A trap should be placed on the pipe just before it enters | for refrigerators in New Zealand.

the cesspool, and a fresh air inlet should be placed on the pipe near the trap, but on the side away from the cesspool. The cesspool is the least desirable feature of the system and should be avoided if possible to connect with a sewer. The use of a tank suggests that there may be wells near by which may be polluted by the liquid filtering from the cesspool. The cesspool should be located as far as possible from all buildings and be frequently cleaned.

#### Underground Temperature.

At the meeting of the British Association a report was presented by the Committee on Underground Tempera-The nineteenth report contained the results of observations taken in 1891, by Mr. Hallock of the Smithsonian Institution, at depths extending to 4462 feet in a nearly dry well at Wheeling, Va. When the observations of ing, Va. When the observations of 1891 were finished, an oak plug was driven into the top of the casing to protect the hole. In July, 1893, the plug was withdrawn, and the well, instead of being dry as before, was found to be full of fresh water to within 40 feet of the top. This water was believed to have leaked in at the lower and of the invergence could at 1570. end of the innermost casing, at 1570 feet below the surface. By means of inverted Negretti maximum thermometers, protected against pressure by stout glass tubes, careful observationa were taken at various depths from 1586 feet to 3196 feet, two thermometers being employed to check one another at each depth. The results were prac-tically identical with those obtained two years previously, when the well was full of air, the greatest certain difference being only one-fifth of a degree. The temperatures at 103 feet, 206 feet and 300 feet were also observed with suitable thermometers, the temperature at 103 feet being 52.53°, which is 1.2° higher than the true temperature of the soil at that depth, as determined by other observations in the immediate neighborhood.

A Washington dispatch gives a review of some of the changes in the condition of the Treasury for a year or more which presents some points of interest. It is shown, for example, that while the Treasury cash balance, in-cluding the gold reserve, decreased from about \$129,000,000 on January 1, 1893, to about \$90,000,000 on January 1, 1894, it increased to \$119,000,000 on August 1, 1894. The fact that an increase appears on the latter date is, of course, due to the proceeds of the bond issue, which were covered into the Treasury early in the year. The expenditures have exceeded the receipts of the Government in every month since the beginning of 1893, with the exceptlon of March, May and June, 1893, and June, 1894; and while the excess of receipts over expenditures has been small, the excess of expenditures over receipts has, on the other hand, been

Austria has been making considerable strides of late years in the manufacture of tinware, with which her factories supply the countries of Eastern Europe to a large extent.

There is a large and growing demand

## STEAM AND HOT WATER.

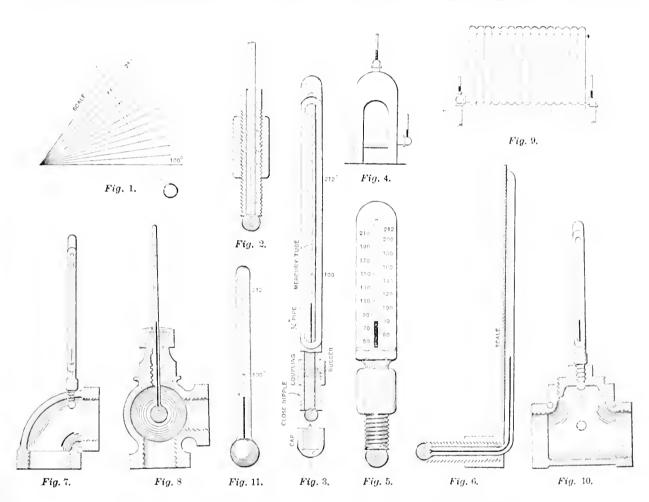

Home Made Thermometer for Hot Water Heating Apparatus.

BY J. L. BIXBY, JR.

Secure from a dealer one or more mercury thermometers, such as come in japanned cases and retail at 25 or 30 cents, or higher priced ones if accurate results are required or desired. As these thermometers vary greatly in length the longer ones should be chosen, for a reason that will be obvious from

The 100° mark should have a cross or something to distinguish it at a glance and to facilitate reading and placing of universal scale. This scale is made, as shown in Fig. 1, by marking from a given point a lot of radial lines an equal distance apart, each space representing five or ten points. Calling the base line 100°, and each space 5°. the twenty-second line would represent 210°, and a distance of two-fiths of a space between this line and the twenty-third line would be the 212°, or boil-

This will save considerable trouble, cost the least and maintain accurate results. Having the tubes, the casings are made of common brass pipe and fittings, or iron for that matter, except that it is subject to rust. The construction of the case is better illustrated than described. Fig. 11 represents the tube. Fig. 3, A and C, represents a tube incased in one-eighth brass pipe, a coupling and close nipple, with a pin of pure rubber that fits the tube tightly and is expanded against both the tube and

HOME MADE THERMOMETER FOR HOT WATER HEATING APPARATUS.

what follows. Having secured the thermometer, remove from the case the scale and tube. This done, mark on the glass tube with a file or diamond point every five or ten points from 80° or 90° up, also the 212° point, all corresponding to the divisions on the scale. In each five-point mark put on a little black ink, and on the ten-point marks put red ink, or vice versa. If the thermometers are to he used on eighth pipe or in air cock holes, the bulb of the thermometer should not exceed  $f_5$  inch in diameter. One of the principal objects in marking the 212°, or boiling point, is to use it as a data point on which the scale is based. The 212° and 210° marks coming so near together they are easily distinguished.

ing point. If each space equaled 10°, one fifth the distance between the eleventh and twelfth line would be the 212° point.

Having made the scale as described, its use is as follows: The base line is put under the 100° mark, and the 212° line under the 212° point. The intermediate points can be read from this scale, which can be made to read single degrees if desired. It is well to make the scale on light cardboard and cut it out in the triangular shape in which it is drawn. If more than two or three thermometers are to be made, it will be well to order them direct from the manufacturers, advising them for what purpose they are to be used, the size desired, and have them scale the tubes.

coupling by acrewing down the casing. The cap C is made of a coupling with the end plugged and the whole filed off round. The top of the casing is finished in a similar manner.

Having found the length of pipe to be used for the case, remove the tube and file or cut away about one-half of the pipe so as to show the thermometer, as illustrated in the engravings. The thermometer, Fig. 2, is practically the same as the one above mentioned, except that it has no casing. Fig. 5 shows the scale that came with thermometer, bent at right angle and soldered on a plug of one-eighth size, or a bushing of one-quarter size. With this thermometer be sure the packing is tight before the scale is set. Fig. 6 is a tube

bent at right angle and scale soldered on to coupling. Fig. 7 shows the application of the thermometer to an elbow. Fig. 10 shows by dotted lines the correct position of the bulb. It should never be placed as indicated by the cut, as this span is generally an air chamber, and water flowing through the fittings would not touch the bulb. Fig. 8 shows the application of the sealed tube for testing water in valves, a large, thick rubber washer being used in the stutling box. Fig. 9 shows the application of the thermometers to testing hot water radiators, and Fig. 4 their application to a boiler.

### The American Air Valve.

The accompanying illustrations, Figs. 1 and 2, show respectively general and sectional views of the American positive

The American Air Valve.-Fig. 1,-General View of Valve.

and automatic air valve manufactured by Pierce, Butler & Pierce Mig. Company, Syracuse, N. Y. The device can be used as either an automatic or positive valve without any change whatever of adjustment. Attention is called to the manner in which the expansive valve stem is automatically mounted in the positive valve operating piece. It is evident that the socket of the operating piece is of sufficient depth to keep the expansible valve stem in perfect alignment with the valve seat, and owing to the bearing face which forms the inner

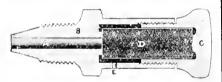

Fig. 2.—Sectional View of Valve.

wall of this socket the expansible valve stem may be adjusted lengthwise without turning on the valve seat. feature is referred to as of special advantage, as when the valve seat is incrusted with grit, rust or other hard substances the expansible valve stem can be brought with great force against the valve seat without injury to either. In the American the expansible valve stem is formed of a specially prepared composition manufactured, we understand, expressly for this use, so that when the valve cools and this stem contracts it allows the admission of air into the radiator and prevents the formation of a vacuum.

### Pressure Regulator and Returning Condensation.

From F. B., Massena Springs, N.Y. I would like some information on the use of a pressure regulator or reducer on a one pipe steam heating plant. Will the condensation return to the boiler by gravity where one is used? claim it will not, as the pressure on the

ence in hight between the water line in boiler and the lowest radiator is 5 feet. The boiler will carry a pressure of 40 pounds for power work, and only 4 or 5 pounds will be carried on the heating system for the house.

Answer. - If the regulator is to be used on a strictly one pipe system and the water of condensation is to be returned to the boiler through the steam main leading from the top of it, the regulator will prevent the water from returning, just the same as a stop cock would. If the cheek mentioned is a valve placed in a pipe sometimes used on a modified one pipe system, which receives the re turn water and carries it to the boiler below the water line, the water could not be returned for another reason. In such an arrangement of piping whatever pressure was carried on the beiler would be exerted on the boiler side of the check valve; and as a much less pressure would be exerted on the other side, the water could not pass through. If the check valve was renewed back pressure would drive the water out of the boiler up the return pipe. If, instead of the return pipe being connected with the boiler, it is connected to any one of several makes of intercepting steam traps, set according to the pressure carried, the condensation will return to the trap. When the trap is full it will trip and discharge either into a waste pipe and run off or into a drip tank or hot well, from which it can be pumped into the boiler. There are return steam traps which receive the returned condensation, and when full, trip, opening a valve which lets high pressure steam enter. This closes a valve on the return pipe and opens a check valve on the pipe to the boiler; when the pressure being equal, both above and below the water in the trap, the water drops by gravity into the boiler. The trap then closes the high pressure steam valve and continues to receive the returned condensation.

### HEATING NOTES.

J. LELAND WELLS, chairman of the Executive Cammittee of the Master Steam and Hot Water Fitters' Association of the United States, is in receipt of the following letter from D. M. Nesbit, written from London, August 13: "It gives me great pleasure to acknowledge your letter of July 20, which conveys to me the news that the Master Steam and Hot Water Fitters' Association of the United States have thought fit to elect me an bonorary member (the first honorary member, I believe,) of your association. Words fail me to express in adequate terms my appreciation of the great honors your body has conferred on me. My visit to the States this summer, the making of so many dear and kind friends on the other side of the Atlan tic, coupled with the distinction I have alluded to, will be ever fresh in my memory, and, as I stated at the convention, a 'red letter day in my csreer as a heating and ventilating engineer.' Please convey to the association my best thanks for the distinction conboller side of the check is not the same as it is on the radistor side? The differ-ferred upon me, and I shall always be

glad to render what service I can to your association."

JAMES K. PEACOCK, one of the tcurists of the J. II. McClain Company, Canton, Ohio, is entertaining the plumbers and steam fitters who call at 69 Centre street. the New York office, while Manager D. R. McCallum is taking a vacation with his family in Canada. The factory is running overtime, turning out steam, hot water and hot air heating apparatus, and their line has been favoraby received by the trade near the New York effice.

THE New Haven Weekly Record reports that an addition will be built to the foundry of the Wm. II. Page Boiler Company, on Franklin street, Norwich. Conn.

T. C. Joy & Co., Titusville, Pa., are just issuing a circular of their Orient radiator that they are now making in all the usual hights, 24, 31, 39 and 45 inches. A table gives the dimensions and surface and instructions for ordering for steam and hot water. The popularity of the radiator made it necessary to manufacture the additional sizes.

LEBOSQUET BROS, Boston, Mass., manufacturers of steam and hot water heaters, have removed from 82 Union street to 89 the same street, which is almost directly opposite their former location. W. D. Hoisington, who has been connected with this concern for the past nine years, has succeeded W. F. Gilling as manager.

WE HAVE RECEIVED another scarlet bound pamphlet descriptive and illustrative of the Richmond steam and hot water heaters, which has been issued in the interest of E. H. Randall & Co., Concerd, N. H. A special feature of this publication are the final pages, which present views of residences in the special control of the second control of the secon Concord and vicinity which have been heated by the Richmond boilers. A list of references and testimonial letters trom that neighborhood is also presented.

UNITED STATES HEATER COMPANY, 113 Randolph street, Detroit, Mich., distribute an exceptionally neat little pamphlet entitled "When Folks Are at Home." That is the outside inscription, and within the four pages continue the story by saying that their rooms are kept comfortable and healthful by hot water heaters. The advantages of this style of warming are dwelt upon briefly, and particularly is attention given to church warming. At the close the United States Heater Company say that they will be glad to send book of special information on this tople.

PENN ENGINEERING COMPANY, 312 Cherry street, Philadelphia, issue an illustrated circular and price-list relating to Hanna's ball joint pipe hanger of their manufacture. The hanger is made entirely of malleable iron and the different forms are illustrated in the there being three different circular. styles made in 12 sizes from 1 inch to 6 inches. Accompanying the circular is a fac-simile of a letter written to the Penn Engineering Company by William J. Baldwin of this city, the well-known heating expert, in which he expresses his high appreciation of the hanger.

J. S. GLENN, proprietor of the Glenn valve manufactory, 115 Fremont street and 110 East Indiana street, Chicago, has just issued illustrated circulars calling attention to his special extra heavy globe valve and special extra heavy angle and check valve. This globe

valve is designed to meet the requirements of durability and tightness, and is, therefore, adapted to hard service. It is made entirely of brass or bronze, except the handle, and from 4 inch to 4 inches, inclusive. The thickness of metal in body, diaphragm and seat of the 1 inch valve is 1 inch The thickness of metal outside of pipe connection is \$ inch. Larger sizes are correspondingly heavier. The disk or valve is made \(\frac{1}{2}\) inch larger in diameter than the opening in the seat. It is east solid with the stem, which has four threads to the inch to allow quick opening and to the inch, to allow quick opening and closing. The handle has four lugs, exclosing. The handle has four lugs, extending downward toward the valve, to allow the use of a lever in tightening or loosening it, the atem being made strong enough to stand the leverage. The thread where the cap or bonnet screws in the body of the valve has eight threads to the inch, the coarseness of the thread being adopted to secure greater strength, and also to make it impossible for threads to cross when starting to screw on. The same features apply to the angle and check valve.

AT ONE OF THE PREVIOUS MEETINGS held to consider the formation of a so-

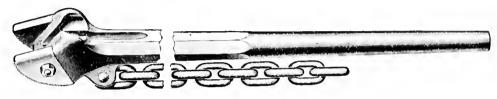

the company are W. L. Shephard, Chas. W. Hills, P. S. Barnes, John W. Crane, George V. Brickley, A. H. Matatall and Morton Belden. The officers are as follows: President, Chas. W. Hills: vice president and general manager, P. S. Barnes; secretary and treasurer, Morton Belden.

Among the prominent steam fitters who have recently called at the Chicago office of the American Boiler Company can be mentioned the following: Dunning Bros., Menominee, Mich., and W. W. Murphy, Peoria, Mich.

#### Trimo Giant Pipe Wrench.

The accompanying cut represents a wrench put on the market by the Trimont Mfg. Company, Roxbury, Mass. The wrench is described as having a solid forged head, with detachable interchangeable gripping jawa made from a fine quality of tool steel, and the chain used as being the best quality of cable chain. It is explained that the head is made so that the chain is held securely, without danger of fall-

capacity of from 400 to 500 horse-power. All of the waste steam is used in drying the product of the company, the exhanst being circulated through large coils and air is driven through these coils and into the dry ovens. In the manufacture of Indurated Fiber Ware hydraulic pressure is largely used, and to generate this pressure the company have a Worthington steam pump of a capacity of 1,000,000 gallons daily. In addition to this they have two smaller power pumps of a capacity of 250,000 gallons. The hydraulic pressure is kept up to from 150 to 200 pounds. The plant throughout is of what is known as "mill construction" and the apparatus for protection against fire is most complete and will be of interest. In addition to the water supply referred to above, an auxiliary pump, which is used exclusively for fire protection, is stationed in the engine room. This pump has a capacity of 800,000 gallons and connects not only with the city water mains, which at this point give a pressure of 125 pounds, but may also be readily connected with two tanks for auxiliary fire protection, holding 100,000 gallons. The entire plant is sprinkled, the equipment comprising something like 2000 sprinklers. Scat-

Trimo Giant Pipe Wrench.

ciety of heating and ventilating engineers, a committee on organization was selected, composed of Fred Smith, A. Carey, James A. Harding, W. M. Carey, James A. Harding, W. M. Mackay and Hugh J. Barron. This committee was instructed to consider and report some method of grading membership, as well as other matters pertaining to the establishment of an association of such engineers. The object has been considered a worthy one, and the committee have taken such steps that a meeting will be called for September 10 to effect a permanent organization of the Society of Heating and Ventilating Engineers. Men following this profession throughout the United States will be present, as the desirability of such a society has been generally conceded, and a lively interest taken in its formation which is intended to be on a high plane, worthy of such an important branch of work.

The Dugan Bros Plumbing & Heating Company of Salem, Ore., have recently completed what is claimed to be the largest hot water heating plant in the Northwest. It was installed in the Oregon State Reform School, and has been turned over to the trustees who have made their inspection and accepted it. Two horizontal steel boilers, made by the Kewanee Boiler Company, Kewanee, Ill., which feed an 8-inch flow main, and at 120° it is reported that a perfect circulation is secured; radiators at a distance of 270 feet from the boilers showing little difference in temperature from those located nearer.

THE NEW JOINT STOCK COMPANY in Elmwood, Conn., which has been incorporated recently, is called the American House Heater Company, and has a capital atock of \$100,000. The company's factory will be erected just south of the factory of the Whitlock Coil Pipe Company. The directors of

ing out; and that it still can be readily released at the will of the operator. The tool is designed for all kinds of work as well as hard and rough usage, and with its use the makers claim that there is no alipping, no locking and no lost motion. The wrench is made in six sizes, to take pipe from 4 inch to 16 inches, with handles from 27 inches to 84 inches in length.

### The United Indurated Fiber Company's New Works.

Our readers will remember that in July, 1893, the plant of the United Indurated Fiber Company of Lock-port, N. Y., was completely de-stroyed by fire. Immediately after the fire a new location covering some 14 acres was purchased, adjoining the old plant, and the work of rebuilding was immediately gotten under way, plans being laid for a plant which should be sufficient for the growing demands for Indurated Fiber Ware. The buildings are entirely built of stone, and, with the exception of two of the 13 buildings, are all one-story, and are so arranged that the product is passed from one to the other as it goes through the different processes, thus reducing the hand-ling to a minimum. Each department or process is in a different building, and the buildings are so arranged that with any possible increase of demand extensions can be made in each department. The company utilize in their pulp mill about 1000 horse-power, which they derive from the overflow of the Eric Canal at this point and which is known as the 18-Mile Creek. In addition to this water power the company have a steam plant, comprising a Corliss engine, 250 horse power; one Poppet valve engine. 175 horse power ; one Armington & Sims, 75 horse-power, for the electric light plant, and two smaller engines of 50 horse-power. The company's boiler plant is of a

tered around the works are ten outdoor hydrants, each fitted with a length of hose, and the company have a hose cart and extra hose on the grounds. Located in different points throughout the building there are 24 indoor hydrants with hose attached. The buildings cover in the neighborhood of 5 acres of ground. The company employ from 250 to 300 hands and turn out 1000 dozen articles of the various shapes and sizes mannfactured in their ware per day. The description of this extensive plant will be of interest as showing the developments of this line of mannfacture, which promises much for the future. The new line of goods to which the attention of the trade has been lately called — namely. Wash Basins and similar goods—will, it is believed, have a decided effect upon the trade in these lines. In spite of the depression of the last year the company report that they have been able to keep the works running full since they started in January last, and in some of their lines there has been a decided increase in the demand, while there has been no falling off in the demand for their staple goods. The officers of the company are Jesse Peterson, president; Heury G. Cordley, secretary: James E. Hayes, treasurer: Charles E. Folger, assistant treasurer: Cordley & Hayes of 172 Duane street, New York, represent the line in the East; the Indurated Fiber Ware Company of 55 Wabash avenue, Chicago, representing the company in the West.

The new Southern Railway Company, who on August 1 commenced business as successors to the Richmond & Danville and East Tennessee, Virginia & Georgia railways and their allied lines, will operate in all some 7000 miles of roads. Starting under strong and able management the new system promises to be of great advantage to the people of the South.

# TIN PLATES.

### The Ups and Downs of Tin Plates.

Under the above title the Bulletin of the American Iron and Steel Association gives the following interesting particulars in regard to the fluctuations in the tin plate tariff of the United States

during the last 50 years:

Prior to the civil war the duty on tin plates, whether they were specially named or not, was always a low ad valorem rate, for revenue only. Rob ert J. Walker's tariff of 1846 made the duty 15 per cent. This was the highest rate that had previously been imposed. Tin plates were not then made in this country. In the James Guthrie revenue tariff of 1857 the duty on tin plates was reduced to 8 per cent. The revenue duty of 15 per cent., existing from 1846 to 1857, had entirely failed to develop a tin plate industry of any di-mensions whatever, and of course the lower duty of 8 per cent. could not ac-complish what a higher rate had failed to do.

In the first of the so called war tariffs, the Morrill tariff of March 2, 1861, the tin plate duty of 8 per cent. was increased to 10 per cent., revenue only being still contemplated. The tariff of July 14, 1862, still further increased the

duty on tin plates to 25 per cent.

It has been contended that by various tariff acts during the war period, culminating with the act of June 30, 1864, it was the intention of Congress to impose a specific duty on tin plates of, first, 2 and then 21 cents per pound, and that this intention was frustrated by a decision of Secretary Fesaenden, dated July 22, 1864, who ruled that it was the intention of Congress to make tin plates subject to a duty of only 25

per cent.

The duty on tin plates, as interpreted by Secretary Fessenden, continued to be 25 per cent. until 1872, when it was reduced in the Dawes bill to 15 per cent. In 1875 the duty was made specific at 1.1 cents per pound, and in 1883 this duty was reduced to 1 cent. per pound, which rate remained in force until the passage of the McKinley tariff of 1890, when it was increased to 2.2 cents per pound, to take effect July 1, 1891. The new tariff reduces the duty to 1.2 cents per pound, to take effect October 1, 1894.

The McKinley tariff imposed a duty of 4 cents per pound on block tin; the new tariff puts block tin in the free list. We observe that foreign dealers have just put up the price of block tin, so that the repeal of the duty may not benefit our manufacturers.

We owe the rate of duty on tin plates in the McKinley tariff—namely, 2.2 cents per pound—to a suggestion of the Tariff Commission of 1882. This is the rate recommended by the commission, but the Republican Congress of that day had not the courage to accept it, but in the tariff act of 1883 it actually reduced the previous rate of 1.1 cents per pound to 1 cent per pound. The New York Tribune opposed the increase recommended by the Tarlff Commisaio n.

The new tariff will make the dipping of tin plates in this country from imof the places in this country from imported black plates exceedingly difficult. On cold rolled, smoothed, pickled, and cleaned sheets of 25 gauge and less the duty provided is 1.1 cents per pound plus + cent, or 1.221 cents in all; between 20 and 25 wire gauge the duty is 0.921 cent per pound. these rates will operate as a check upon the importation of black plates for tinning purposes they ought to correspondingly atimulate the production of domestic black plates.

The new tariff bears very heavily upon our galvanized sheet industry. It provides a duty on galvanized sheets of } cent per pound additional to that imposed on black sheets, whereas the McKinley tariff provided an additional

duty of 4 cent per pound.

### Record Mfg. Company's Annual Picnic.

The first annual picnic of the employees of the Record Mfg. Company, Conneaut, Ohio, on Wednesday, August 22, was the occasion of a very pleasant display of the sympathy and good feeling which exist between the firm and their work people. Over 400 guests were conveyed to the exposition grounds at Conneaut Lake, where a substantial repast was provided for them, after which boating, dancing, racing and various forms of amusement were en-

joyed to the fullest extent.

In the course of the afternoon the guests gathered in the auditorium to listen to an address of welcome and friendly counsel by Mr. Record to his "family," as he happily termed his employees, in which he assured them of the fatherly interest and regard in which he held each member. Speaking of his ideal of the relations of employers and employed, Mr. Record said he believed one of the best things that can be done is a meeting such as that they were then enjoying, where, by association, they could come into friendly touch with one another and learn to under-stand and appreciate one another's char-acters and conditions. "I believe," acters and conditions. "I believe," said he, "there are ofttimes too high barriers between the employer and employees, and each is too apt to look at his own side of the question regardless of the other, and thus create almost insurmountable antagonisms, when in fact they are indispensable to each other. Each has rights of his own, but their welfare is identical and should be harmonized.'

Speaking, further, of his own relations with his work people, Mr. Record remarked as follows: "It has always heen my aim to look to the welfare of those in my employ, and I have often, in my own mind, placed myself in their positions and then asked the question what I would desire if I were thus situated. It has also been my desire to atimulate those in my employ to personal advancement by increasing their facilities. Their advancement is always based on competency, ability and will-inguess of application. Those who have heen owners of large factories know

well the struggle the employer has had to contend with. It is customary with a great many, when competition is sharp and cuts off the profits, to largely reduce the cost of labor; but it has been my rule in such cases to devise appliances that I could place in the hands of my employees to render their labor more effective and more productive, and thus overcome the obstacles without reducing the wages of any. It has ofttimes seemed dark and foreboding, but Providence has given me so far an insight into mechanical science as to enable me to pursue this course."

The address was warmly received by

the auditors, and was followed by a very gratifying expression of the esteem in which Mr. Record is held by his em-ployees, in the presentation to him of an elegant chair in commemoration of his fifty-fifth birthday. It is intended that the "Record picnic" shall be a

regular annual event.

### SCRAP.

WE ARE ADVISED that "Merry's Old Method" roofing plates, to the extent of several hundred boxes, were selected in an open competition for the new "Cosmopolitan" Library, now being completed at Irvington-on-Hudson. The "Cosmopolitan" Library, on which no expense has been spared, will be one of the finest publishing houses in the country, and the selection of their special broad of themse with the selection of their special broad of themse with the selection of their special broad of themse with the selection of their special broad of themse with the selection of their special broad of themse with the selection of their special broad of themse with the selection of their special broad of themse with the selection of their special broad of themse with the selection of the s cial brand of terne plate for this building is highly gratifying to Merry & Clark, 535-547 West Fifteenth street, New York, the sole importers and owners of this well-known roofing plate.

THE QUESTION of what will be the future policy of the existing American tin plate works under the new tariff conditions is one which has been much canvassed in the trade. To inform their customers on this head, so far as regards their own works the American Tin their own works, the American Tin Plate Company of Elwood, Ind., one of the largest and most successful concerns in the business, have issued a circular letter under date of August 21 in the

following terms:

"We have received quite a number of letters from our customers asking whether, after the duty is changed on tin plate, they can still depend on our operating our mill and getting a supply from us. In reply would state that we are in the business to stay, and that we shall run full capacity right along, regardless of change in tariff, and propose to meet all legitimate competition, both foreign and American, quality con-sidered. Our present canacity is nine sheet mills and product 6000 to 7000 boxes per week."

THE MONONOAHELA TIN PLATE COM-PANY of Pittsburgh have been granted a charter of incorporation, with a capital stock of \$5000. The incorporatora are H. W. Mitchel, Wm. Montgomery, of Pittsburgh, Wm. A. Dodge and Chas. F. Palmer of Allegheny, Pa.

UNDETERRED by the prospective alterations in tin plate conditions, on account of the new tariff law, Meurer

Bros. Company, 575-577 Flushing avenue, Brooklyn, continue to run their tin plate works full time with all six tinning pots and intend doing so in-definitely. The firm have a large and steady demand for their guaranteed roofing plates and are of the opinion that they will be able to make these plates and dispose of them with profit, even under the adverse conditions which have forced the smaller dipping establishments to close down. contemplate, and are making preparations for, the installment of four additional tinning machines and other tin plate machinery, including a steam pickler, with the view of largely in-creasing their output. Messrs. Meurer report an excellent business during the past month in all the lines of sheet iron and metals which they handle, August's sales being 40 per cent, larger than those of any previous month in the past

PHILADELPHIA ADVICES indicate that the tin plate manufacturers in that city generally are not alarmed at the situa-tion at all. They say the demand for high grade American plates is so thoroughly established that they can hold the trade against foreign competition. Prices of black plates must come down to meet the emergency, and so must labor, and with such adjustments as will doubtless be made they profess to have no fears of the ultimate outcome.

Among the tin plate manufacturing establishments in this vicinity which have closed down owing to the new Tariff are those of A. A. Thomson & Co., Kahn Bros. and George W. Jaques in New York City, and Sanders, Fielding & Bond in Jersey City.

A NEW BRAND of American roofing terne, named "Cort's Old Style," has just been placed on the market by Mortimer H. Cort, 9 Burling slip, New York City, for whom it is exclusively manufactured. The plate, as its name indicates, is an old style, heavily coated terne, and is claimed to carry 30 pounds of coating to the box of IC, 20 x 28. It is specially recommended for those requiring a high-grade roofing plate.

THE TIN PLATE WORKS of Merchant & Co., Incorporated, of Philadelphia are reported to be running full, night and day, to fill orders for the firm's special brands of roofing plates, for which the demand is wide and growing. Messrs. Merchant's New York and Brooklyn sgencies advise us that these roofing plates are gaining great head-way in this vicinity, Merchant's Roof-ing being specially in request for the better class of buildings in New York State and New England. The firm's tln plate works will continue in active operation despite the change in tariff, special attention being devoted to their guaranteed brands of terne-namely, Merchant's Old Method, Merchant's Roofing, Alaska and Special Extra

THE AMERICAN TIN PLATE MACRINE & Mfg. Company, Linfield, Pa., have just added a second Buckman tinning machine to their plant, by means of which their output of continuous roofing tin will be doubled, giving a capacity of about 20 tons a day. Mr. Buckman, the inventor of the machine, who is superintendent of the Linfield Works, expects to have the new machinery in running order next week.

THERE has been a talk among the trade this week of a decision by the directors of the Duquesne Tin Plate Works, Pittsburgh, Pa., to expend a large sum of money-\$150,000 was mentioned-in immediate work in extencions to their plant.

MERCHANT & Co., Incorporated, Philadelphia, issue an attractive circular relating to their Continuous Roofing Tin, which is sold under the name of Tandem. The name of the tin is put to good use in the illustration that heads the card, it being a two-wheeled vehicle loaded with a roll of this tin and drawn by two horses driven tandem by a brownie. The advantages of this style of roofing are alluded to in the text.

THE NEW TINNING DEPARTMENT Of the Ætua-Standard Iron & Steel Company, Bridgeport, Ohio, has been in full and successful operation for two months, coating some 300 boxes of plates per day. At present only coke plates are made, namely, "Etna" bright tin and "Belmont" terne. The product is said to be highly thought of by those who have used it, and the firm have received some very flattering letters in relation to it from their customers. The black plates used are rolled in their own mill.

### European Drainage Systems.

An interesting summary, says the London Plumber and Decorator, is given by a French contemporary of those Continental towns which apply the sewage effluent for agricultural purposes on a more or less extensive scale, from which it appears that the practice is not quite so modern an invention as some might suppose. For instance, in Italy the towns of Florence, Novara and Milan have made use of this auxiliary in husbandry for centuries. While in China, fount of ancient science, the value for husbandry of human ordure has been recognized for ages. More modern examples are sfforded by Switzerland, where Fribourg and Lausanne, and Belgium, where the capital, Brussels, are adherents of the water borne and sewage farm system. The modern development of the drainage net-work of Berlin, combined with ag-ricultural treatment, is one of the most extensive and complete. The German capital is divided into 12 basins, each served by an elevating machine which raises the sewage to the hight necessary to divert it by gravitation to the respective sewage farm areas, situated from 8 to 10 miles from the town.

At Danizig also the sewage is made use of in agriculture, instead of being

discharged into the sea.

Other German towns and places utilizing sewage in agriculture are Frank-Munich, the whole of the province of Wurtemberg and the asylums at Dalldorf, near Berlin, Marburg (Hesse), Verneck, Nietleben, near Halle (Sax-ony), Langerich (Westphalia), Osna-bruck in Hanover and Königsluther in Brunswick.

In Hungary the capital, Pesth, utilizes its sewage agriculturally.

In Russia, Odessa does the like.
In Spain, Valentia and Madrid follow suit; and in classical Grecce, the capital, Athens, is an adherent of the

In France, as elsewhere, many towns, in a certain kind of way, are adherents of the agricultural treatment of sewage, in teeming the contents of their water closets into the streams which pass through the towns, which themselves eventually fertilize the neighboring fields; this is the case, more or less artificially, in most of the towns of Normandy, Dreux, Chartres, &c. But of his own work.

St. Etienne and Perpignan carry out an artificially arranged scheme in diverting both their liquid and solid sewage to agricultural purposes. It is also so at Montélimer, where the right to utilize the sewage has been granted to a joint stock company of land owners, treating 70 acres of land. Rheims, after exhaustive experiments, has given up the idea of purifying the sewer water by chemical processes, and is resorting to purlfication by earth. right to utilize the sewage has been conceded to a company, and 375 acres are to be treated. The towns of Cannes, Nice and Havre are following suit with the preliminary works. In 1886, following the report of Dr. Brouardy and Engineer Bonnegall, the municipal authorities of Toulon decided to establish a network of ventilated sewcrage, capable of receiving all the sewage of the town and to transport it to the southwest side, to be employed there in agricult-At Poitiers the town council have just decided to construct a network of sewers answering to all requirements, and 150 acres of land have been set apart as a sewage farm.

At Versailles the system is in partial employ, and it is also used at the following institutions: School at Vallepreux, the madhouse at Vaucluse, the hospices of Saint Brice at Chartres, &c. Lille, Mézières, Lorient use no other manure than sewage in their neighborhoods, while Lyons and Bordcaux devote a portion of their sewage to this purpose. Judged by its numerous adherents, the utilization of sewage for agriculture seems to have vidicated its

expediency.

New York wool importers are preparing to make their city the great wool center of the country, now that free wool is in sight. With this end in view the New York Woo! Warehouse Company are beginning the construction of a big building, at West Broad-way and Beach street, for the housing of wool, a wool exchange, a wool bank, and a wool club. The New York Wool Exchange is now being organized, as well as the New York Wool Club, both of which will soon be in operation. The new building, which will be a handsome structure of 11 stories, is expected to be ready for use by next February.

The statement of the "Sault" Canal for the past year, recently issued, shows that the business of this season has been 5,096,033 tons, being 17,000 tons less than that of last year. In July the total freight tonnage was 1,637,618, against 2,017,000 tons in July of the previous year, the latter having been the heaviest month's business known in the history of the canal. The greatest increase this year has been in ore, of which 3,077,000 tons have been carried, as compared with 1,928,000 tons last year, while the main decrease is shown in coal and wheat, which have fallen off 60 and 50 per cent, respectively. Lumber to the extent of 326,000,000 feet has passed this sesson, being 77,000,000 feet more than the figures of last year.

B. Petropavlosky, one of the engineers in charge of the construction of the great trans-Siberian railroad, has arrived in San Francisco on his way to Russia to report on the progress of that undertaking. He will examine the railroad systems of the United States and Europe on the way, in order to gain useful information for the benefit

## PLUMBING and GAS FITTING.

### Union County, N.J., Plumbers to Organize.

State Vice-President John Hickman of New Jersey is sending the following letter to the plumbers of Union County with a view to forming a master plumbers' association:

We have for some time past seen the necessity for the organization of our craft in this State, in order to give us the protection that other organized cities receive, and also to bring our trade together in closer bonds of good fellowship and harmony. To accomplish this end we need the co operation of every master plumber in this county.

We have accordingly set apart the evening of September 5 for a meeting at Young Men's Association Hall, situated on Rahway avenue, Elizabeth, at 8 p.m., of the plumbers of Union County, N. J. There will be several speakers, including President John Mitchell of the National Association of Maater Plumbers, Henry G. Gabay and Samuel Malcolm of New York, and Alexander Don of Newark.

We have taken the liberty of using the following gentlemen as committees, and trust they will use their endeavors and influence to bring all the craft: J. S. Whelan, James II. Faulks, Elizabeth; W. B. McNamara, John Carney, David T. Kenney, Plainfield; Geo. Tobin, L. S. Hughes, Summit; S. K. Tombs, Rahway.

We also extend an invitation to the

Board of Health to be present.

We trust you will be on hand in good season on the evening named.

### New York Plumbers' Clam

The Master Plumbers' Association of New York City held its annual clam bake on Thursday, August 23, at Rye Beach, 24 miles from New York City, on the line of the N. Y., N. H. & H. R. R. At nine o'clock eighty master plumbers and their friends met at the Grand Central Station, and one hour and a half afterwards arrived at Beek's Hotel. The genial proprietor had breakfast ready for the guests. The clambake was served at three o'clock.

After breakfast Jos. W. O'Brien and John Yule picked out their nines for a game of baseball. The O'Brien nine accred 18 and the Yule men only made 14 runs. Later a football was kept in motion, the most active "kicker" being John Yule.

A rifle contest was held, the scores being Jno. Renehan and C. H. Cranich-felt, 18; H. J. Pattison, C. S. McKeon and S. G. Collins, 16; Col. Geo. D. Scott, 14; J. F. Corcoran and W. Emmet Crosby, 13; F. Callahan and T. J. McCormack, 12. Sultable prizes were awarded, Executive Clerk Crosby receiving a "nigger" doll baby.

The following are a few of those present: John Mitchell, president National Association; II. J. Pattison, acc retary National Association; II. G. Gabay, John Byrns, Wm. Montgomery, Jos. W. O'Brien, Geo. Krindall, C. Hopker of the Delamater Iron Works,

Jno. Renehan, Geo. B. Brown, I. O. Shumway, Jas. O'Brien, Fidel Ehr-Shumway, Jas. O'Brien, Fidel Ehrhart, Henry Steeger, Geo. Stoltz, J. McCann, Chas. A. Welch, Geo. H. Dunn, F. Flannagan, W. Emmet Crosby, National Executive Clerk; Jno. McCarron, Chas. Schloesser, Paul Euell, John Yule, J. G. Collins, Milton Schnaier, C. Harrison, Col. Geo. D. Scott, Chief Inspector of Plumbing; Louis A. Hornum, Second Deputy Superintendent of Buildings: Francis Callaging. Louis A. Hornum, Second Deputy Super-intendent of Buildings; Francis Calla-han, W Kirchhoff, A. Meixel, C. H. Cranichfelt, Wm. T. McGrady, Jno. Quinn, C. S. McKeon, J. F. Corcoran, P. J. Carpenter, T. J. Mooney, T. F. McCall, I. J. Brown, J. Wright, David McElraeyy, Mr. Tenant of the Health Department; Capt. Ar-noid. Geo. Hackett. Sewer Permit noid, Geo. Hackett, Sewer Permit Clerk; Jas. Neugent, T. J. Toumey, Alex. Bryant, Wm. Lockwood, Clerk of the New York Association; Edw. Murphy, H. M. Bristol, Jas. Gribble, of Dimmock & Fink; Mr. Stewart of The Stewart Ceramic Company; T. Mc-Cormack, Wm. McShane, John A. Murray, manager Henry McShane Manufacturing Company; M. J. McDermott, Jno. Fyfe.

#### TRAPS AND VENTS.

ROBERT WATT, plumber, of Philadelphia, is to erect a four story establishment for his business.

CHARLES P. F. CUSHING is a Tabascoite who represents the Kennedy Valve Mig. Company, 52 and 54 Cliff street, New York. The line of valves are made for steam, water and gas in brass and iron, the brass goods being used in large quantities by the Government. The latest hose hydrant of the house is set up so that the upper part is shown on the sample floor and the lower end already for a water connection is shown in the basement. A new movable disk check valve is one of their latest productions. A specialty is made of sup-plying valves for exceptional require-ments in addition to a large line of unusual but very convenient goods. Their latest high pressure valve, made to stand 300 pounds, is a neat looking

A MAN who has done the plumbing in a new house which he built at Huntington, Ind., is having some trouble to get the water turned on. This, it appears, is the second time he has done the same thing, getting what assistance he needed from an out of town plumber, who, having no license, could not comwith the local ordinances. The local plumbers refuse to come in and inspect the work and assume the responsibility of having the water legally turned on without a fee of \$16, which

THE COLWELL LEAD COMPANY, 63 Centre street, New York, leave none of the demands of the plumber unsatisfied. Lead pipe and sheet lead made on the apot and water closets, brass goods and baths are ready for prompt shipment from their warehouses. They are just sending out circulars of the Helper

fire pot, which is so made that it heats a pot of solder or a pair of coppera, and on removing the hood the flexible burner can be used as a torch to wipe a joint, seam or melt old connections.

AT A RECENT MEETING of the Board of Health of Lynn, Mass., eight master plumbers and 20 journeymen were registered and sworn in under the new

WM. CAMPBELL, formerly with Eston, Cole & Burnham, has opened a plumbers and steamfitters' supply house at 315 West 125th street, New York. He will also do a pipe fitting business and is now installing two Perfeet hot water heaters in the houses of H. McQuade.

LEAD THIEVES were never more numerous than they are now, says a Buffalo, N. Y., daily. Reports of thefts of lend pipe come in daily to the police, and they have been endeavoring to round up the gang of thieves who are pestering the contractors erecting new houses in various parts of the city.

WALTER H. McLAIN & Co., Massillon, Ohio, have purchased the stock of plumbers' material of Capt. S. M. Kuapp and have gone into business in the latter's North Erie street building. They expect to take contracts for all classes of sanitary work, steam and gas fitting.

AT THEIR SESSION at Peoria, Ill., last week, the master plumbers of Illinois drafted a bill to be presented to the next general assembly. In a general way it requires a registration of all plumbers, both masters and journeymen, and ordinances for cities of over 5000 population.

JOHN LEWIS has moved his plumbing shop from under the post office, at Alli-ance, Ohio, to the west room of the A. W. Coates Rake Works.

PARK & McKAY COMPANY, Detroit, Mich., issue catalogues of the Tabasco front outlet water closet. A new catalogue of this concern, which is in the printer's hands, will be ready for distribution September 1. The circulars alluded to show the Tabasco closet in six different styles. The illustrations are finely executed, showing all the features of the apparatus, while particulars are given of its construction. lars are given of its construction and finish. All of the closets are provided with adjustable nickel plated hinged seats.

THE SECRETARY OF STATE of South Carolina has granted a commission to the "Charleston Plumbing Company," which proposes to do a general plumbing and tinning business and to buy and sell hardware, at Charleston, S. C. The sell hardware, at Charleston, S. C. The incorporators are J. C. Baerd, R. T. Baerd and H. A. Halervenue. The capital stock is to be \$5000, divided into 100 shares of \$50 each.

THE FOLDING BATH TUB COMPANY, Marshall, Mich., distribute illustrated circulars relating to the folding bath tub of their manufacture, which they refer to as the aeme of perfection. The latest pattern is a handsome article, and the illustration shows it closed, in which position it looks like a small wardrobe, while at the side the spparatus is open, showing the tub and the heating attachment.

JOHN D. INGALLS, who died last week in Cambridgeport, Mass., was an old and highly respected citizen of Cambridge. He was nearly 70 years of age, and for many years was engaged in the plumbing and pump manufacturing business, having his factory on Harvard street.

THE ALBERENE STOVE COMPANY, 393 Pearl street, New York, are beautifying their showroom by frescoing the walls and ceiling and later will make a fine show of plumbers' stoneware, sinks, laundry tubs, &c., when the work is completed.

THE PLUMBING FIRM OF Wardell & Garrabrant, Orange, N. J., have been dissolved by mutual consent and will be

Tuesday, 70 delegates being present. At noon the local association treated them to a clam bake. The proceedings were carried on in executive session.

SECRETARY CROWELL of the Master Plumbers' Association of Monmouth County, N. J., sends us the following as a correct list of their officers: President, Samuel McCloud, Long Branch; vice-president, Ferdinand Brown, Asbury Park; recording secretary, B. Crowell, Asbury Park; financial secretary, Wm. McMahon, Red Bank; treasurer, John Flitcroft, Ocean Grove.

Thos. Kelly & Bros, 124 Franklin street, Chicago, have been awarded a beautiful bronze medal by the Illinois Chapter of the American Institute of Architects in the first annual Chlcago building trades and material exhibition held in the Institute of Building Arts,

The Climax Oil Heater.

The Climax Mfg. Company, 25 Lake street, Chicago, have brought out an oil heating stove which has decidedly novel Illustrations are herewith features. given which will enable theseto be fully understood. In appearance the heater resembles a radiator. This form has been adopted to secure the maximum of radiating surface. A 4-inch burner is placed in each of the four columns, all taking their supply of oil from the east iron reservoir which forms the base. The reservoir being of cast iron, there is no leakage. The long radiating flues make perfect combustion and prevent odor. An ornamental cast iron top covers the whole of the stove. It has a swing cover, as shown in Fig. 1, which can easily be removed, disclosing two

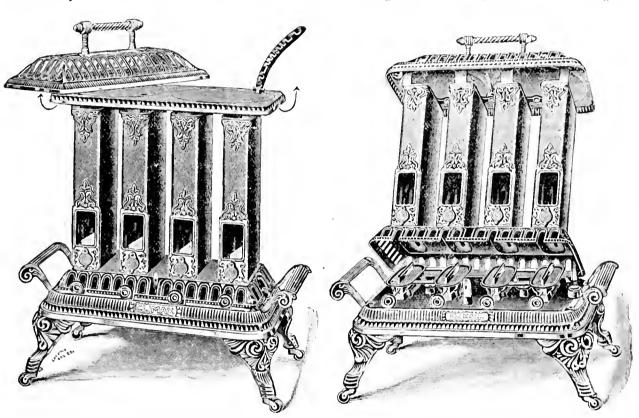

Fig. 1.-The Climax Oil Heater.

Fig. 2.-Climax Heater with Burners Exposed.

succeed by C. Garrabrant & Son, at the old Stand at 19 Stetson street.

A PLUMBER in want of any of the plumbing fixtures that belong to beer pump work, or hints about doing the work, will find the goods and information at the factory of Samuel S. Toombs, 10 Peck Slip, New York.

THE BOARD OF PLUMBING INSPECTION OF YORKERS, N. Y., at a meeting on Thursday night considered a large number of applications from plumbers of New York City and other places. The charter of the city provides that non-resident plumbers cannot work in Yonkers without a license.

Winslow & Meredith, Bennington, Vt., the plumbers, have dissolved partnership, Mr. Winslow buying Mr. Meredith's interest in the business. Mr. Winslow will probably continue the business at the old stand. Mr. Meredith will start in the business again alone.

THE CONVENTION of the Massachusetts Master Plumbers' Association opened in Music Hall, at Fall River, on

Msy 15 to June 2, 1894, for their exhibit of siphon and washout closets and siphon overflow sanitary washbasins.

From the A. Y. McDonald Company, Chicago, we receive circulars of the Eureka seat and the Jetties siphon closet. The Eureka seat is separate from the closet and is supported by an ingenicus device, either from the floor or the wall, leaving an open space behind for cleanliness, and permits the necessary pipe to be run without interference or fitting. The picture of the Jetties shows a very pretty embossed closet, with a round cornered flush tank and independent seat. The closet is of the siphon construction, of which they say: "We have endeavored to put on the market a good closet at a reasonable price, and we think we have succeeded."

A BOND AND APPLICATION for a plumber's license was presented to the Board of Water Works Trustees, at Huntingdon, Ind., by Frank McCsuley. The bond was approved and a license granted.

cooking holes. Fig. 2 shows the upper portion of the stove tilted over for the purpose of trimming wicks. It also shows how the top is arrsnged over the radiating flues. A leading feature of this stove is the fact that one, two, three or all the burners can be used according to the heat required. The radiating flues are made of Russia iron. All exposed iron parts are nickeled. It is mounted on casters, so that it can be easily moved about. The capacity of the reservoir is 1 gallon, which will supply the burners for ten hours. The hight of the heater is  $25\frac{1}{2}$  inches and the weight is 40 pounds. The manufacturers state that its hesting capacity has been thoroughly tested and they offer it with confidence to those who are seeking a powerful oil heater.

GULLATT & WELLS are a new firm at Atlanta, Ga., who will do a general plumbing business at 40 North Broad street. Mr. Gullatt was junior partner of Paul & Gullatt. Mr. Wells was bookkeeper for the same firm for over eight years.

## ROOFING AND CORNICE.

### The Country Cornice Shop.

XI.

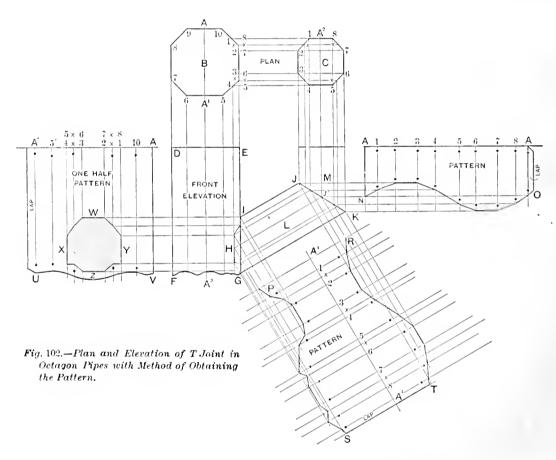

BY CORNICE WORKER.

#### Patterns for I Joints in Octagon Pipes.

In Fig. 102 is shown the plan and elevation of a I joint, also the method of obtaining the patterns, the section of the pipe being octagon. Let D E F G L M, Fig. 102, represent the front elevation of the I joint in question, at any given angle, B in plan view, the profile of the larger pipe, and C in plan view,

pipe C, plan view Fig. 102, as before explained it will be necessary to obtain this seam line in elevation so as to obtain the line of the seam on the elbow patterns. To do so and also to obtain the intersection of the smaller pipe against the larger pipe in elevation proceed as follows: From the intersections of the smaller pipe against the larger pipe in plan, Fig. 102, drop lines parallel to A A<sup>3</sup>, as shown. Now parallel to A A<sup>3</sup> drop lines from the intersections and small figures, including the seam line on the smaller profile C in plan until the lines intersect the miter

tern. It will also be noticed that A A of the stretchout represents the seam A<sup>2</sup> of the profile C and that the seam line intersects the miter line J K at J<sup>1</sup>, and the intersection of the larger plpe in elevation at H, all as shown in Fig. 102. Now at right angles to A A draw lines indefinitely, as shown, which intersect with lines of corresponding numbers drawn at right angles to A A<sup>3</sup>, or parallel to the stretchout line A A from the miter line J K. Short lines connecting the points of intersection, as shown by N O, will be the required pattern for that part of elbow indicated at M in the

THE COUNTRY CORNICE SHOP .- PATTERNS FOR T JOINT IN OCTAGON PIPES.

the profile of the smaller pipe. Care should be taken to draw the plan and elevation in their proper relation to each other. Let the seam in the larger pipe B be placed as shown at A, and let the seam in the amslier profile C be placed as shown at A², Fig. 102. Now at right angles to A A' draw lines from the corners of the profile C intersecting the profile B, as shown at 1 8, 2 7, 3 6 and 4 5, corresponding to the figures on the corners of the smaller profile C, shown in plan view Fig. 102. The next step is to obtain the intersections of the corners, X X and X X of the larger profile B, upon the smaller profile C. At right angles to A A' draw lines from the corners X X and X X, intersecting the smaller profile C on the four sides, as shown by X, X, X and X. As the seam is to be placed at A² in the smaller

line J K in elevation. Now parallel to the lines of the pipe J I or K G draw lines from the intersections on the miter line J K, intersecting lines drawn from corresponding figures on the profile B in plan view. A line traced through these intersections will be the miter line, showing the intersection of the smaller pipe with the larger pipe at the angle E I J as shown by I H G. To obtain the pattern for part of the elbow M shown on front elevation in Fig. 102 proceed as follows: At right angles to A A³ draw the line A A, upon which place the stretchout of the smaller profile C, as shown by the small figures A, 123, &c., on the line A A.

It will be noticed that we have not transferred the interactions x x and x on the profile C to the stretchout line  $\Lambda$  A, it not being necessary for this pat-

elevation. For the pattern of part of the elbow I, shown in elevation in Fig. 102, proceed as follows: At right angles to the lines of the pipe I J or G K draw the line  $A^4A^4$ , upon which place the stretchout of the smaller pipe C, as shown in plan, Fig. 102, being careful to transfer the intersections  $x \ x \ x$  and x to the stretchout  $A^4A^4$ , as shown. At right angles to  $A^4A^4$  draw lines indefinitely through the small figures which interacet with lines of corresponding numbers drawn at right angles to the lines of the pipe I J or K G from the miter line J K at the top and from the miter line I H G at the bottom.

A line traced through these intersections, as shown by PST and R, will be the required pattern for that portion of the elbow, shown at L, front elevation in Fig. 102. It will be noticed that

the lines x, x, x, x, drawn at right angles to the stretchout line A<sup>4</sup> A<sup>4</sup> in Fig. 102, have not been used in developing the pattern of the pipe for the miter line J K. it not being necessary, because the cut R T is the same as the cut N O on the pattern for the pipe M, but they have been used in developing the pattern for the lower part of the pipe L, intersecting with points drawn from the miter line I H G in Fig. 102, as shown in the cut P S in pattern. To obtain the size of the opening which will be cut in the larger pipe, D E F G, front elevation, Fig. 102, proceed as follows: At right angle to A A<sup>3</sup>, draw the stretchout line A A1, upon which place one-half of the stretchout of the pfofile B, commencing at the seam A, as shown by the small figures on the stretchout line A A<sup>1</sup>; the figures 5 4, x x, 6 3, 7 2, x x, and 8 1 corresponding to the numbers, showing the inter-

one, by means of a flaring collar or 'reducer." The following sketches have been prepared, showing how to obtain the patterns, whether the pipe be round, square, or octagon in plan. Let Fig. 103 represent the joining of a smaller pipe to a larger one, by means of a flaring collar, the pipe being round. A B D C represents the elevavation, E F the plan of the smaller pipe, and G II the plan of the larger pipe; I J the straight hight of the flare between the two pipes; the center flare between the two pipes; the center point of the large and small pipe being the same. Connect the pipes as shown by L K and N M, and produce these two lines until they intersect the center Then will O be the center point and O M and O N the radii with

which to strike the pattern.

Now, with O N, Fig. 103, as radius and O of Fig. 104 as center strike an arc, as shown by N A. Draw a line

draw in the bottom flange, shown at R D in Fig. 104, by running the flange through the turning machine, and then draw in the flange with the use of the mallet on the bottom stake. In Fig. 105 is shown the method used in joining a smaller pipe to a larger one, by means of a flaring collar, the pipe being rectangular in plan; also the method of obtaining the patterns. Let A B, 12, C D E F represent the front elevation, K L M N the plan view of the larger pipe, and G H I J the plan view of the smaller pipe. To obtain the patterns for the flaring collar, shown by E F, 12 on elevation, Fig. 105, proceed as follows: At right angles to E, 2 of the elevation draw the line O P indefinitely, upon which place the stretchout of the flare, or slant hight of the collar, shown by 12 or F E of the elevation. At right angles to O P draw lines through 1 and 2, as shown,

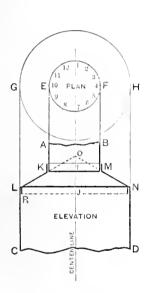

Fig. 103.—Joining a Small Round Pipe to a Larger One by Means of a Flaring Collar.

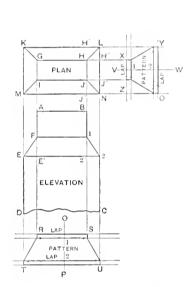

Fig. 105.—Joining a Small Rectangular Pipe to a Larger One by Means of a Flaring Collar; Also Method of Obtaining the Patterns.

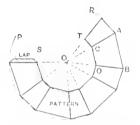

Fig. 107 -Pattern for the Flaring Coltar Shown in Fig. 106.

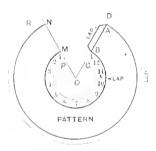

Fig. 104.—Obtaining the Pattern for Flaring Collar Shown in Fig. 103.

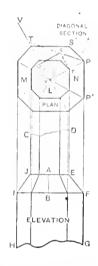

Fig. 108.—Joining a Small Octagon Pipe to a Larger One by Means of a Flaring Collar.

THE COUNTRY CORNICE SHOP.-FLARING COLLARS FOR ROUND, RECTANGULAR AND OCTAGON PIPES.

sections of the smaller pipe C against the larger pipe B in plan.

Now, at right angles to A A¹ drop lines from the stretchout line, which intersect with lines of corresponding numbers drawn at right angles to the lines of the pipe D F or E G, from the mlter line I H G. A line drawn through these intersections, as shown by W X Z Y, will be the opening required. Laps are allowed for riveting on the three patterns, as shown in Fig. 102. It will be noticed that A¹ A U V represents but one-half of the pattern of the larger pipe. For the entire pattern on the line A V, transferring the dots, as shown, which indicate the bends, and omitting the opening W X Z Y and the lap for riveting. This completes the entire patterns required. Laps should be allowed on the miter cuts of all elbow patterns shown in this figure.

### Flaring Collars for Round, Rectangular and Octagon Pipes,

It is often the case in putting up leader or other pipe work that a smaller pipe is connected to a larger from N to O, as shown; then with O M, Fig. 103, as radius and O of Fig. 104 as center strike another arc as shown from M to B. Divide the plan E F, Fig. 103, into an equal number of spaces, and measure off these spaces on the arc M B, Fig. 104, commencing on the line N O, as shown Draw a line from the from M to B. center point O through the point B, intersecting the arc A N, as shown at Allow a lap, as shown from A to Then will A B M N, Fig. 104, be the pattern for the flaring collar, shown by MNLK in Fig. 103. In joining the collar to the pipes flanges would be allowed for riveting, as shown at R and K in Fig. 103. It will be noticed that the flanges K and R are so arranged as to correspond to the flow of the water. To obtain the flanges R and K upon the pattern, add their widths, as shown at R D, in Fig. 104.

Now roll the pattern, shown in Fig. 104, on the blow horn stake, and rivet and solder same water tight. Next atretch the flange on pattern, shown at P C in Fig. 104, by means of a stretching hammer and a square stake, and

which intersect with lines drawn at right angles to E, 2 in elevation from the points 1, F and E, 2, as shown. A line traced through these intersections will be the required pattern for the front and back of the flaring collar. A lap is allowed, as shown by R S and T U, which is riveted to the two pipes when joining, bending the laps in the same manner as shown in Fig. 103 at R and K. To obtain the pattern for the short side proceed as In the case just described.

the case just described.

It will he noticed that we have obtained the two patterns, one from the elevation and one from the plan, and that the miter cuts of these two patterns are alike. It should be understood that if the angles shown in plan by LNM or KMN were not right angles or square bends, the elevation could not be used for obtaining the pattern. But as the angles shown in plan, Fig. 105, are right angles, then for that reason can the patterns be obtained from plan and elevation as in this case, because the projection of the flare 2°2 of elevation, Fig. 105, is the same as the projection of the flare shown in

plan, as indicated by J J" or J J or II H or II II", for in obtaining the patterns, after having the stretchout, we have to deal with the projections only. In Fig. 106 is shown the method of joining a smaller pipe to a larger one by means of a flaring collar, the pipe being octagon. Let C D E F G II I J represent the elevation, L X O the plan view of the smaller pipe and M X the plan view of the larger pipe. It will be noticed that the plan view or pipe has alternate long and short sides. Before obtaining the pattern the first step is to obtain a diagonal section.

Let A B in elevation, Fig. 106, represent the straight hight of the flare, which place at right angle to one of the diagonal lines in plau, shown by X P. At right angles to X Pdraw X O equal in hight to A B of the elevation. Now where the line of the smaller pipe, shown by D E in elevation, intersects the diagonal or miter line X P in plan, as shown at T. draw a line from T at right angles to X P, equal in hight to A B of the elevation, as shown by T S in plan. Connect O and S and S and P, then will OSP X represent a section of the flare on the disgonal line X P in plan. tend the line X O indefinitely as shown by X V. Now extend the line S P in definitely until it intersects the line X V, as shown at T'. Then will T'S and T' Prepresent the lengths of the radii to be used in describing the pattern.

To obtain the pattern proceed as fol-

With T' P of the diagonal section as radius strike an arc with O as center in Fig. 107, as shown from P to R; now with T'S of the diagonal acction in Fig. 106 as radius strike another arc from the same center, shown from S to T. Draw a line in the pattern from the center point O, as shown from O to R, cutting the arc T S at T. Now take the distance of the short side S' P, plan view, Fig. 106, and place it as shown from R to A on the pattern in Fig. 107. Then again, take the diatance of the tong side P P' in plan view, Fig. 106, and place it as shown from A to B on pattern in Fig. 107. In this way the short and long sides are placed upon the patterns alternately until the pattern is complete, having four short and four long sides. From the corners of the pattern shown by R A, &c., draw lines to the center point O, Fig. 107, which cuts the arc T S at T C, &c. Draw lines from T to C and C to D, &c., which gives the widths of the sides of the smaller pipe shown in plan view in Fig. 106. The lines A C B D, &c., represent the bends, which can be made on the hatchet stake. Laps are to be allowed for riveting in joining the large and small pipe to the collar, in the same manner as shown by K and R in Fig. 103. If desired the collar can be made in separate pieces by simply cutting on the lines A C or B D in pattern, Fig. 107, using as many as re

#### FLASHINGS.

quired.

Frank Voightmann, 129-131 North Franklin street, Chicago, is to furnish the galvanized iron cornices, skylights and tile rooting for Judge Lambert Tree's Artist Studio Building, at Ohio, State and Ontario streets. The ornamental pressed work used on cornices is to be of special design.

IN ORDER to better meet the pressure of orders for their Star ventilators Merchant & Co., Incorporated, have erected a large two story building as an annex to their tin plate and smelt-

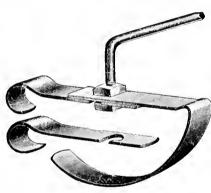

ing plant on Washington avenue, Philadelphia. The new building, which covers a ground space of 50 x 100 feet, will be devoted entirely to the manufacture of Star ventilators. The firm made a notable shipment recently of two carloads, comprising 160 large-sized Stars, to the Pscific Coast, where they are to be used on a new hospital at San Francisco.

Knork & Blocks, 165 Wells street, Chicago, are to furnish the galvanized iron cornices, bay windows, skylights, &c., for the store and apartment building of Martin Fischer, Roscoe boutevard and Woodside avenue.

Allen's Cornice and Corrugating WORKS, 422 and 424 West Randolph street, Chicago, are now installing their new machinery for the manufacture of round and corrugated conductor pipe and gutters. The machinery is of the most improved character, and will turn out work in 10-foot lengths. Samples made on the machines, when they were tested before leaving the factory, show an unusual perfection of finish. expected that the machinery will be thoroughly adjusted and in regular operation by September 15. A large stock of pipe and gutters will then be regularly carried. Among recent contracts taken by these works is one for skylights, pipe, gutters, &c., for a freight warehouse for the Chicago and Northwestern Railway, at Chicago. The building is 560 feet long and 66 feet wide, and required 18 ten-light skylights, 1700 feet of pipe and gutters and other galvantzed iron work. Inquiries are improving.

### The Tuller Eave Trough Hanger.

The accompanying illustration shows the Tuller Eave Trough Hanger, manufactured by W. E. Tuller, Willink, N.

The Tuller Eave Trough Hanger.

The portion that engages directly with the trough is not fastened to the trough by soldering or pinching with tongs or special tools, but is simply clamped around it, making, it is claimed, a neat, atrong and durable job. For repairing an old rusted trough these hangers, according to the manufacturer, have proven themselves particularly serviceable. In case of the trough beserviceable. In case of the trough being rusted through, causing a leak which cannot be soldered, a little thick paint or putty is applied over the hole on the outside, then a small piece of tin bent to conform to the trough is placed over the putty, and one of hangers snapped over it, the these the supporting rod being nailed to the roof. This operation completes the job, and as the manufacturer states, "the time required is ten minutes, charges according to the amount of

satisfaction depicted on customer's countenance." In putting up new trough, especially long lengths which have to be soldered after placing in position, these hangers are said to be very useful. The ends of the troughs cau be slipped together in the usual manner, tirst applying a little thick paint to the joint, then clamp on one of the hangers and the whole is completed, much tighter and stronger, it is claimed, than can be accomplished with a soldering iron under the caves of an old house or bern. A similar operation is gone through with in joining old and new troughs. The easy method of vertical adjustment is particularly alluded to as greatly assisting in giving the proper amount of pitch to the trough, the changes being made by means of the burns on the supporting rod. The hangers are now made in two styles and sizes, 3½ and 5 inches, galvaniz and japanned. They are packed in gross boxes.

### Rusting of Iron and Steel.

Mr. Bramwell is quoted as asserting, in an address before the British Association, that neither bright iron nor steel will rust in pure water or pure air. The presence of carbonic acid or some similar agent, he said, seems necessary, although the final product may be destitute of carbon; and even when oxygen, moisture and carbonic acid are all present, rusting will not take place unless the moisture condenses on the surface of the metal. When rusting does take place under ordinary circumatancea, the first stage appears to be the formation of ferrous carbonate, this carbonate being next dissolved in carbonic acid water to form ferrous bicarbonate, which latter is then decomposed in presence of air and moisture to form hydrated ferric oxide, magnetic oxide being found as an intermediate prod-uct. In regard to the progress of corrosion, a polished bar will resist oxidation for a comparatively long time, even under somewhat unfavorable conditions, but once the rust has commenced only a short time is required for it to cover the whole bar. One reason assumed for this is the fact that the rust is electro-positive to the iron; and it is partly attributable to the final product, the hydrated ferric oxide, being formed only at the end of several intermediate stages of the oxidation, and also to its hydroscopic properties, which favor the absorption of the moiature from the air. In certain situations other acids besides carbonic may take part in the corrosion of iron.

United States Consul Smyth, at Cartagena, Colombia, has informed the State Department of the completion and opening of the Cartagena-Magdalena Railroad, which runs aouth through the Republic of Colombia for a diatance of 60 miles to the town of Calomar. The railroad, which has been built by American enterprise, is expected to revive the former importance of the port of Cartagena, which has one of the beat harbora on the South American Coast.

Work on the new terminals of the Brooklyn Bridge is being pushed as rapidly as possible. At the New York end the new entrance and exit for trucks will probably be ready for traffic in the course of a week, while at the Brooklyn end the construction of the new terminal station, extending down to and over Sands atrect, to join the present structure, is progressing fast.

### HEATING po PLUMBING.

### NEW WORK AND CONTRACTS.

AT A MEETINO of the Stockton, N. J., Board of Education, last week, A. James Smith was awarded the contract for putting in heaters at the Rosedale schools.

WM. REARDON, Bridgeport, Conn., la building a house to be heated by hot air and have a plumbing system.

M. J. Kiehe has the contract for thoroughly overhauling the plumbing in the Park Hotel, New Britain, Conn.

GEO. RAPELYE, New Britain, Conn., is putting plumbing fixtures in M. E. Jacobs' house, at Berlin, where a windmill has just been erected.

F. C. WEIANT & Co., New Britain, Conn., have the contract for the plumbing of two tenement houses on North Stanley street for Walter P. Steele. They also have the contract for the steam heating of the Erwin Home addition; they are putting in 1300 feet of water pipe for the Standard Oil Company on the Berlin branch and are supplying John Pinches' residence with some new fixtures in the plumbing line.

THE CONTRACT has been given out for building the Winchester Building at New Haven, Conn., but the heating and plumbing contracts are yet to be awarded.

F. W. Tolles and Geo. C. Ham are building residences at Waterbury, Conn., that will be heated by hot water.

THE COWLES COUCH COMPANY, 116 State street, Hartford, Conn., have the following contracts on hand: A Caswell hot water heater in W. L. Wakefield's house; plumbing and Gurney heater at the Industrial Home for the Blind, Asylum avenue; a Gurney heater in Dr. Starr's house, Beacon atreet, and an H. B. Smith Company steam heater in a building on Wethersfield avenue.

THE SCHOOL BOARD of New Canaan, Conn., have awarded the contract for ateam heating in the new school house to Begent & Lynch of Stamford for \$753.

B. H. HILLIAR New London, Conn., has the contract for heating and plumbing Charles II. White's new house at Groton, and is also putting in a Richmond steam heater for James P. Johnson.

SHANGLE & SON, Hightstown, N. J., have the contract for putting a double Florida boiler in the Public School.

JAMES CURRAN & Co., New York, have the contract to put a heating plant in the St. Vincent De Paul Academy, and will use a Perfect hot water boiler.

APGAR BROS. 125th street and Seventh avenue, New York, are putting six Bolton hot water heaters in houses being built by J. M. Cahill.

THE COMMITTEE ON FUEL AND HEATING of the Council Biuffs, lowa, City Council have power to act in remodeling the heating plant in the High School.

PETER J. CARPENTER, Dobba Ferry, N. Y., is putting a Ftorida steam boiler in his own residence.

THE GREENSBURG, PA., SCHOOL BOARD has given the contract for heating School Building No. 3 to Painter & Sloan, and the contract for plumbing the same building to Shutte & Kaine.

THE REPAIRS AND JANTORS COM-MITTEE of the School Board of Reading, Pa., held a meeting last week and awarded the contract for extra steam heat radiation in the Boys High School Building to the Keystone Steam Heat ing Company.

SPICER BROS. have just taken the contract for plumbing the large and elegant stables recently erected at the residence of Henry Sturges in Fairfield. Conn. In addition to this they will also construct a sewer by which the house and stable will be thoroughly drained.

GEO. M. ROSSMAN, Keene, N. H., has the contract for heating the Lane Block and the Keene National Bank with steam, and will use the Exeter ornamental radiators, which were also used by him in the Y. M. C. A. Building.

THE SCHOOL BOARD of Upper Oswego Falls, N. Y., are considering a heating plant for their school building. It will be hot water or hot air.

THE BOARD OF EDUCATION of Genesee, N. Y., have authorized a committee to carry out a plan for heating one of their school buildings.

Hunt & Connell bid \$4770 and accured the contract for heating and ventilating School No. 19, at Scranton, Pa.

S. A. PHILLIPS has secured the contract for hearing and ventilating one of the schools in Barre, Mass.

H. W. Hubbard is putting in the steam piping and apparatus for heating the Gurnsey Building, at Keene, N. H.

F I. LESSARD & Co. Manchester, N. H., have contracted to put steam heat fittings throughout Towne's block. They are moving their sample room from 1268 Elm street into the Ray block.

THE PUBLIC BUILDINGS COMMITTEE of the City Council, Worceater, Mass., have awarded the contract for heating and ventilating the Abbott Street School House to O S. Kendall. The contract price is about \$2400.

EDWARD E. ELLSWORTH is putting a new steam heater in the cellar of the Temple of Honor Building, at Portland, Conn.

A STEAM HEATING APPARATUS is being put in the buildings of the Connecticut Literary Institution by the S. H. Beard Heating & Plumbing Company of New Britain, Conn.

THE CONTRACT for making the alterations and additions to the hot water heating apparatus in the court room of the Court House, at Green Bay, Wis., has been awarded to John F. Bertles for \$151 10. The galvanized from work, registers, &c., will be furnished by W. D. Cooke for \$272 88.

SEALED PROPOSALS will be received at the effice of the Supervising Architect, Washington, D. C., until September 21, for the work, including the roof covering, drainage, &c., for the United States Post Office Building, at Roanoke, Va. Copies of the drawings and specifications may be obtained from the office of the superintendent, at Roanoke, Va., or from the office of the Supervising Architect, Washington.

Among the contracts recently taken for steam heating by the Sam'l I. Pope Company, 207 Medinah Temple, Chi cago, can be mentioned the following: Four cottages for the insane at Newberry, Mich.; Administration Building, Minnesota Hospital for the Insane,

Rochester, Minn.; Parcchial School, Noble street, near Milwaukee avenue, Chicago: Peabody School, Noble and Augusta streets, Chicago.

At a special town meeting, at South Hadley, Mass., \$1800 was appropriated for a new heating and ventilating plant for the High School Building.

DESORMOUN & Co. bid \$1175 and secured the contract for heating the Clifton Street School Building, at Springfield, Obio.

KEHM BROS. & MERTZ 289 East Kinzie etreet, Chicago, are to install a hot water heating plant in the flat building of D. O'Brien, 635 Boulevard place.

B. D. Duggan, 207-209 Lake street, Chicago, is to supply a Rechmond hot water boiler at d necessary radiation for heating the Catholic school and sisters' residence, Hammond, Ind.

School No. 12, at Scranton, Pa., will be heated by stoum after the plan of the Smith Heating & Ventilating Company of Boston.

THE CONTRACT for the plumbing work in the new Colwell Building, at Ottaws, Ill., was awarded to Reed & Law.

THE BALTIMORE & OHIO RAILROAD COMPANY have let a contract to the Gold Steam Heating Company of New York for heating 500 ears by the hot water system.

THE SCHOOL BOARD of Macungie, Pa., have arranged to have an Auturn steam heater placed in the borough school building, to heat the four rooms. It will be furnished by Krauss Bros. of Kraussdale.

II. W. Hunnard is putting in a steam heating apparatus and piping to Gurnsey's new building at Hindsdale, N. II.

THE STATE HOUSE CONSTRUCTION COMMISSIONERS Of Massachusetts have executed a contract with Albert B. Franklin of Boston to furnish and erect the steam heating and ventilating apparatus in the State House extension.

THE DAVENPORT ETEAM HEATING COMPANY, Davenport, lowa, through their secretary, Mr. Abrens, have secured a \$5000 contract in Eldora, Iowa. The company have already constructed over \$15,000 in work in that town.

The J. L. Mott Iron Works, 311-313 Wabash avenue, Chicago, bave secured the following recent orders for their plumbing goods: New City Hall and Court House, at Minneapolis. Minn.; two public schools and Hull Seminary, at St. Paul, Minn.; public school butlding, at Terre Haute, Ind.; United States Givernment barracks, at Fort Leavenworth, Kan.; residences of P. D. Armour, Jr., E. G. Forman, M. O. Rosenberg and all of the stations of the Metropolitan Elevated Railroad, Chicago.

THE SMITH & ANTHONY COMPANY, 219 Lake street, Chicago, are to furnish their steet plate warm air furnaces for heating the five houses of F. R. Kirkham, Ravenswood.

BRAY & KATES, Arlington Heights, Ill., have the contract for ateam beating in the new public school building. The American Boiler Company's goods will be used.

EDWARD E PARKER, Woburn, Mass., has been awarded the contract for heating and ventilating the new armory at Stoneham, Mass.

# THE RETAIL STORE.

American Bread Knife.

The cut here shown represents a bread knife put on the market by the American Cutlery Company, Chicago, Ill. The makers refer to the knife as differbow down to success but quick to patronize and rather rejoice at a turn in the tide that changes the thood of some one else's presperity into loss or failure. We are apt to measure ourselves by others and measure others by

American Bread Knife.

ing in appearance from others both in the blade and in the handle. The handle is put on the blade of the knife by pressure, there being two small holes punched in the blade, into which lugs stamped on the inside of the slots of the handle fit. The lugs in the slot of the handle are placed over the holes in the blade and are forced into position by pressure alone.

### An Unsuccessful Venture.

A business man of prominence in an interior city refers in the following communication to his experience in connection with an unsuccessful enterprise in which he was persuaded to engage. We presume that many of our readers can sympathize with him in the result of the venture:

I had no conception how much the

I had no conception how much the world worshiped success until I had met with some severe losses. For a score of years, so far as the public knew, and also in fact, I had been successful. I had made mistakes and met with losses, but these were not equal to my profits in any one year and neither did I advertise them.

In course of time quite a number of people appeared to be anxious for my advice and I was invited to go into every new enterprise, being almost invariably told that my taking hold would be of value in securing help and subscriptions from others. So common had this become that it long ago had ceased to be a matter of any pride to me. I am afraid that I began to accept myself at the valuation other people seemed to place upon me and perhaps became too confident in myself and my own judgment.

At any rate, I invested in a certain business outside my own line and went in rather heavily. It seemed to have hard sailing, so I took hold of it in rather a prominent way, hoping to pull it through, but it was too much for me, and the concern failed.

The public must have had an exaggerated idea of my losses in connection

The public must have had an exaggerated idea of my losses in connection with this venture, for, as a fact, they did not seriously bother me, though, of course, I did not talk this way. My old friends sympathized with me in a patronizing way, as if mentally adding: "You ought to have noticed that we were not in that venture and have staid out." The people who used to call on me for advice came in now to commiserate with me and advise me not to go into such schemes in the future, and everybody took on very patronizing airs with me and they still treat me in that way.

It is both amusing and humiliating; it teaches that the world is ready to

their success or failure. It will be some time before I regain my position as adviser to the public at large.

#### Major's Ice Float.

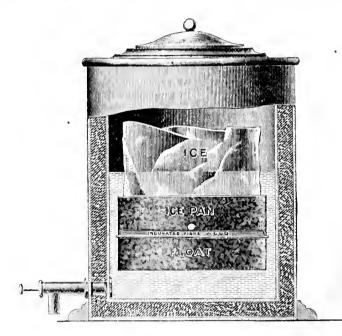

A. Major, 232 William street, New York, is affering an ice float for use in water coolers, as shown in the accompanying cut. The float is made of galvanized iron, the part described in the

the cooler. It is explained that the float is also adapted for use on steam-boats and railway cars, where in coolers without this device the water is constantly washing over the ice and melting it rapidly, as the float serves as a plug and prevents the water washing over the ice. Floats are made to order for equare and irregular shaped coolers.

#### MEMORANDA.

The R. E. Dietz Company, 60 Laight street, New York, are adding several new things to their line of lighting, heating and cooking goods. One is a glass font lantern, also a street lamp with a glass font. The Dietz revolving searchlight is a new lantern of great illuminating power.

THE UNION PLATING & MFG. COM-PANY, Freeport, Ill., are putting on the market a new stove poker with a coiled wire handle. In construction a slot is cut in the end of the poker, in which is inserted the end of the coil, after which the slot is closed by pressure, holding

Major's Ice Float.

cut as the float being 3 inches high, and the ice pan above 4 inches deep. The the ice pan above 4 inches deep. The floats are made regularly in all sizes from 6 to 14 inches in diameter, and are used in coolers whose inside diameter is 1 inch larger than that of the float. hole is provided at the bottom of the pan for letting the water out as the ice melts, when the pan is above the water. The maker states that water drawn from a cooler registers from 44° to 48°, while in the pan above the float it registers 36°, an average difference of about 10°. The point is made that drinking ice cold water results in much sickness and not infrequently in loss of life, while the use of the float will prevent both. It is claimed that the use of the float will make a saving of from 25 to 331 per cent. in the ice used, and that it is a perfect protection to the bottom of the coil firmly in position. The poker is full nickled, and is furnished with either straight or bent ends.

On August 22 the firm of Wright & Hutchison were dissolved by mutual consent. F. G. Hutchison will continue the business of hardware and tinning at the same location, 13 South Parke avenue, Warren, Ohio.

"SMITH OF NEW YORK" is the way the lamp trade speak of Charles G. Smith, 350 Pearl street, New York, who makes a specialty of lanterns, car lamps and all their fixtures in a variety of styles, sizes and illuminating power.

Warehouse accommodations in Baltimore are entirely inadequate to meet the enormous quantities of tobacco that have recently been sent to that city. The American Time Recorder.

September 1, 1894

The New National Time Recorder Company, Milwaukee, Wis., are offer-

the impression is made by the registering keys. By looking on the right of the dial, Flg. 2, it may be seen at any time of the day by the employer, or any one interested, that No. 2 was 15 min-

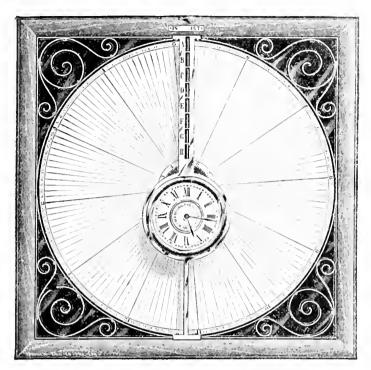

Fig. 1.-The American Time Recorder,

ing a time recorder, as illustrated herewith. The recorder is shown complete in Fig. 1, and will take a 21-inch tered. It is explained that by a novel

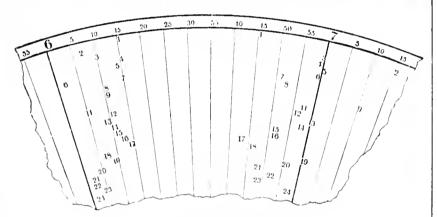

Fig. 2.-Portion of Record Dial.

record dial. In Fig. 2 is shown a portion of the record dial after a day's registrations have been made. The heavy lines are hour lines and the lighter once five minute lines. The figures to the

Fig. 3.—Registering Key.

right are printed in red and indicate the arrival of employees, while the figures to the left are in blue and indicate the departure of employees. The registration in two different colors is accomplished by shifting a little lever, which throws either a red or blue ribbon in commission, through which

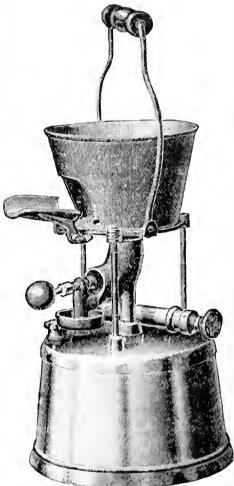

arrangement the numbers come conarrangement the numbers come consecutively on the record dial, and that the key, Fig. 3, will enter only the hole for which it is intended. A key is carried by each employee, and a sligh pressure upon it will ring a bell, indicating that a registration has been made. Within 15 minutes after the registrations have been made they come into full view as the cylinder revolves, and remain in view for about five and a half hours. The makers remark that they use the best eight-day movement made by the Seth Thomas Clock Company, which is sufficient guarantee for accuracy The recorder described will register 100 employees, and by using a number of recorders, as many as 1000 can register, the numbers coming consecutively. The low price at which the recorder is sold is a feature emphasized by the manufacturers.

Continued wet weather has caused much damage to the crops in many parts

of Europe. Harvest prospects, both in Great Britain and on the Continent, are reported as unfavorable.

### "Hot Blast" Plumbers' and Solderers' Purnnee,

The illustration herewith given shows a new plumbers' and solderers' furnace, which has been brought out by the white Mfg. Company, 40 and 12 State street, Chicago. It is a gasoline furnace, of unusually high heating power, intended for melting, heating of soldering coppers, &c. The burner has a powerful generator, which the manufacturers claim will not elog up. The pump is simple and quick acting. The reservoir is spun out of one piece of heavy 14 gauge sheet brass, covered with a cast top and will neither sweat nor leak. It is tested to 50 pounds' pressure and will hold 1 gallon, and

"Hot Blast" Plumbers' and Solderers' Furnace.

the furnace will run from 10 to 12 hours, according to the size of the flame used, without retilling. It will run three hours without repumping, and two soldering irons can be heated at the same time. It is fitted with patent renewable needle valve seat, which is also a feature of the Imperial hot blast blow pipe manufactured by the same company. The burner can be renewed for 10 cents, if it should wear out, thus making a practically new torch at very low cost. The blast or heat can be regulated to any desired degree, but it is so strong that the furnace can be used on roofs and other exposed places in the strongest wind without blowing out. The net weight is only 10 pounds.

# STOVE TRADE NOTES.

### The Local Stove Trade.

To be compelled to say that the local stove trade was no better than when last reported in these columns a month ago would be a sorry admission to make. It is better and improving all the time, though not as fast as is usual at this season of the year. Trade is later and stock orders will be lighter than

The effects of the long period of depression have been more severely felt in some sections of the city than in others. On the east side of the city, where dwell the poor, the loudest complaints of poor business are heard, and in order to keep the old stove together the people resort to measures that ordinarily would exhaust human patience. Many dealers say that they do not even sell stove bricks and grates, and that fire clay has taken the place of bricks altogether. People plaster the sides of the fire chamber with fire clay and wire the broken grate together, repeating the latter performance two and three times a week, being too poor to purchase a new article. The average of the sales of small stoves in the section of the city referred to has been about one stove in four weeks by any one dealer, or a total of about four stoves during the whole summer. Dealers say, however, that better business is now in prospect, and men in the neighborhood who have been idle a long time are daily obtaining work and expending their earnings for supplies, of which they have for a long time been forced to deny them.

Many heating atoves are carried over by dealers in this section, and purchases will be limited to cook stoves and ranges until the cool weather arrives and isst winter's stock is disposed of. On the west side of the city the stove business is in a better condition, and there are fewer heating stoves left from last year on hand, but dealers are very cautious and buy sparingly and generally decline to order their fall stock until the middle of September.

The conditions in the neighboring cities are practically the same as in New York. One thing is cartain—the needs of the people are many, and, if the weather should be cold during the fall and winter, the stove business will be one of the favored branches of trade and secure more than an equal share of the money distributed for furnishings. Prices are still well maintained and very little cutting is heard of.

The tariff matter is settled, and can no longer figure as a bugaboo to frighten

the people into the belief that some business calamity greater than the country has passed through still awaits it, and business can be adjusted to actual conditions. The atmosphere is cleared and improvement will be steady and sure.

### The Schuylkill Valley Stove Company

of Spring City, Pa., have just supplied their friends in the trade with copies of a very neat and tastefully printed catalogue of ranges and heaters is a volume of nearly 70 pages, bound in flexible covers, having in gilt letters a side title consisting of the name and The makers address of the company. state that since the last edition was exhausted many changes have taken place and that now they are in a position to cifer goods embodying improvements which cannot fail to interest the trade. The first place in the volume is given to the New Model, an entirely new six-hole range with ventilated oven, large flues, patent oven door opener, ilst or duplex grate, as may be preferred, and rich ornamen ation. The Ludies' Choice is another attractive range belonging to the same general class, this being followed by the Model Workman, a newly improved six hole range, made in four sizes and the usual modifications. O her goods include the Master Workman, the Valley Pride, the Grand Chief, the Vincent, the New Agnes and the Chief, the latter being a newly modeled sixhole range of attractive appearance. The leading place among the heating atoves is given to the Fame, made direct draft and full revertible flue. It is well made in all its parts and is referred to as being a powerful heater. Parlor Beauty, Valley King and Valley Queen are also attractive heaters embodying modern features and made in a variety of sizes. Cannon and laundry stoves, farmers' boilers, waille irons, cake plates and miscellaneous goods are also considered in the closing pages.

### The Perry Stove Company,

with main office and works at Albany, N Y., have just issued a 158 page ca'alogue of their leading specialties, which are offered under the name Argand. The edges of the pages are finished in light red, the corners are rounded and the covers are of muslin with side title in black. The frontispiece is a bird'seye view of the company's plant, which friends in the trade are invited to visit An explanation of the telegraphic code is incorporated in the catalogue, a statement of terms and a brief reference to prices and discounts occupy the opening pages, a ter which attention is invited to the Happy Home range, made in a variety of styles and sizes, for hard or a ft coal or wood. Next in order is the World's Argand, six hole range, with a full list of its constructive features. A broken view of the stove is given showing how the grate may he easily re moved. The Magic Argand follows,

prefaced with an illustrated description of the company's new grate known as the bi plex. Altoge her some 60 pages are devoted to ranges, which include the Standard Argand, Loyal Argand, New Gipsey, New Hero, Novel Argand, Glen Argand, Pacific Argand and Bob White. The next 15 pages are devoted to cook stoves, and then come the heaters. These are various in style and finish, and embody features which have rendered the Argand well known to the trade. The World's Argand base burner, with large hot air flues, occupies the place of honor, and is followed by such constructions as the Royal Argand base burner for hard coal, the Grand Argand, a member of the same class; the Derby, Fulda, Peerless Argand, Franklin, Tremont Daisy, Cadet, surface burner; Happy H me cottage parlor, Champion Todd, Elmwood, box; Lotos laundry and the The Royal oit and lamp stoves Aurora. are considered in the closing pages of the volume, also hot plate gas stoves, hollow ware, stove linings, &c. The volume is neatly printed, carefully arranged, and will prove a valuable addition to the dealer's library of stove trade literature.

### Stoves and Ranges.

BY PIPE HOLE.

You can read this with safety and possibly some amusement, for it ain't a sign and I don't want you to buy none. By the way, maybe you know the difference between a stove and a range, being as how you are in a stew or a fry about what to buy and how to pay for it and make a profit this year. Just as like as not you could tell better than I can, but I've got the bulge on you. I don't mean by that that you're an old stove with a bulge pot on bitin for me. Nothin personal; no. I do mean that this is my explanation and as I'm writing it you can't break in on me. I'm going to have my say clean to the end.

Between 20 and 30 year ago a stove was something to ecok with, and if something was wanted to heat the front room you bought an air tight or a gas burner or a radiator. They call them surface burners and revertible flue stoves now, but a stove meant something to cook with and the step stove was taking a back seat for the flat top now gener ally known as a cook stove. I reckoned you'd get your oar in and ask why a range wasn't a cook stove, as well as an oil stove, gasoline stove, gas stove and electric apparatus? Well, it is because they sin't got no pipe hole at the back, oven doors on both sides and three flues under the oven and several other reasons. Talk about your "base releaf" ornamentation and art design, the old Sea Shell of them times was a sample of deep carving that tried the molder's skill and made the blacker aweat and cuss. Some of them old panels showed a touch of genius compared with which a feller feels sick when he sees the congiomeration of paper mashay, limecrust and-water, stucko and putty, base imitations of things on the carth beneneath and under water.

My! what them fellers will have to answer fer. In them times a catalogue had the cook stoves, or cook's stoves, as a grammarian chap told me was the correct way to speak of them, all shown right in the front, in the place of honor, and the ranges took a back seat. The ranges were only little things then, used for summer work, and gradually they got to where they are to day, in the front in the eatalogues and in the people's favor. You see the cook stoves (it cost that rhetorical gent a dollar for me to struggle with "enok's stove" me to struggle with for his benefit in selling him a stove having the pipe hole at the back made them set away out in the kitchen. This was all right in the winter, for they not only heated the kitchen first class, but a drum heated the old man's bedroom, and leaving the back stair door open kept a feller's breeches from feeling like a snow bank when he coasted off of the hen's feathers into them at the dawning of the morning. It kept a feller cutting wood or burning coal to do this, and reduced the popularity of the stove somewhat, but in the summer vou cou'dn't eat in the kitchen and the flics in the butter, and the extra work of running to a table set in the shed opened the women's eye, and the range filled it full.

You see, a range don't have any oven door on one side and the pipe hole is on that side, so you set her right up agin the wall and it didn't take up near so much room. I know you want to ask if you couldn't set a cook atove the same way. Of course you could, but it wasn't the fashion and people didn't do it. Fashion's a great thing. Why, the gals wore galluses last year, even if it wasn't becomio'. cos 'twas the fashion. No; you couldn't set a cook atove like you can a range. The flues of a range are different, so that they work first rate with smaller fire boxes, and ranges have had the advantage of modern ingenuity and they certainly are handy.

But dld you ever order repairs for ranges from two different sections of the country? Well, its either amusin or exasperatin. To begin with, the left hand side of a cook stove is the back of a range and the back of a cook stove is the well, let's go a little slow and ask a question. When the oven is on the right hand side of the fire is it a right hand range or a left hand range? That is an unsettled question, some holding that the fire being the important, yes, indispensable, feature, that such a range is a left hand range. I think it is a right hand range, been brought up on it and think l'il stick to When you face the pipe collar of a cook stove you are standing in front of Well, just stand in front of a range and order a front grate and see what you get Some call that grate the end grate because it is in the end of the fire chamber; some, again, call the other grate in the open end ranges the end grate because it is at the end of the range. Money has been spent to make pictures of ranges with every plate in them numbered and printed the cuts in circulars and catalogues to prevent mistakes, and yet I'll bet a dozen pipe holes that some repair dealer lases some feller's trade before Christmas just because a range is different from a cook atove to order repairs for.

What is the remedy for this trouble? Oh! that's easy. Time, just simply T-I-ME In time we'll all sell gas, oil, vapor or electric stoves that we won't have to black, and much blasphemy will be avoided, as the fellow who now puts up his own pipe himself will have it done by an expert. If you

had a chance at me you would say that my explanation of the difference between a stove and a range did not display much tact in handling the subject. Well "set" on the "tact" if you like.

### ODD PLATES.

THE W. J. LOTH STOVE COMPANY OF Waynesboro, Va. favor us with a copy of a supplementary catalogue which they have just issued relating to Blue Ridge cook stoves, ranges and heaters. The 24 pages of which the pamphlet is composed carry illustrations of a varied assoriment of the goods named, together with sizes, oven and fire box dimensions, prices and brief descriptive particulars. The leading range is offered under the name Fannie it being a new cheap five-hole construction intended for burning coal or wood as fuel. It is made in five sizes with ovens ranging from 14 x 13 x 10 inches to 18 x 17 x 111 inches. The cook stoves include the F. F. V. and the New South, each made in six sizes for coal or wood. The heaters include the Blue Ridge Franklin, made in three sizes; the Templeton, a neat cottage parlor in three sizes; the Valley, a cheap dwarf stove; the list of hollow ware is also presented. Mascot cannon and the Carey box.

THE PENINSULAR STOVE COMPANY of Detroit, Mich., and Chie go, Ill. are now fitting up the Commercial Hotel, Monticello, Wis, with a Peninsular heating and ventilating plant.

"PERSISTENT PERSEVERENCE PRODUCES PROSPERITY" in cardinal ink, with the initial P of commanding prominence in each word, adorts the back of all of the envelopes sent out by F. M. Borden & Bro. of the Quaker City Stove Works, Philadelphia, Pa. In no line of business is this more true than with the trade with which they have the largest dealings. If it will make those who order stove repairs this fall stop and think it will add to their profits, which is synonymous with prosperity.

THE WORKS of the Somerset Stove Foundry Company, Somerset, Mass., resumed active operations on the morning of Monday, August 20, after a shutdown of about two months.

The Manchester Stove Company of Manchester, Ohio, have recently been chartered, the capital stock being \$15,000. Among those interested in the new concern are G. H. Halliday of Ironton, and J. N. Patton and J. A. Shiver of Manchester, Ohio.

THE DIPPO MFG. COMPANY of Chagrin Fal's. Ohio, are booking orders in a way which indicates a rapidly growing popularity for their goods. The demand is such that they have recently increased the force of hands by 50 and are now running full time and capacity.

Syracuse Stove Wonks of Syracuse, N. Y., call the attention of the trade to the merits of their Welcome double oven range, which is made both portable form and for brick setting. It has smooth castings, large broiling surface, extra linings between brick and oven plates, flues so disposed as to be easily cleaned, and water back which can be used either right or left hand. Attention is also invited to the Kernan warm air furnaces, made by the Kernan Furnace Company of Utica, N. Y., who, with the concern previously mentioned, invite members of the stove and furnace trades to visit the New York State Fair, to be held at Syracuse, September 6-13,

inclusive, and inspect the lines of Welcome stoves and ranges, as well as Kernan warm air furnaces, which will be on exhibition

The Hersh Furnace Company of Leighton, Pa., are distributing a package of advertising matter which is likely to interest the dealer who is desirous of keeping up with the times. One of the little folders is entitled, "A Burning Question," being in substance an answer to the query, "How shall we keep warm this winter?" Another tells all about the Lehigh furnace, for house heating, giving a table of prices, also of the capacities of the various sizes in which it is made and mentioning the principal features of construction. Still a third gives a "seasonable hint" to those who have a house to warm the coming winter.

Charles W. Richards, temporary receiver for the Simonds M'g. Company, 50 Chiff street, New York, has recently issued an announcement to the effect that under the order of the court he is authorized to continue the business of the concern, and preserve and promote its interests pending reorganization of the company.

THE SCHNEIDER & TREUKAMP COM-PANY of Cleveland, Ohio, favor us with a copy of their 1895 catalogue of Reliable gas heaters parlor grates and radlators. It is a neatly printed pamphlet of 48 pages, profusely illustrated and bound in paper covers of rich design. General directions for operating and taking care of Reliable heaters constitute an interesting feature of the early pages, while a telegraphic code composed of words beginning with the letter "F" occupies the last page of the publication. The intervening pages are devoted to gas heating contrivances, ranging from the handsomely decorated base heater, provided with a 12½ inch atmospheric burner, down to the four-flue radiator for coal or water gas. A novelty for the season of 1895 is a heater which is said to combine the beauty in design and finish of their radiator, "with the powerful heating qualities of an incandescent fire back." It has Russia iron radiating tubes, cast Iron asbestos back fire box, mica doors studded with jewels of different colors, and large radiating surface. The company will offer the trade two styles with two sizes in each. Class A will have a corrugated body, and class B a Equare body. The designs of the parlor grates shown are rich and effective, and they are offered in both plain iron and brass finish. An assortment of gas burners is also presented.

TAUNTON IRON WORKS of Taunton, Mass., have just sent out an exceedingly neat trade price-list, known as No. 4 E, and intended to "supersede all previous lists." Its 24 pages are printed in a tinted ink and bound in dark green paper covers carrying side titles in old The goods covered are made under the generic name Quaker, all of which have on the oven door plate the head of a Quaker, which is "a guarantee of excellence." Prices are given of the Grand Quaker, Quaker Crown, Quaker Prize, Art Quaker, Quaker Junior Art, Quaker Crown Hotel and Quaker Hotel ranges, New Octagon oval parlor, New National Record, Frankfort, Blossom Bud and Comfort heating stoves, portable oven and tailor atoves, chimney tops, broilers, kettles, ash doors, water front couplings and hollow ware.

THE PEERSKILL STOVE WORKS, 12 Peck slip, New York, report a good trade on the Rex range, their latest pro-

duction with closed end. It is a fivehole range with tlat grate, end shelf, oven door kicker, nickel panel and very pretty. They will soon show samples of a new square stove that is coming.

"In ordering repairs be very explicit" is the first sentence in large letters on a very seasonable six page circular devoted to stove repairs that is being sent out by the Stove Manufacturers' Repair Association, 233-235 Water street, New York. In addition to some valuable suggestions about ordering stove repairs there are five sectional cuts showing the plates in stoves of different construction all numbered so as to avoid mistakes. A list is given of the manufacturers whose repairs are in atock, also a list of the water backs carried.

J. M. REILLY has just returned from a Southern and Western trip, and is the guest of Al-x. B. Johnson, manager of the New York house of the Raymoud & Campbell Mfg. Company of Middletown, Pa They are both pleased with the advance sheets of the new catalogue that will soon be issued, which will be of white paper, with a buff tint in center of the page, on which the cuts and letterpress will appear. The sheets now being distributed are of their new Square Parlors, the Art Perfect, Perfect Gem and Perfect Square. Both the sheets and stoves are well worth seeing.

Shinnick, Woodside & Gibbons Mfg. Company of Zancsville, Ohio, proprietors of the Union Foundry, are distributing a new price list of their leading specialties. It is of a size convenient to carry in the pocket, is profusely illustrated and bound in colored paper covers. The principal lines of ranges and cook stoves are made under the name Sensation, the company offering the trade 60 styles and sizes, adapted for burning coal or wood. These goods embody the modern features and arc ordamented in a neat and tasteful style. Attention is also given to the Sentinel, the Escort, Sensation Wood, White Oak, Indianola and Winona. Among the heaters may be mentioned the Red Oak, made in three sizes and ordamented nickel and tile; the Sensation Oak, the Gem Franklin, the Scout, the Comfort, the Fairy Dwarf, the Nons, the Meda, the Burnaide and the Woodside. The Dew Drop has been improved and is offered full nickeled in two sizes.

The Wrought Iron Range Company, with main effice and works in St. Louis, Mo., and branch in Toronto, Ont., send us a poster of liberal proportions showing views of numerous specialties of interest in connection with kitchen and hotel outfits. At the top is a picture of the Home Comfort wrought steel hotel range, below which are oyster cookers, soup tureens, chafing dishes, wills irons, gas cake griddles, soup stock pots, ice cutters, combination slicing machines, &c. On the other side of the poster are illustrations of Home Comfort urns, Home Comfort salorn and restaurant lunch tables, gas wifll; stoves and individual chafing dishes. Accompanying the cuts are brief descriptive particulars, together with the sizes and capacitles in which the goods are made.

THE CARTON FURNACE COMPANY of Utica, N. Y., have just issued for distribution by their agents five circulars descriptive of a similar number of their leading specialties. The circulars consist of four pages each, printed in blue ink and illustrate and describe the Car-

ton low gas tight self cleaning furnace, Carton's Tropic furnace with return flue radiator, Carton's Junior furnace with east iron return flue radiator, Carton's Phænix steel dome furnace and Carton's soft coal hot blast smoke consumer. Each circular also gives the dimensions of fire pot and casing of the various sizes in which the particular heater described is made.

THE ATTENTION of those who pass the New York office of the Central Oil Gas Stove Company is attracted to their new Parlor Dome oil heater, occupying one of their show windows. one of their latest productions, which is made entirely of cast iron, with the exception of the oil tank, which is a scamless drawn steel reservoir, heavily tinned and fitted with a circular wide burner. It is made in three sizes, giving respectively 10, 12 and 15 inches of flame burning on the central draft principle, which, it is claimed, accures odorless combustion and produces an intense heat. The stove rests ornamental tray having castors. The stove rests on an design of the stove is at once pleasing and graceful, the lower portion being an irregular globe supported by appropriate feet and receding above the center, where foot rest is attached. Above this point it increases to a large diameter, at which point the flame exerta its force and the handsome dome with its ornament surmounts the whole. stove is said to have the capacity to heat a large room. The summer goods, of which the Improved oil gas cook stove was the leader, are being arranged to occupy less space, and preparation is being made for the heating stove line, which will contain many improvements and some new features. A fine line of lamp stoves is shown, of which the Florence is still the favorite. In gas goods their line is not confined to heaters and cooks, but they show in addition sad irona, griddles, broilers, sol-dering furnaces, plumbers' furnaces, sad iron heaters and a great variety of laboratory goods.

The Newest thing on the sample floors of Wm. Kerby, 4 and 6 Peck slip, New York, is a No. 240 Saxon furnace made by Isaac A. Sheppard & Co., Philadelphia, Pa. It has a heavy corrugated fine pot with a corrugated dome of peculiar shape resting upon it and supporting a large heating drum of No. 18 steel. A patent revolving scraper is placed in the drum for cleaning it. A lever shaking center slide grate and a dust flue are provided. It is put forward as a furnace to suit the times.

A card is being aent out by the Stove Manufacturers' Repair Association, 233 Water street, New York, that is blank on one side for the address and stamp and on the other side is a picture in brown ink of a heavy door with massive wrought iron hinges to which a atring is attached. "The latchstring is always out; pull it," is on the door and on following the suggestion an invitation is found to buy grates and bricks from them.

"Characteristic Catalogue Cuta" is the title of a 19 page selection of such goods as will interest builders and architects that is being issued by Isaac A. Sheppard & Co., Philadelphia, in the interest of Wm. Kerby, 4 and 6 Peck slip, their New York house. The first page shows their Paragon hot air furnace, which is claimed to be second to none, followed by the Saxon, "a furnace to suit the times." Four pages are then devoted to the Fidelity fire

place heater, with square or circular frame, embellished with nickel plate, with or without magazine and for hard or soft coal. "A few straws to show the wind of popular favor" precedes a scries of testimonial letters on the Fidelity range, cuts of which, in its different styles, occupy six pages. The last two pages are devoted to the Royal Fidelity, their newest range.

THE UNION STOVE WORKS of 70 Beekman street, New York City, are offering the trade the Paragon B 1894 range in additional sizes and new style of cabinet base. It is provided with patent oven door opener, large broiler door and heavy ash pan, Read's damper and broad moldings highly finished. The appearance of the range is massive and the ornamental features rich and tasteful. The company also invite attention to the Flirt B cylinder atove and the Durham and Lakewood ranges which have been improved for 1894. The company now make two sizes of the Red Cloud furnace and have added a large size to their line of Commander hot air furnaces.

THE EXCELSION MFG. COMPANY, St. Louis, Mo., are sending out a circular to the trade describing their hot blast soft coal heater. In addition to a view of the atove as it is set up, they also show a sectional view, giving the internal arrangement and construction, and also a view of the atove with the top outside section removed. The latter view is interesting, as it shows the dealer how readily the top section can be removed for the purpose of making any repairs that may become necessary. The circular states this latter feature is only one of the many which the atove has over others of its class. The circular is printed in black and red, and makes a decidedly attractive advertisement.

THE FRONT RANK STEEL FURNACE COMPANY, St. Louis, Mo, are preparing their exhibit which will appear in the St. Louis Exposition, which opens early in September. The exhibit will be exceedingly attractive and is expected to surpass any of their previous efforts.

THE ENTERPRISE FOUNDRY COM-PANY of Rochester, N. Y., are introducing to the trade a new radiator known as the Columbia. It is so made as to produce satisfactory results in operation, the claims being made that its use effects a saving in fuel bills and that "it utilizes heat which with other radiators is wasted" It is well made in all its parts, the flues taking the cold at in at the bottom and discharging it in a highly heated condition at the top.

Buck's Stove & Range Company, St. Louis, Mo, are determined that the trade shall not forget that they are the manufacturers of "Buck's stoves and ranges." With this purpose In view they have secured a very attractive sign which will be placed on the windows or doors of the merchants handling their goods. The sign is in the shape of their trade-mark, with the word "Buck's" in gold leaf and "stoves and ranges" in silver and robin's egg blue. These signs will be sent to the traveling men representing this concern and by them placed in position. The signs are imported, and as it takes considerable practice to correctly place the sign on glass, they have adopted this method so as to secure the most satisfactory results.

L. B. JONES, successor to the Security Gas & Vapor Stove Company of St.

(Continued on page 75).

# TRADE REPORT.

### The Iron Market.

The general tone of the market denotes improvement, which, however, is more in the volume of business than in prices. Less and less is being heard of the scarcity of Coke, and, to judge from the rate at which the furnaces west of the Allegheny Mountains are going in, the supply of Bessemer Pig promises soon to be ample.

Chicago has been active in the Billet market, closing about 18,000 for delivery in its own district, and taken some orders further East. Some business has been done in Pittsburgh for September and October delivery at \$16.85 @ \$17. The demand appears to come largely from Rod mil's which have made some sals to Wire works at a shade under \$24, sellers' mill. The Wire Nall factories and Barb Wire works are starting up again. In the East prompt Soft Steel is still source.

Raw material is certainly cheap. Reports have it that Messba Ore has been effered below \$2.25, lower lake ports.

Pig Iron.—The quantity of orders coming up in the New York market continues very small. We quote standard brands \$12 50 @ \$13 for No. 1; \$11 @ \$12 for No. 2, at tidewater. Southern Iron, same delivery, \$11.50 @ \$12.25 for No. 1; \$10.50 @ \$11 for No. 2; \$10 @ \$10.25 for No. 3; \$10.25 @ \$10.75 for No. 2 Soft, and \$10.50 @ \$11 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9.75 @ \$10.25

Philadelphia advices indicate a better demand for Pig Iron in that market, and sales can be made with less pressure than for months past, showing that consumers need material and that the supply is not out of proportion to the demands. There is not enough in it, however, to warrant predic ions of any material change in prices, all that can be said is that there is a broader market and prices are steadier. General quotations for Philadelphia or nearby deliveries are about as follows:

Standard No. 1 Foundry X	\$12 50 @	\$13.00
Standard No. 2 Foundry X	11.50 2	-1200
No. 2 Plaio	10.75 @	11.00
No. 1 Soft		11.75
No. 2 Soft		

The movement of local Coke Iron in the Chicago market continues up to the average of the past two or three weeks. Shipments are very heavy and the trade seems rapidly getting back to its normal condition. Southern Coke Iron is selling only in carload lots, but the demand for these is improving. Quota tions are given as follows for cash:

Lake Superior Charcoal	\$14.25 @	\$15.00
Local Coke Foundry, No. 1	10.25 @	10.50
Local Coke Foundry, No. 2	10,00 @	10,25
Local Coke Foundry, No. 8	9.50 🚳	10.10
Local Scotch	16.25 @	10.50
Ohio Strong Softeners No. 1	13.00 @	13.50
Southern Silvery, No. 1	@	
Southern Silvery, No. 2	@	
Southern Coke, No. 2	10.75 @	11.25
Southern Coke, No. 3	10.50 @	10.75
Southern, No. 1, Soft	10.75 @	11 25
Southern. No. 2, Soft	10.50 @	10.75
Tennessee Charcoal, No. 1	@	
Tennessee Charcoal, No. 2	a	
Alabama Car Wheel	17.50 @	18.00
Jackson County Silvery	15 25 @	16,00
Other Ohio Silvery	14.25 @	14.50

From the Pittsburgh district our reports show that the supply of Bessemer Pig is increasing and while no actual burnt out.

decline in prices has occurred, the tone of the market is weaker. Foundry Irons show no change, the demand being very light, but the supply is also limited to some extent and prices are fairly strong. Quotations are given as follows:

No. 1 Foundry......\$11.75 @ \$12.60, cash No. 2 Foundry.......10.75 @ 11.00 "

Our Cincinnati agent writes as follows: There has been considerable increase in the demand for Southern Pig Iron during the week, partly from consumers in this district, but largely from the Pittsburgh and Eastern districts, to be converted into steel and other finished product. The sales were in lots ranging from 100 to 500 tons, and in some instances reaching 1000 tons, but the demand was quite freely supplied at pre vious prices, and while the aggregate sales were satisfactory in volume, it acems to be considered doubtful whether they will keep up very long, for it is ex-pected that the free offerings of the Northern furnaces will quite fully supply the demand in some districts, but for the present and immediate future there will doubtless be wanted all the Iron which the Southern furnaces have the capacity to turn out. Soft No. 1 and No. 2 Foundry grades are still wanted in excess of the supply, although there is much more than there has been. Quotations are as follows:

Southern Coke, No. 1	10.75
Southern Coke, No. 2 9.75 @	10,00
Southern Coke, No. 3 9.25 @	9.5√
Ohio Soft Stone Coal, No. 1 14.50 @	15.50
Ohio Soft Stone Coal, No. 2 14.00 @	14.50
Lake Superior Coke, No. 1 12.50 @	13.00
Lake Superior Coke, No. 2 11.50 @	12.00
Hanging Rock Charcoal, No. 1., 16.00	17.00
Hanging Rock Charcoal, No. 2., 15.50 @	16.00
Tennessee Charcoal, No. 1 13.00 @	<b>13.</b> 50
Tennessee Charcoal, No. 2 12.00 @	$12.5^{\circ}$
Standard Southern Car Wheel 16.25 @	17.00
Lake Superior Car Wheel and	
Malleable 15 25 @	15 75

The local demand for Pig Iron in St. Louis is reported as showing a steady increase and sellers are in receipt of inquiries which indicate a continuance of the present activity. As the situation now is there are no large stocks of Iron on hand, and sufficient orders for future delivery are already secured to prevent any accumulation of Iron for the balance of the year. Prices are well maintained and there acems no immediate prospect of any change in either direction. A steady market is anticipated and will likely result. We quote as follows for cash, f.o.b. cara Sc. Louis. Quotations unchanged:

WALES & HAMBLEN COMPANY, organized at Bridgton, Maine, for the purpose of manufacturing, buying and selling tinware, woodenware, iron, copper, steel, z'nc. &c., has filed certificate. Capital stock, \$10,000, of which \$10,000 is paid in.

THE MOUNDSVILLE MINERAL WOOL COMPANY, Moundsville, W. Va., will rebuild their plant which was recently burnt out.

### Metal Market.

Pig Tin .- Prices have been adjusted to the new free of duty basis, and considerable business previously in abey-ance has been completed. Consumers have been purchasing more freely during the week to supply their pressing wants, stocks in their hands being very scant. As the bulk of the orders was for prompt delivery, jobbers and dealhave in some cases been hard put to it to supply requirements, as the great rush of business at the Custom House since the change of tariff has prevented their being able to draw out their bonded metal under several days' notice. Arrivals continue free, and the s'ock in first hands here has increased to probably the extent of 300 tons thus far this month. Prices are firm at the lower rates. Jobbers now ask for small parcels of Straits Pig 18¢ \$7 lb with an advance of about 1¢ on Bars. Probably these figures will be further reduced within a few days.

Copper.—The best efforts in the direction of s'imulating business have been slimly rewarded. Home consumers, as a rule, are well supplied and exporters have had no new important orders recently. In fact there has been little movement outside of deliveries on old contracts. Prices are somewhat variable for large lots, but are generally unchanged on small orders on a basis of  $10\frac{1}{2}\phi$  for Lake Superior Ingot. Jobbing business in both Ingot and Sheet Copper has been very moderate, but a rather better inquiry for the latter material is noted.

Pig Lend.—Under the influence of the lower duty prices have receded to about 3 30¢ for wholesale lots of Common Western, delivered in Saptember or later, 34¢ @ 3½¢ being asked for moderate jobing quantities. Only a moderate business has been effected, however, and the demand has not shown the degree of spirit that might reasonably be looked for in view of the exceedingly low prices. Possibly buyers are hoping for cheap foreign Lead later on. Manufactured Lead is also quiet.

Spelter.—Buyers are very indifferent, and it is the exception that they take more than they need for current use. Prices for small lots remain unchanged on a basis of about  $4\frac{1}{3}\phi$  for Western, with the usual premium for fancy brands.

Sheet Zinc.—Prices are weaker, 5¢ \$\pi\$ lb being the outside asked for 600 lb casks, and 5\pi\$¢ for smaller quantities. The demand is moderate.

Tin Plates —Several good sized contracts were closed early in the week for deliveries running through the last quarter of the year, to be imported under the new tariff. The prices were about 75¢ @ 80¢ a box under those current for spot goods. Toward the close of the week the interest in forward business was rather more tame, but still better than it has been for some time past. Coke Tins were mostly in demand in this connection and also for spot delivery, to fill up gaps in canners' requirements. There is some shortage

In special sizes of Cokes, and a consequent temporary advance in values for those Plates. Orders and Inquiries for spot goods have been rather more liberal during the week, but they still partake of the hand to mouth character which has marked them for so long. No buying for stock is likely to occur during September and only a moderate store business is looked for until consumers can get their supplies under the more favorable prices, which will probably follow the reduced duty on Oc tober 1. Prices generally display little change, but they are somewhat more uneven and depend largely on the urgeucy of buyers need, as stocks are There is a very fair current moderate. demand for American Roofing Plates. It is said that the leading importing houses are carrying very large stocks of Plates on the other side, which will be shipped after the middle of September, so as to enter under the new law.

A special cable dispatch from London to The Iron Age, dated August 29, reports on the British Tin Plate market as follows: Tin Plate business has been quieter. Buyers hold back, owing to the attempt of makers to rush prices upward. Ordinary Cokes are held at 3 pence adnary cokes are neid at 3 pence advance over prices that ruled a week ago. Other varieties are also held at more or less advance. Suipments have been light during the week, and there is now a stock of about 286,000 boxes at Swansea.

Sheet Iron. - Mills are busy and manufacturers' agents report an active demand for both Black and Galvanized Iron. Prices are firmer, acout 10 cent advance being asked by jobbers for small lots of Black Sheets over recent For small lots of Galvanized Sheets it is difficult to obtain more than 75 % off, and rumors are prevalent of an effort to be shortly made by the manufacturers to advance the price on this material. The jobbing business in Sheet Iron, though showing a slight improvement, is still very limited.

C. Kirchhoff, agent of the United States Geological Survey, has issued the following preliminary statement of the production of Lead for the first six months of 1894, as compared with the first and second half of 1893:

ha	First of 1894. et tons. 86,772	First hall 1893. Net tons. 95,621 16,305	Second half 1893. Net tons. 101,199 15,037
Total production Refined Lead Refined in Bond	102,382 21,392	111,926 12,230	116,236 22,770
Available for Home Market Contents of Mexi-	80,990	99,696	93,466
can and Cana- dian Ores	9,786	15,860	13,410
From American Sources	71,204	83,836	80,056

Included in the above Desilverized Lead are 2375 tons of Hard Lead produced in the first half of 1894, as com pared with 2401 tons of Antimonial Lead during the first half of 1893.

The most striking feature in the statistics presented is the heavy falling off in the quality of Lead drawn from domestic sources. It proves that the decline in the price of Lead and the prostration of the silver mining industry have very seriously affected the Lead industry of the Rocky Mountain States and Territories.

The stocks of Lead in refiners' hands Those received show a total of 2655 tors on July 1, 1894, as compared with 2468 tons on January 1. The stock of

Soft Lead was 2060 tons in the beginniog of the year, as compared with 1880 tons on July 1, 1891.

### Chicago Report.

Scrap.—Cast Iron is practically the only kind of Scrap moving to any extent. Dealers quote the following list of buying prices, Chicago delivery:

THE NEW HAVEN HEATING & PLUMM-ING COMPANY, New Haven, Conn, whose advertisement appears on another page, are directing the attention of the trade to the Ripid hot water heater. An illustration shows the general features of the apparatus.

CONTRACTS for most of the machinery for the new steel plant of the St. Louis S amping Company, St. Louis, Mo., were awarded last week. This new plant was designed by McClure & Amsler, engineers and contractors of Pitts. burgh, and is of modern design through out. The 34 inch Blooming Mill, Table Manipulator and Ingot Tilter, and also a three-high 26 inch double Plate Mill were given to the Frank-Kneeland Machine Company of Pittsburgh. The Fischer Foundry & Machine Company, also of Pittsburgh, received the contract for the hydraulic Bloom Shears and Tables.

ADVICES from St. Louis, Mo., indicate that the demand for Galvanized Iron, Black Spects, Tin and Terne Plates and Sh et Copper in that section shows a very decided improvement.

### CONDITION OF THE

## Hardware Trade.

THE IMPROVEMENT in trade noticed for some weeks past still continues. There is nothing to complain of in the number of orders received, but quantities are smaller than ceived, out quantities are smaller than they ought naturally to be at this season, although larger than they have been for some time past. It is still impossible to get particulars of the effect of the new tariff on the prices of the majority of imported articles. The only change definitely made as yet is in German Cham, of which we print the new prices elsewhere.

Advices from Chicago.—The Shelf Hardware jobbers report a broader Advices from Chicago.—The Shelf Hardware jobbers report a broader demand for goods than at any time since last spring. Merchants are buying only in small quantities, but their orders are more numerous and coming from a greater number of localities. They are not disposed to take calities. They are not disposed to take in stocks to any great extent, yet inquiries are being received more freely for anyloyd lets of stayle and the first of the stayle and the stayle are stayled. quiries are being received more freely for carload lots of staple goods. Some jobbing houses report that their business is larger than at any previous time this year, while others admit that trade is considerably better than it has been, but state that it is not yet up to negligible. A notable improvement conditions. A notable imnormal conditions. provement has taken place in heavy Hardware. The demand for Iron and Steel has grown very considerably within the past week. Inquiries are larger, and quantities taken show some indication among consumers of Iron and Steel to lay in better stocks. The demand for wagon and carriage material, however, is light.

### Notes on Prices.

Wire Nails.-The demand is quite active, and if the same condition prevails for the next fortnight it is generally thought that all the mills will be running full or nearly so. Quotations for carload lots at mill continue at \$1 to \$1.05, but for desirable lots these prices can be shaded, and sales have been made on private terms considerably under these figures. The New York price for small figures. The New Y lots is \$1.20 to \$1.25

Advices from Chicago. - Manufacturers appear to control the situation and are receiving larger orders and hetter inquiries. Prices are continued at \$1.15 to \$1.17\frac{1}{3}, Chicago, for factory lots, while jobbers quote small lots with concessions to heat human. with concessions to best buyers.

Cut Nails. - The improvement in demand previously noted continues without change in prices. We quote as representing the Eastern market 90 to 95 cents for carload lots on dock. The store price for small lots in New York is \$1.05 to \$1.10.

from Chicago. - Business shows a slight improvement in the demand from factory, but there is little disposition to make contracts for future delivery. Prices are continued at 95 cents, Chicago, on 60 cent average. Small lots from stock are quoted at \$1.10 to \$1.15.

Barb Wire .- Now that tariff uncertainty is over a stronger feeling characterizes this market, and makers seem to expect a gradual advance, although there is still some shading of prices. The following are the quotations for Four Point Galvanized, delivered at the points named: Pittsburgh, \$2 to \$2.05; Cleveland, \$2 05 to \$2.10; Cincinnati, Allentown, Chicago, or New York, \$2.20 to \$2.25.

Advices from Chicago.—Manufacturers are in receipt of a good run of mail orders, but they are almost wholly for amall lots. Carload buyers are rare even in localities in which dealers usually lay in large stocks. It is expected that the demand this fall will be principally of this character. Under such circumstances the trade is likely to fall more in the hands of manufacturers than job bers, although the latter report a much better movement. Prices are unchanged at \$2.35 for small lots of Galvanized from stock, and 10 cents off for carloads.

Wrought Iron Pipe.—There is less disposition to press sales. Makers have sold considerable Pipe and their views are firmer than at our last writing.

Bolgiano's Hot Air Gas Irous.— Bolgiano Mfg. Company, 415 Water street, Baltimore, Md., are selling their Hot Air Gas Irons from the following list, which is subject to a discount of 30 and 10 per cent. to the trade:

16	ach.
Kitchen Iron	2.00
Tailors' Iron	
Soldering Iron	2.60
A description of the Vitahon and T	ail.

A description of the Kitchen and Tailors' Irons was given in our issue Au gust 4.

Cordage.—Manufacturers' quotations remain unchanged, but jobbers are en deavoring to force sales of Rope, and are quoting prices from \(\frac{1}{2}\) to \(\frac{1}{2}\) cent below those of manufacturers.

Glass.-During the past week jobbers have experienced a better demand for Glass, and in quantities larger than have characterized orders for some time past. It is generally understood that jobbers control the larger portion of American Window Glass, and that A quality of Glass is becoming scarce. Factory prices have been weak for the past two weeks and are not as yet favorably affected by the slight increase in demand. The demand for Plate Glass continues satisfactory, and manufacturers report new orders. Pittsburgh factory quotations, which are shaded in some instances, are as follows: Single strength Glass, 80 and 20 to 85 and 5 per cent. discount; double strength Glass, 85 and 10 per cent. discount; Plate Glass, Eastern list, 70 to 70 and 10 per cent. discount, according to the size of glass; Imported Window Glass, 80 and 10 per cent. discount.

Old Metals.—Prices for Old Metals have been provisionally readjusted in accordance with the new tariff law. The following quotations represent about the rates now paid by New York dealers:

#### Stove Boards.

The Chicago S'amping Company, Congress and Green streets, Chicago, are making ornamented wood lined stove boards and offer them at the following net prices per doz n. Square, 26 x 26, \$10 20; 28 x 28, \$11 40; 30 x 30, \$12.60; 33 x 33, \$13 80; 36 x 36, \$15. Oblong. 26 x 32, \$14 40; 28 x 34 \$12 60; 30 x 38, \$13 80; 32 x 42, \$15. F.o.b. Chicago, usual terms.

### (Continued from page 72.)

Louis, Mo., is distributing an eightpage pamphlet which illustrates and de scribes Security gas stoves and ranges. These are attractive constructions embodying many interesting features, and with parts so arranged as to render them convenient and satisfactory in operation. One of the more prominent novelties is the Barbecue steak broiler, an illustrated notice of which appeared in these columns not many weeks ago. The circular gives attention to ovens designed for use in connection with gas stoves, and illustrates the Security three burner vapor stove. The last three burner vapor stove. page is taken up with testimonials from a few of those who have used Security gas ranges.

The Michigan Stove Company advise their cust mers to order Garland trade-mark cuts for advertising in home newspapers, so that connection may be made with the local dealer by those who read the leading magszines, religious, secular, agricultural and ladies' papers in which the Garland trade mak is now regularly appearing. The Michigan Stove Company believe in printers' ink and set a good example to the local dealers.

A VERY CLEVER ADVERTISING CIRCULAR has recently come to hand. The circular is a single sheet carrying an engraving of the Capitol at Washington, with a big sign hung across the front portico with the word "Closed," Beneath this most significant picture is the statement, "Now send in your orders for iron stove linings to Newton & Co., Albany, N. Y." This tells all the story of tariff agitation and prolonged and useless legislation and its effects on business interests.

EDWARD E. BARTO, well known to the atove trade from his visits in the interests of the novelty line, is taking a vacation at Salem, N. J.

Congress adjourned on Tuesday, to the intense relief of the country at large.

## English Trades Unions and Trades Schools.

The attitude assumed by British organized labor toward the trade and technical schools recently introduced in the United Kingdom is illustrated in a resolution adopted last week at the annual Trades Union Congress, in session at Norwich, England. The resolution was to the following effect: "That this Congress, while admitting that great and good work has been and is still being done by the establishment of technical classes in various localities throughout the United Kingdom. with a view of assisting in the better education of our handicraft and artisan work people, is of opinion that no others than apprentices and work people who are working at the various trades taught should be allowed to attend such classes." This means that, in the opinion of the labor leaders, the benefits offered by schools of trade instruction should be confined to those young artisans who are already under the direction of the trades unions. The schools are State aided and therefore supported by the public at large, but could this resolution be made operative their advantages could not be secured by any young man who is desirous of learning the theory and practice of a useful trade, unless he be already working at the special trade he wishes to study.

### Aluminum.

Aluminum, which a few years ago was little known ontside of the chemist's laboratory, has now come into considerable use in the industrial arts, and with its growing application to ordinary purposes there has arisen a natural curiosity about its properties and the best methods of working it. The special article that appears elsewhere in this issue will have interest, therefore, for many of our readers. It has been prepared by one who is familiar with the metal, and the ac-

count of its properties is clearly and concisely put; comparisons being made with other well-known metals, so that its relative usefulness for various purposes will be readily understood. The information contained in the article on the work of soldering aluminum will be found especially valuable, and judging from the frequent inquiries we receive about soldering the metal, the formula there given for a solder will be very generally appreciated. The difficulty experienced in joining the metal to itself by means of solder has, perhaps, as much as anything else, interfered with its more extensive use; and all of the books about this metal have referred to the difficulty, if not impracticability, of the operation. We are assured, however, by the writer of the article that if care be taken in the application of the solder he describes there will be no trouble experienced in obtaining a strong and permanent union. Though aluminum is already used for many purposes with the most satisfactory result, its many excellent properties warrant the belief that the sphere of its usefulness is destined to be greatly enlarged, and for domestic purposes, particularly, it is likely to come into still more general application.

### Outside Business.

"This is the last time I will ever interest myself in any outside business, and I will never loan another dollar to any one, be he friend or stranger, unless good collaterals are placed in my hands." The speaker was a middle aged Hardware jobber, who had just been telling us of his losses in connection with a recent failure of considerable prominence. "I had unlimited confidence in the honor of the man at the head of that concern," he continued. "I stood by him long after his credit was gone with others, and as a consequence I am just so much more a loser. I have had my fill. Hereafter I will attend strictly to my own business, and the man does not live who can get a dollar from me, except on good collateral. It does not do to bank on friendship, honor or confidence. Good collaterals will be good enough for me hereafter." Almost every snccessful man sees the hour when he is ready to say, and does say, just what we heard above. If he is making more meney than he needs in his own business his instinct leads him to use his surplus elsewhere at a profit. He has his favorite investment stock, or quietly buys notes or loans to others. For a time dividends come along pleasantly, loans are repaid with interest and he is pleased at his ontside income. Then come offers to take stock

in new enterprises, always pictured in the most rose colored light, or a man in whom he has unbounded confidence wants a little help. The monied man subscribes for some stock, he lends money to his friend, only to find that it is necessary to take more stock or lend more cash to save what was first invested, and in the end to lose all. Then follows the reaction. He is ready to vow, and does vow, that never again will he take stock in anything, and will lend no money unless secured by Government bonds. He usually keeps his vow, and the result is that a great many good things pass by his door, but they tempt the man that has not yet had this experience, while he pities the conservative fellow down the way who turned his face against so good a thing. In this way history continually repeats itself. Not all the new ventures, however, prove failures, nor is every loan a loss. If they were business would come to a standstill. The new company that Conservatism would not even consider is not infrequently the one that enriches all who entered it at its commencement, and the effect of one such brilliant success in the business world will ontweigh many failures. Yet the constant experience of the vast majority of successful business men is embodied in the homely old proverb, "Shoemaker, stick to your last!"

### The Forest Fires.

An enormous amount of damage resulted from forest fires in Northern Minnesota' and Wisconsin during the past week. A number of flourishing towns were wiped out by the flames and valuable tracts of timber land were ruined, the property loss running into many millions of dollars. The most serious part of the dreadful visitation, however, was the great loss of life. Over 700 persons are known to have perished, but it is believed that many others were lost of whom no trace may ever be found. It is one of the greatest calamities of modern times, causing a thrill of horror throughout civilizatiou. Now that such fearful consequences have resulted from earlessness concerning the inflammable nature of great forests in times of drought, it is likely that State legislatures will adopt measures to avert danger from this source. Public opinion favors the compelling of owners of timber lands to employ a forest patrol to remove dead trees, clean np underbrush and watch earefully for the first outbreak of fire. This should be done for the preservation of the own property, but it is most imper tively needed for the protection of f lives and property of those who live the vicinity of such forests.

# THE LETTER BOX.

### Wants Protection from Freezing.

From T. K. S., New Jersey.—Will some reader of The Metal Worker, who has had experience, please give me the benefit of it on protecting pipes from freezing? I have a 2-inch pipe that feeds a 1000 gallon tank resting on a trestle exposed to a full sweep of the wind. The pipe is 51 feet in hight and I do not want it to freeze. I had thought of wrapping with thick hair felt, then inclosing it in a box about 12 inches aquare and filling in around it with as bestes or minerel wool but am not sure beatos or mineral wool, but am not sure that this protection would prevent freezing in zero weather, and that is why I ask the readers for the information that they have gained from experience. I can get gas 50 feet from the pipe and had thought of getting a water heater and burning gas to run it, then running a 1-inch pipe up alongside of the 2-inch pipe, using a return bend and an air valve at the top and returning to the water. If some one can give me a less expensive method of insuring the pipe against freezing I shall be glad to hear

### Girls in the Tin Shop.

From FATHER, Pennsylvania. - I have sometimes heard men wish their girls were boys, and being more than proud were boys, and being more than proud of my daughters I concluded I would tell what my girls do for me. Ever since they were little things and when I used to do all my work with the help of an apprentice, they and their mother have attended the store and done errands in town and have gone to the city to order and buy goods till they underatood the trade as well as boys. They have had the best education our seminary could give them and are prime housekeepers as well as needlewomen, pianists and have some talent for art. Notwithstanding, one of them can mend thrware as well as I can, and has accommodated many a customer in that It is needless to say that her bench is kept in prime order, for occaalonally she does a little job now, though I run three men and a boy most of the time. One is a stenographer and keeps my books, and another is general stockkeeper, saleswoman and complaint clerk. They both read and understand The Metal Worker, and the complaint clerk is a very wise little woman. She can test a chimney as well as anybody and find the cause that prevents a stove from baking and give orders for the remedy. She can examine a range or furnace and note the repairs needed as well as I can. Her pony carriage is always ready to start to investigate what is needed to fill an order, and that lit tle horse earns his oats. A third sister thinks it great fun helping these two and now is a great help when they take a housekeeping bent, which naturally breaks out at times so strong that either their mother or I have to stay at the store. The complaint clerk learned through experience that a great deal of time was lost in going to see what was needed to fix a range, a heater, a leak, &c., so she got out the following blank,

which they insist shall be turned into the office all filled out. The blanks are alphabetically arranged for future reference after the charge is made from the time and material record on the other side, and any of your readers can appreciate that this is valuable informa-

NAME John Smith Address 18 Blank street

DATE....

ORDER. Wants range fixed, grate, boiler leaks, spout down. DESCRIPTION OF PROPERTY. House Frame Roof Tin and Slate GUTTERS Valley and hanging Bathroom Copper tub, siphon closet, wash stand, exposed nickel fillings. Kitchen No. 822 Grand range, water back, duplex grate, double oven, pattern, 1890, 5 1-2 pipe. HEATER, Hero, No. 247, combination hot air and hot water, cold air tube. Partition flues. no flue heads, 6-inch smoke pipe, also a No. 36 tested brick set heater with drums, 7-inch

### smoke pipe. WORKMAN'S REPORT.

Wm. Jones.	Day ending Jan. 14.		
Property.	Kind of work and material used.		
J. Smith.	Grate, 15 pounds. Set of bricks and putting in.		
14	New joint on boiler con- nection.		
şa.	Four tin straps putting up conductor pipe.		
	Property.  J. Smith.		

I can testify that it is worth many times what it cost, and as the men forgot, or neglected, or were at first opposed to this work, it cost those little women a lot of patient labor. Now a man will growl if he has to go to a job of which they have no account, for he is all at sea, but seldom fails to bring home a full record. When a workman is sent out his name is written on one aide and the address of the customer on the other, with the order for what is to be done. If it is an old customer who wants his range fixed, a new grate and bricks are sent If they are in stock, and often that is all that is needed, pleasing the customer and saving time. talking with a salesman they got a hint for this scheme:

FALL APPROACHES.

Is your furnace ready to have a fire started? Does it want cleaning?

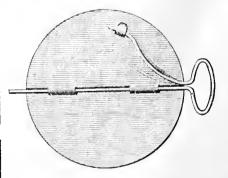

A new grate or fire pot?
Is the smoke pipe choked or rusted out?
Is the fire chamber of your range prepared to stand another winter?
Does it need the flues cleaned, the grate replaced and the lining renewed, or any new parts?

Is your roof in good condition?
Does it need repairing to stand the coming winter?
Should it be painted?
Are your pumps in order?
Do they need new leathers?
Everybody will be in a harry for what they want a little later. We will try to accommodate all, but shall fail. Wo have time now. If you are away send us the keys of your house. We will be responsible.

The girls are sending out this circular to everybody in town. It is very suggestive and printed in nest style, just the size to go in an envelope, and inclosed with the circular is a business card after their ideas. They are all mailed with an addressed postal card inclosed, and sealed with the instruc-tions "please forward." They will reach people at Luray, Niagara Falls, Lake George and elsewhere, and as the scheme has been tested by them they expect to be busy. You can imagine I do not work as hard as I once did, nor any harder than if my girls were all boys. It used to be my business, but now I hear it spoken of as ours, so that I appreciate that I have some partners who run it. They have made a great auccess of business, and their office and surroundings could not be more to the liking of any refined lady if they kept a millinery shop. This letter is a secret from them and their mother, from whom I could never keep a secret, and I wonder how they will like it.

### Hot Air Pipe Damper.

From A. L. Burtis, Lockport, N. Y. -I inclose a sketch of a neat and cheaply made hot air pipe damper that may be

Hot Air Pipe Damper.

of interest to your readers. I make them from scraps of galvanized iron, using No. 10 wire for the shaft or spindle, which being made in the shape illustrated gives it the proper bearing on the damper to prevent twisting, and at the same time makes a tight bearing on the damper to prevent twisting, and at the same time makes a tight bearing in the hole through the plpe which holds it in any position. The spindle draws out and is easily placed in the plpe. You will notice that there are no rivets or extra pieces used in making the damper. I will be glad to have you publish it for the benefit of your readers if you care to do so. readers if you care to do so.

### Furnace Estimate Blanks.

For the following furnace estimate blank we are indebted to B. D. Dug gan, Chicago, who has found them very

satisfactory in use. The blank, as herewith presented, has been reduced from its original size, which was 9 x 18 inches, giving plenty of room for writing and figures.

### Galvanizing Dross.

From T. E. S., Mich.—I have had some experience in galvanizing job work and have met with a great loss of metal from some unknown reason. The metal accumulates at the bottom of the pot as a sort of slag or dross. This has to be removed after a certain amount accumulates, or it will stick to the work in lumps and sal ammoniac will not remove it. I would like to be informed regarding the cause of and remedy for this trouble.

Answer. - During the process of "galvanizing," as the act of dipping iron in melted zine is called, the melted zine takes up a portion of the iron and forms an alloy, which, being heavier than zinc, settles to the bottom of the kettle. This alloy is caused to a certaln extent by the action of the melted zine on the surface of the kettle, and also from the amalgam formed when the iron articles are dipped, as the amalgam drips back into the kettle. As the dross contains from 3 to 10 per cent. of iron and other impurities, and from 90 to 97 per cent, of zinc, the loss involved is quite serious, amounting in some instances to from 25 to 30 per cent. While the dross is inclined to settle to the bottom of the kettle the dipping of articles causes it to be mixed with the zinc, and it is thus brought in contact with them, causing a rough surface. When the zinc becomes so filled with dross that it will not work properly, sufficient time is allowed for the dross to settle to the bottom of the kettle, when it is removed by means of a perforated iron ladle and cast in cakes for convenience in handling. The dross can be melted in a separate kettle at a high temperature, when it separates into two portions, the top being tolerably pure zinc. The lower portion can be again cast into cakes and sold to the refiner.

### Polishing Tinware.

From READER, Seattle, Wash.—Please inform me through the columns of The Metal Worker of the best methods in use by manufacturers for cleaning pieceā tinware.

Answer.—For cleaning or polishing pieced tinware, a soft cloth and refined whiting can be used, or the whiting can be used with a buffing wheel made of cloth.

### Token Money.

From G. F. W., Windsor, Conn.—Can you or any of the readers of The Metal Worker inform me what the coin or medal is which I will try and describe? It is made of copper, the size of an old fashioned copper cent. On one side is the picture of a man threshing grain with a stail, and the inscription "No labor, no bread." On the other side is the picture of a man plowing with two oxen tandem, and the inscription, "Speed the plow. Halfpenny token."

Answer. —The coin which our correspondent describes is a Canadian halfpenny token, issued for local circulation many years ago, and was at that time current as money. It was not, however, recognized by the Government and, therefore, was not actually legal

### Recording Stove Sales.

From L. P. & S., Hartford, Vt.—We notice the inquiry of "S. T. T.," in The Metal Worker, August 18, and the

In plates, rods and triangles its tone is equal to that of steel, but has a longer term, ending with a reverberation or resonance; in bells it has a brilliant tone.

By slow cooling from a red heat it becomes elastic or apringy, and may thus be converted into springs. Cooling quickly from just below a red heat, or by quenching in water, makes it very soft, analogous to the water annealing of steel. This is the best method of

reply of F. M. Borden & Bro., August We have kept a record of our stove sales for the past 24 years, using a journal ruled blank book with index, 84 x 10, ruled double column, which we further rule, as shown by the sample page sent. We have found it answers all purposes for a dealer in a country town.

### Aluminum and Its Properties.

BY Q. D. HISCOX, M. E.

Aluminum is now advancing rapidly to the front as a useful metal and, with its receding price, promises to soon come into general use in many manufactures where its peculiar properties make it a most desirable alloy, or its beauty and lightness give it a favorable precedence. It is now on sale by the silver and fancy goods trades for table ware, drinking cups, trays, wire basket work, bric-a brac and jewelry; is used in cab, carriage and harness trimmings, race horse shoes and the more substantial structure of voyaging boats.

The novelty of a violin of aluminum has been exhibited before the American Association for the Advancement of Science. Its sonorous qualities have recommended it for sounding boards of pianos and other musical instruments; it not being affected by moisture, its tonic condition is uniform.

Its lightness makes it a contribution in lightening the burdens of surveyors and engineers, it entering largely into the composition of their instruments. It is also agitating mliitary circles in Europe and the United States for lightening the soldier's equipment; canteens, buckles, cartridge boxes and gun trimmings of aluminum tend largely to lessen the military load.

annealing in working aluminum under hammer, rolls or drop press; or where convenient it can be rolled, spun or hammered at a temperature of 250° to 300° F., without annealing. It can be welded by electricity like other metals. Its malleability ranks next to gold and silver, it may be rolled and drawn to silver; it may be rolled and drawn to the thinnest sheets and wire, spun and raised in all forms as easily as copper; beaten into leaf like gold and silver for decorative work. As less only  $\frac{1}{40000}$  inch thick it is impermeable to light, and shows no color like gold leaf by transmission.

A singular coincidence in its comparative weight and strength with steel is in the equal length of a suspended bar to support itself by tension, which in each case is about 23,000 feet; the sectional areas of the two metals for equal strength corresponding inversely with their relative strength and weight per cubic inch or foot. The tensile strength of sluminum in rolled bars is 26,000 pounds per square inch, and its weight 163 pounds per cubic foot. Its elastic limit in tension is 14,000 pounds per sausre inch of section. The range of expansion by heat is 0.0148 inch per 100 feet in length for each degree F.; being greater than brass and less than zinc. Its electric conductivity varies slightly by the observation of different experimenters, probably owing to variation in the purity and density of the metal, the average being 0.49 as compared with copper 100.

It is so slightly attacked by nitric, sulphuric or sulphurous acid that it makes an excellent metal for valves, cocks, fittings and pipe for conveying or holding these acids, either pure or attenuated with water. Hydrochloric scid and caustic alkali are ready solvents of this metal, while the vegetable acids have but a slow action.

The shrinkage in casting is much larger than in brass, being 14 inch per foot in length. In melting it becomes at first pasty at a low red heat and finally fluid at about 1200° F. Black In melting it becomes lead (plumbago) crucibles should be used for melting, although for small quantities crucibles cut from anapstone are good; Hessian or sand crucibles may be used by lining them with a paste of plumbago or powdered charcoal and molasses baked on. Any quantity up to one pound may be readily melted in a small forge or coal stove. Com-mon sait is the only flux used, but not Comaiwaya needed, except to protect scrap melting. Molds for ingots may be melting. Molds for ingots may be made of iron or soapstone, but for pat-tern work should be in fine molding sand, such as is used by brass founders, the molds to be partially dried on the surface after dusting with ground charcoal and blowing out the excess of dust with a hand bellows. Thorough venting of the mold and quick pouring as with small brass work will bring out sharp castings. Aluminum castings are now made by foundries in this apecial line at reasonable prices, so that amateurs and others may be saved the trouble of experimenting to obtain aluminum castings or any of its alloys.

The roiling or drawing may also be avoided, as the prices of rolled bars, plate, rods, sheet and tubes are very reasonable, and small quantities may be purchased as cheaply and of better quality than an inexperienced person can possibly produce the required shape. The trade price for ingots, as detailed in metal quotations, ranges from 60 to 65 cents per pound, while the rolled plates and sheets, in lots of 5 pounds and upwards, ranges from 90 cents to and upwards, ranges from 90 cents to \$3.60 per pound, according to the gauge; sample lots, 10 cents to 24 cents per ounce up to No. 24 gauge; above No. 24 and up to  $\frac{1}{1000}$  inch thick, 30 cents to 40 cents per ounce; sluminum rods,  $\frac{1}{8}$  inch to 1 inch, in lots of 5 pounds and up, \$1.20 per pound; wire, Nos. 6 to 26 gauge, \$1.10 to \$2.09 in quantity or for samples. per ounce: quantity or for samples, per ounce; larger than No. 16, 25 cents; Nos. 16 to 22, 40 cents; Nos. 22 to 26, 50 cents.

Aluminum solder, \$2.50 per pound,

or 25 cents per ounce, melting at about 500° F. A softer and easier flowing solder, melting at 400° or less, at \$5 per pound. These solders can be used with an alcohol lamp, or bunsen burner, for small work. A good and casy flowing solder may be made of an alloy of 5 parts cadmium, 2 parts zinc, 3 parts tin—melt the zinc and tin together and then add the cadmium; a amail sheet iron ladle can be used for making the solder, when it may be poured into grooves in a block of wood for convenient use. This solder melts at about 350° F., needs no flux and takes to aluminum by rubbing with a stick of sluminum, or a small spun glass brush, or by rubbing the pieces together that are to be soldered after the solder has taken on one of the pieces. The price of cadmium is \$1.35 per pound, or 10 cents per ounce.

Aluminum alloys with copper and iron, as aluminum bronze and mitis metal have been long known and used. An alloy of aluminum with 10 per cent. of tin makes a beautiful white metal, easily soidered with tin as a soider. An alloy with 10 per cent. of silver makes an excellent metal for table ware, cheaper than aliver, far less liable to tarnish than silver and more brilliant in color than pure aluminum. This alloy is easily soldered with the addition of 5 per cent. of cadmium to a portion of the alloy.

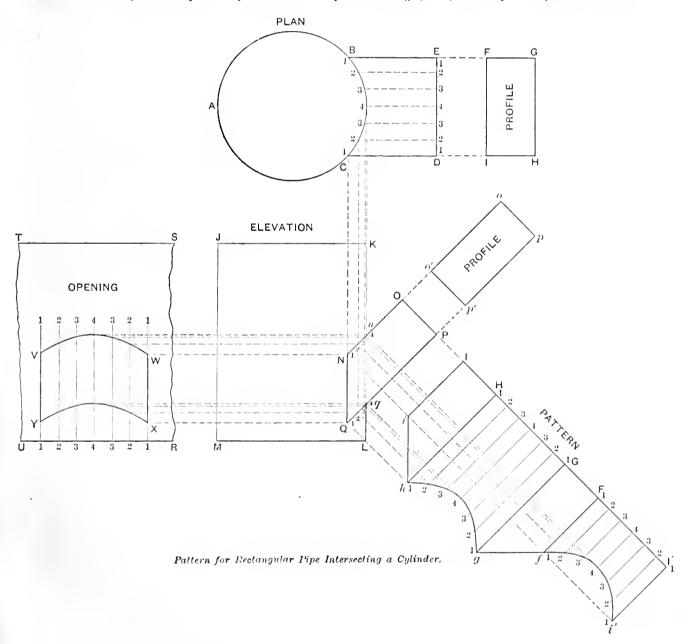

# THE TIN SHOP.

## Intersection of Rectangular Pipe with Cylinder.

From W. M., Brooklyn, N. Y.—I wish to intersect a rectangular pipe and a round drum at other than right angles. Will The Metal Worker please describe method for obtaining the pattern of the pipe, and also of the opening in drum?

Answer.—In the accompanying engraving let A B C represent the plan of P q so a line dropped from point C of plan will cut them, as shown by N and Q. Then  $n \in \mathbb{N}$  Q q is the joint between the drum and pipe, as shown in elevation. For the pattern of rectangular pipe proceed as follows: Divide B C of plan into any convenient number of equal parts, and from these points carry lines cutting E D. Also from the points in C B drop lines cutting Q P

sponding measuring lines, as indicated by the dotted lines. Lines traced through the points thus obtained, as indicated by  $i h g \neq i'$ , will give the desired pattern. It will be observed that I H h i is a duplicate of O P Q N, and that G F f g is also a duplicate, only in a reversed position. The points in h g of pattern are derived from Q g, as the points in f i' of pattern are derived

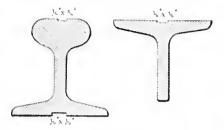

drum or cylinder, and B E D C the plan of rectangular pipe, the profile of which is shown by F G H I. In the elevation, J K L M represents the drum, N O P Q the rectangular pipe, and K n O the angle at which they are to intersect. Draw the end view, or plan, of circular drum in line with the elevation, as shown. Also extend O n and

and NO. On OP extended lay off a stretchout of prefile F G II I, as shown by I I', transferring the spaces in E D to H G and F I', and through the points in it draw the usual measuring lines as shown. Place the T-square parallel with the stretchout line I I', and, bringing it successively against the points in the miter lines N n Q q, cut the corre-

from N n. If the size of the work was such as to render it inconvenient to drop points from the elevation to the pattern by means of the T-equare, the stretchout line I I' could be drawn where convenient, the usual measuring lines erected and the distances from O P to points in N n and Q q transferred to lines of simi-

lar number drawn from the stretchout line. For the pattern or shape of opening in drum, proceed as follows: On L M extended, as R U, lay off a stretchout of B C of plan, and from the points thus obtained erect the usual measuring lines, as shown. Pisce the T-square parallel with M L, and, bringing it suecessively against the points N n and Q q, cut measuring lines of correspond-

Groover and Edger.—Fig. 1.—Cross Section of Groover Bar.

ing number. Through the points thus obtained trace the lines V W and Y X, which gives the shape of opening to be cut in the round drum. Necessary edges to be allowed for joining. If it is not convenient to obtain the shape of opening by means of the T-square, extend the lines from points in C B to M L, and, measuring in each instance from M L, set off the distances from M L to points Q q and N n to lines of similar number drawn from U R. Through the points thus obtained trace the lines V W and Y X.

### Groover and Edger.

From L. M. W., Delaware, Ohio.—I send The Metal Worker a description of some tools that may interest its readers. The groover is made of a piece of T-beam or railroad iron, about 10 feet long, with a slot cut in it lengthwise, \$\frac{3}{8}\$ inch wide and a scant \$\frac{1}{8}\$ inch deep, as shown in Flg. 1. The railroad iron is preferable, as a slot can be cut in the

to make a deep mortiae for the bar, as

shown in Fig. 2.

The bar is held in place by a good wedge which can be loosened and the bar removed when not in use. About 12 or 14 inches in front of the main upright and fastened to it by braces is a rest to sustain the weight of the bar when the outer support is removed. This rest is made of the joist and has a notch in it cut 6 inches deep and as wide as the bar with the bottom of the notch on a level with the mortise in the upright. A hole is bored in this rest so that a bolt can be passed across the notch just above the top of the bar to keep it from jumping, or if preferred a

Where a shop does not have a cornice brake to do the edging, an edger, as shown in Fig. 3, can be easily made on the following plan. The principal trouble with an edger is its liability to spring in the center. It must be made strong. Take two pieces of seasoned oak 2 inches thick, 8 inches wide and 9 feet long and join them together with extra heavy strap hinges. Cover the top side of both pieces with sheet iron that is free from buckles, to prevent wear. At & inch back from the edge, on one piece, fasten a strip of iron & inch thick, 1 inch wide and 8 feet 3 inches long. On top of the first strip of iron fasten another strip of iron fasten another strip of iron fasten

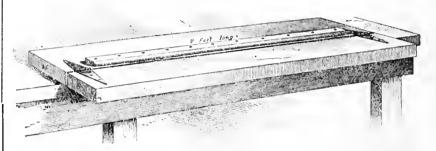

Fig. 3.-Edger Complete on a Bench.

hole can be drilled in the bar and the hole in the rest bored low enough for the bolt to pass through both. The hight of the bar from the floor can be arranged to suit the workman, but about 34 inches is convenient. Two treatles of the same hight, about 6 feet long, should be provided to support the work, or four rods suspended from the ceiling, with eyes in the ends for bars to support the work, can be used. The groover enables galvanized conductor to be made 8 teet long, turning the edges and forming on a cornice brake, then flattening the seam with a mallet in the slot, which leaves the outside perfectly round and the seam can be thoroughly soaked in soldering. It saves time and

inch thick, 1\frac{8}{2} inches wide and 8 feet 3 inches long, with its edge coming out to the edge of the plauk. Holes should be drilled in both strlps about 3 inches apart, large enough and countersunk for 1\frac{1}{2} inch No. 14 wood screws to fasten them securely to the wood. The top strip should be beveled from a round edge \frac{1}{2} inch thick to full thickness \frac{1}{4} inch back from the edge.

If different widths of edges are de-

If different widths of edges are desired on the material to be worked the holes in the under strip of iron may be drilled larger, or # inch in diameter, as

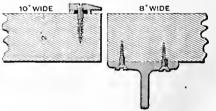

Fig. 4.—Cross Section of Edger at the Center.

shown in Fig. 4, so that by loosening the wood screws the under strip can be drawn forward or pushed back to make a larger or smaller edge, as desired, and the screws tightened again. There is little danger of this part of the edger springing as it will be fastened to a work bench by some means. When in use two bolts at 2 feet from each end are sufficient. To prevent the other part from springing a T beam fastened closed to the edge on the under side with screws 4 or 5 inches apart will be all that is necessary. A handle may be attached to this part about the center for convenience. The extra heavy strap hinges do not shut tight together, and allow the edge to be turned completely over.

Note.—Our correspondent's account of a home made groover bar would have been more useful if he had told how to cut the grooves in the surface. It would be quite atask to cut two 8-foot grooves with a cold chisel, which would have to be done unless the lot could be cut on a machine tool, say an iron planer or a milling machine.

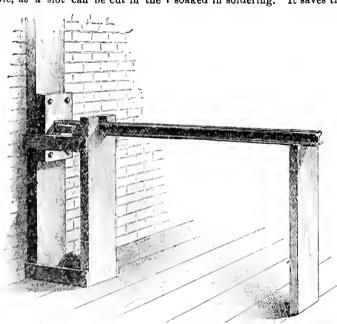

Fig. 2.—Groover Set Up Complete.

opposite side  $\frac{1}{2}$  inch wide and a full  $\frac{1}{2}$  inch deep for heavy material. One end of this slotted bar rests on a movable support, but the other end is tightly secured into a firm upright at the wall of the shop. The upright is a 3 x 10 inch joist fastened at the floor and ceiling with another piece securely belted to it at the point where the bar enters

labor and the conductor presents a better appearance on a building than if made in short pieces. In making the sheet iron work for ventilating shafts, indirect heating coil boxes, furnace supply pipes or any large work, two sheets of iron of full length can be more satisfactorily joined with its aid than in any other way.

# PLUMBING and GAS FITTING.

### The Central Supply Association.

In response to a call issued by John Walker of Detroit the members of the old Association of Manufacturers and Jobbers of Steam Fitting Supplies, together with other firms in the Central States who wish to join them, met at the Victoria Hotel, Chicago, on Monday and Tuesday, the 3d and 4th inst. Mr. Walker called the meeting to order, explained the long period of inactivity of the old association and presented letters from J. D. Abraham, formerly secretary and treasurer, regretting that the fire which destroyed his place of business had also destroyed the records of the association, and he had no means of telling what funds were on hand, but believed that there was not enough to pay his salary. On motion the old association adjourned without date.

After some discussion it was moved and adopted that a new association was desirable. Mr. Walker was made temporary chairman and O. F. Felix of Pittsburgh, temporary secretary. The following persons were present repre senting the firms designated: Geo. B. Hawley, Cincinnati; Mr. Deming of the George Worthington Company, Cleveland; E. H. Foster, Cleveland; John Walker of James Walker & Son, Detroit; O. F. Felix of the Pittsburgh Supply Company, Pittsburgh; Mr. Hibbard of the John Davis Company, Chicago; Mr. Morrison of the A. Y. McDonald Company, Chicago, and the A. Y. McDonald & Morrison Mfg. Company, Dubuque; Mr. Webster of Smith the Walcott-Hurlbut Company, Chicago; Mr. Weist of the Walcott-Hurlbut Company, Chicago; John Wolff of the L. Wolff Mfg. Company, Chicago; Mr. Weir of the Weir & Craig Mfg. Company, Chicago; Theo Abrens E. Of the Abrens E. Theo. Ahrens, Jr., of the Ahrens & Ott Mfg. Company, Louisville; James Harvey of the A. Harvey's Sons Mfg. Company, Detroit; the McIntosh-Huntington Company, Cleveland; Mr. Sullwold of the Western Supply Company, St. Paul; Mr. Lowin of the N. O. Nelson Faul; Mr. Lownin of the N. C. Nelson Mfg. Company, St. Louis; Mr. Whittaker of the L. M. Rumsey Mfg. Company, St. Louis; Mr. Webb of the Albert Webb Supply Company, St. Louis; Mr. Althaus of the Western Brass Mfg. Company, St. Louis; Mr. Fisher of the E W. Fisher Company, Cleveland; Mr. Bailey of the Bailey-Farrell Mfg. Co. Pittsburgh: Mr. Cleveland; Mr. Bailey of the Bailey-Farrell Mfg. Co., Pittsburgh; Mr. Kalvelege of the Hoffman Billings Mfg. Company, Milwaukee; Mr. Wulf of the Robert Rom Company, Milwaukee; Mr. Fowle of the Rundle-Spence Mfg. Company, Milwaukee; Mr. Kettig of the Milner-Kettig Company. Birmingham Ala. J. R. Clow. pany, Birmingham, Ala.; J. B. Clow of James B. Clow & Sons, Chicago; Messrs. Blatchford and Mcflvane of E. W. Blatchford & Co., Chicago; Mr. Boehnken of the Tromas Brass & Iron Works, Milwaukee; Mr. Seelman of the B. Hoffman Mfg. Company, Milwaukee; Mr. Henion of Henion & Hubbell, Chicago; Mr. Sanders of Peck Bros. & Co., Chicago; Mr. Bullock of the Illinois Malleable Iron Company, Chicago; Mr. Young of Snodgrass & Young, Chicago; D. A. Mudge of the J. L. Mott Iron Works, Chicago. Firms represented by prox-ies were the Toledo Supply Company of Toledo, Mansfield Mig. Company, Pittsburgh, and Merkle Bros., Cincin-

A committee on plan for permanent organization was appointed, which later reported a constitution and by-laws, that were adopted. In this constitution the name agreed upon for the association is the Central Supply Association. Its main object is as fol-

lows:
"A permanent organization of jobbers and manufacturers of plumbing, gas and ateam fitters' aupplies for the purpose of promoting more intimate and social relations of members of the same and with the trade, and correcting many evils that from time to time may exist and do exist at the present

The following officers were elected to

President, John F. Wolff of the L. Wolff Mfg. Company, Chicago;

First vice-president, John Walker of James Walker & Son, Detroit.

Second vice-president, Theo. Ahrens, Jr., of the Ahrens & Ott Mfg. Company, Louisville.

Treasurer, O. F. Felix of the Pittsburgh Supply Company, Pittsburgh.
Secretary, Wm. M. Webster of Smith & Webster, Chicago.

Quarterly meetings will be held regularly, the next in order being at Cleveland on the second Tuesday in December. Among the principal objects of the association will be the regulation of credits, and this is taken to mean the annihilation of the "dead beat" plumber in this territory, a consummation most devoutly hoped for by the reputable members of the craft.

### The Use of Lead Pipes for Conveying Water.

This subject may appear to some of our readers to have been completely threshed out, says an English exchange, but it is quite clear that scientists do not think so, for the Chemiker Leiting, which is the leading paper on chemical industries in Germany, recently contained a long article by M. T. Lecco on the use of lead pipes for conveying water. This chemiat ex-perimented with a water which contained iron, calcium and magneslum salts, and had a total hardness of 24.8°, while it held in solution 0.5 gram of corbon dioxide per litre. He observed that the solvent action of the water was greater when the pipes were new than when they were old. But even after three months' constant domestic use the lead pipe gave 0.3 mg. of metal per litre of water allowed to stand 24 hours in it. After three hours' standing a trace of lead was obtained, but in water that had merely run through the pipe no lead could be distinguished. The obvious moral is that, in domestic installations moral is that in domestic installations when lead pipes are used, it should be recommended and possibly notified by placard near the taps that the water should be allowed to run for a few minutes before any is taken for culinary or driuking purposes.

### The Sanitary System of Ancient Rome.

The subject of the lecture in the University Extension course given at Rochester recently, by Professor Burton, was the water supply drainage and public baths in ancient Rome, and was illustrated by a number of views which added to the interest. The following is a brief of the lecture:

The question of the sanitary system of the old Romans may at first sight seem a commonplace and rather trivial one. Such is not the case, however. The Romans, we have seen, showed a remarkable degree of talent in political organization and likewise in gratifying the public desire for amusements. In a majority of ways the subjects of water drainage and baths seem small and of little consequence to the average being. Yet no part of the life of the Romans proves that they were a great and civilized people more than the care that they paid at all times to these subjects. The supply of water for public use, the public sewers and the baths for the populace were provided for from the early days of the city with a care and foresight that were truly surprising.

### The Water Supply.

The water supply of the city of Rome was varied in its extent at different times. Its sources were not the same at different periods in the growth of the city, either. The earliest source from which the city took its supply was the river Tiber. The Tiber was a very muddy stream and annually brought down vast quantities of soil. The river water soon became unfit for use. Wells furnished considerable water in early days. There was little or no rock in the vicinity of the city, however, and the wells held little but surface water. Some few springs existed about the city and the water from these was utilized. Chief among these springs was the one that sprang from the cavero on the Capitoline, where the Mamertime prison was aubsequently built. Claterna were not unknown, and the ruins of several still exist on the Palatine.

### The Aqueducts.

About the third century before Christ the Romans began the construction of aqueducts to bring the supply of water for the city's use from a better though less accessible source. The first aqueduct of any note was built by Appius Claudius about the year 300 B.C. Others soon followed, and before Augustus arose to power five of these great waterways had been completed. After the time of Augustus, and within the ancient period, it is known that six more were built. One was constructed also in the sixteenth century. Of the whole number four are now in use. The combined length of these aqueducts was 360 miles.

#### The Length.

Each had its source in some far away spring, small lakes or mountain stream. The aqueducts varied in length from 8 miles to 62 miles. Several are known to have existed that averaged 40 miles in length. These facts indicate the pains which the Romans took to procure a bountiful supply of pure water for public use. The mountain streams about Tivoli furnished the sources of no less than five of these aqueducts. One of the most noteworthy of these structures was the one that furnished water for the settlements on the Janiculum, on the river bank of the Tiber. This aqueduct was built by Trajan, and brought crystal water from a lake 30 miles distant. The lake is 500 feet higher than Janiculum, and the waterway is still in use. It now supplies the fountains in froat of St. Peter's. also feeds the well-known Pauline fountain on the same eminence. other of the ancient aqueducts that has survived is the one known as "Aqua Virgo." It has its source in a spring 8 miles from Rome. It was built by Agrippa to supply his baths, and now supplies three of the most conspicuous fountains in the Eternal City.

It would be difficult to determine, even approximately, the amount of water that the 11 different aqueducts delivered into the city. Several learned students have undertaken to estimate it, however. One estimate places the amount at 54,000,000 cubic feet per day that was delivered, while another says that 340,000,000 gallons came into the city a day. It is certain that the city had a greater supply of water than any city, sucient or modern, has ever had. Modern Rome, though having but a small amount of this supply, still

surpasses any other city.

### Their Construction.

The squeducts were not constructed in any very complicated way. The system of arches upon which was placed the waterway is familiar to all. early squeducts were constructed under ground. Tile or lead plpe was used. It was difficult to make these pipes strong enough and still more difficult to keep them clear and clean. water from the Appenines carried a large amount of lime, which was deposited in the pipes and sooner or later clogged them. The Romans tried to clogged them. The Romans tried to obviate this by slnking a series of shafts, but in the end it was found desirable to adopt the over ground system. Accordingly we find that all of the later squeducts are built in the air. Many of these aqueducts were under ground at the source, however. The Romans from an early date were familiar with the principle that "Water rises to the level of its source." Their knowledge of this principle is clearly brought out in their works. The methods of cugi-neering adopted by the ancients were very respectable and somewhat skillful. The tunnels often found at the source of the aqueducts are to all appearances constructed in a manner similar to that ia vogue at the present time.

The water channels were on top of the whole structure. The openings varied in size. The largest were about 2 feet in width and 31 feet in hight. The average channel was about a foot square. The channel was perfectly tight and the interior was carefully covered with pottery cement. This cement was made from powdered tile and water lime, and was very effective. It frequently happened that several channels ran along the same row of arches, one above another.

#### The Reservoirs.

At the terminus of each aqueduct was a reservoir. The Roman reservoir was not at all like ours. It was a large building with strong walls, and was usually highly ornamented in its architecture. The water was not only collected here, but it was allowed to stand and settle here before going into the distributing pipes. Whenever an aqueduct branched, which was often the case, a reservoir was erected at each branch. The reservoir always supplied the locality for a considerable distance around. The first class reservoir was around. The first class reservoir was divided into six departments, each supplying water for a different purpose. There was a acction set apart for the military, another that supplied the places of amusement. Then there were divisions devoted to baths, fountains, business and private residences. Some of the reservoirs were devoted exclusively to one department, as the baths of Agrippa, and other baths were supplied by a special aqueduct that led to the Palatine.

### The Distributing Pipes.

The distributing pipes that led from the reservoirs were all laid under ground. The pipes led to the main palaces and residences only. Very few of the tenements were supplied. These pipes were supplied. usually of tile and were often wholly Sometimes lead inclosed in cement.

pipes were used.

The public fountains, which were fed from these squeducts, were very numerous. It is recorded that Agrippa, when he was prefect, built 1300 new fountains. After his time they were even more numerous. These fountains even more numerous. These fountains were of three sorts. The most common was that of rushing streams, the water usually issuing from the mouths of figwhere the water spouted high in the air and the still water fountain, were very common. The modern fountains give a very good idea of what those of ancient Rome must have been like.

### The Drainage.

The drainage of the city of Rome is a malodorous but very important subject. In the life and progress of the city it plays a most important part. The site of the city is a very unhealthy one. The Tiber overflows its banks annually, and in early days the plains were covered with water each year. Since the land was so low the water remained a long time when it came. Mslaria was a universal complaint. The early was a universal complaint. writers make much of it in their works. The divinities that had to do with the fevers were very industriously wor-shiped. The natural defect in the city began to be remedied in the early kingdom, however. As early as 600 B.C. the region of the Forum was drained by a sewer. Part of the great drain still exists and is in use to day. The sewer called "Closes Maxima" was 14 feet in hight and 101 feet wide. floor was paved and an ordinary load of hay could be drawn through the aperture. Agrippa at the time he was in charge of the city passed through the great trunk sewer in a boat.

### The Sewers.

In the days of the empire the network of sewers throughout the city became even finer, until we have the testimony of Pliny to the effect that "Rome was a hanging city." In all the streets of Rome there were openings in the gutter to carry away the surface water. No system of traps for the prevention of the spread of noisome odors existed. The

drains in the houses were very similar to those in use at the present time. All refuse of whatever nature was carried

away by the sewers.

The banks of the river in the golden age of the city's prosperity were built up with high stone embankments. The overflow of the Tiber was thus prevented and the city more easily drained. When the city began to decline these walls fell away and the streets began to fill up. At present we find modern Rome far above the ancient city. instance, the old Roman Forum is 50 feet below the surface, while the Cam-pus Martius is about 12 feet under ground. This vast amount of earth was deposited largely by the river. The existence of the ruined buildings prevented the earth from being carried out to sea and facilitated greatly the filling in process. The old city became abandoned and the destructive agencies worked unchecked. The large amount of soil produced by vegetable decay aided in filling up the city.

#### The Baths.

The system of public baths was introduced into Rome in early times. At first the baths were small and simple in their nature. In the time of the empire the character of the baths changed. So much so, in fact, that the word signifying a bath became "termi," from the The baths of the city became much like modern club houses. served three purposes: 1, all forms of bathing were indulged in. Then there was an elaborate gymnasium attached to each bath house, where physical training, such as jumping, running, wrestling and boxing might be indulged in. Besides all this, the baths became places for social recreation. Loungers and men about town made their headquarters at the baths. Social intercourse, the reading of literary productions by the authors, consumed much of the time. In later days it became customary for the official announce-ments of the government to be read there.

The baths were built for public comfort, and were paid for out of the public treasury. They were free to all citizens, a nominal fee of 1 quadran, half a cent, only, being exacted. Foreigners were at some periods admitted free of Very generally the baths were charge. charge. Very generally the baths were designed for both sexes. The bathing suits were very similar to the every-day dress of the Romans. The bather was accompanied to the bath by his alave, who assisted him in all the departments.

The heating of the water and rooms was carried on through a system of fur-naces very much resembling those of our time.

### Caulking Echoes.

Drawings were recently seen where a boiler 12 feet long and 2 feet in diameter was to be used to supply hot water for a building, the water to be heated by a steam coil of 65 feet of 1-inch pipe. Such a boiler would hold about 360 gallons and the ceil allowance was 1 lineal foot of pipe to every 51 gallons of water.

"The proper namea for the four pipes on an ordinary kitchen circulating boiler are supply, service, flow and return," said an aggressively proand return," said an aggressively progressive plumber. On asking an old school plumber if this was correct, he wanted to know "which was which," and observed, "I suppose the 'supply' is the cold water service to the boiler and the 'service' is the hot water supply to the house and the 'flow' is cold water to the water back, sometimes called the sediment pipe, and the 'return' is the return from the water back, and often called the circulating pipe. He further stated that these names could be simplified and made uniform to great advantage.

Another plumber claimed that he prevented by a peculiar arrangement the bursting of a pipe over a sink on an upper floor caused by suddenly closing the faucet. He cut eff the pipe below the faucet and removed the faucet. Then a long piece of pipe was connected with the supply pipe and extended against the wall in a large circle that reached to the ceiling. Where the pipe returned to the sink he put a faucet and continued the pipe atraight up to the ceiling to make an air chamber.

### TRAPS AND VENTS.

CHAS. S. WEDSTER, president of the Zero Valve Company and Assistant Inspector of Plumbing of Buffalo, N. Y., states that though trade is dull some of their valves and seata are being used. There is very little work in course of construction and the inapectors find less to occupy them than formerly.

As a result of a meeting between the Legislative Committee of the Master Plumbers' Association of Allegheny, Pa., and the plumbling inspector, several conflicting clauses in the present plumbing ordinance will be corrected in a new ordinance.

THE PLUMBER'S REGISTRATION BILL was withdrawn on its accord reading in the British House of Commons last month. It is said that there is no chance of the bill becoming law until ita present provisions are materially modified.

GEORGE PARKS has opened a new plumbing shop in South Omaha, Neb.

JACOB H. ERION has opened a plumbing and gas fitting establishment at 106 North Duke street, York, Pa.

UNDER THE LAW providing for the registration of plumbers in Massschuaetts, at Boston, up to noon of August 30, 729 applicants registered, of whom 499 were journeymen and 230 master plumbers.

R. G. HARRINGTON has opened a plumbing shop on West street, Ware, Mass.

THOMAS E. VEAL, Chief Sanitary Inspector of Atlanta, Ga., is agitating the subject of forming an association of sanitary inspectors. In a letter to Sanitary Inspectors. In a letter to Santary Inspector Ledsinger, Columbus, Ga., he refers to the subject as follows: "I sm anxious to form a Sanitary Inspectors' Association, and I would like to obtain your assistance and co opera-tion in making this association a success. Any suggestions in regard to this very essential subject will be appreciated by me. My idea is to have this association based upon all such organizations meet annually, discuss sanita-tion and means of making sanitary matters more perfect than 'to-day.'

THE FOLLOWING PERSONS have been THE FOLLOWING PERSONS have been granted master plumbers' licenses by the Board of Health of Glouceater, Mass.: Israel C. Mayo, Alonzo F. Harvey, Leverett E. Smith, James H. Hull, Levi W. Thurston, James Norman, J. McKinnon and William E. Tucker Tucker.

"COPPER RANGE BOILERS" is the title of a little pamphlet issued by Randolph & Clowes, Waterbury, Conn. the well-known makers of brass and copper tubing, shells, drums, &c. The little volume opens with a brief treatise on the operation of a house boiler, showing how to prevent accident. This is followed by a description of the advantages of Brown's patent seamless copper house boilers. Illustrations in silver and copper bronze show the general appearance of the boiler, and sectional view is presented. The last half of the little pamphlet is given up to testimonial letters. The cover is in scarlet and in imitation of watered silk.

THE J. C. BEARD PLUMBING CCM-PANY have been incorporated at Charleston, S. C., with a capital of \$5000. The incorporators are J. C. Beard, H. T. Beard and H. A. Holverus of Charleston.

BELCHER, FORD & Co., plumbers, tlanta, Ga., have retired. They will Atlanta, Ga., have retired. They will be succeeded by M. E. & C. W. Ford.

THE drought in the West has materially benefited one branch of business. created a strong demand for pumping apparatus, which includes wind mills, pumps, tanks, &c. The severity of the drought, surpassing anything experienced in a section accustomed to long stretches of dry weather, will very probably cause those who can raise the money to mitigate the destructiveness of future visitations of the same character by boring numerous wells and providing pumping appliances. The outlay will be heavy, but the benefits will much more than comparate for the will much more than compensate for it.

WILLIAM CAMPBELL, well known to the supply trade through his former connection with Eton, Cole & Burnham, T. R. McMahon & Bros. and E. S. Keating, is about to open a supply house in Harlem, having leased the large and handsome stores 313 and 315 West 125th street, New York, where he will keep a full atock of supplies for plumbers, gas and steam fitters and engineers. The store will be open for engineers. business about September 15.

## Gas and Gas Fitting.—

BY J. W. HUGHES.

### Finding Leaks.

If the application of the test pump reveals the unpleasant fact that the job is not tight, it will be necessary for the fitter to hustle to find the leaks. Should the rapidity with which the gauge falls after being pumped up demonstrate that the leak is a large one, but little time or trouble is likely to be required in finding and remedying the defect. First go over all the caps and see that none of them is loose and that no nipple or drop has been left out. All the time the job is being gone over keep the ears open, and have the pump steadily worked, as the sound given off by the eacaping air will frequently lo-cate the trouble. For this reason it is well to test during the dinner, or before or after working hours, when comparative quiet will reign in the building. If all caps and nipples are found properly secured, then look for splits in the pipes, the usual place for such defects being where the tongs have gripped the pipe in screwing up. If the gauge falls very slowly, demonstrating the leak to

\* Copyrighted, 1894, by David Williams.

be a small one, there will be much more trouble in finding it.

One method of locating the leak is to mix a quantity of strong soap suds, and with a clean brush generously apply the mixture over the surface of the different pipes, at the same time watching carefully for the bubble that will be blown, from even a very small leak, by the eacaping air. It will, of course, be understood that during all these operations the pump must be kept steadily working. Another method is to pour into a cup on the pump, provided for the purrose, a quantity of ether, in this case the nose being the organ used in the hunt, the fitter careful y going over the pipes, smelling for the ether that will escape from the leak. This method of finding a leak in an open building is somewhat uncertain and tedious, but is frequently used with auccess.

If the gas service is in and permission from the gas company be had, service and house main can be connected and the nose may be assisted by a lighted taper in the search. If the lighted taper is employed great care must be exercised to guard against setting the building on fire, as the very small flame likely to result from a little leak may not be perceptible to the eye, especially in the daylight. Or the flame may be at the back of a fitting in some inaccessible place, beyond the reach of eyesight. It is a good rule to test with a light in no place that cannot be easily reached to blow out any flame that may result, and further, when there is a strong odor of gas a light must never be put into confined places, such as between floors or behind partitions. This especially applies to searches for leaks in finished buildings, for by so doing the fitter may have an explosion added

to his troubles.

Sometimes it is possible to fill the pipes with water and locate the leak in that way. This is a risky business, however, as it is very difficult to empty out all the water, especially from the smaller pipes, and may cause trouble for months. The writer, nevertheless, has known fitters who did not hesitate a mement in adopting this plan, it being a certain and rapid way of finding leaks. When following this plan, however, the proper way to empty the pipes of water is to take off the caps on the nipples and drops that are highest. Then remove the caps on the lowest drops and nipples and on the main, blowing violently several times into each nipple on the upper or top flat. Then take the caps off the next lower flat and blow into all the pipes on that floor and so on down, keeping at it until there is so uncertainty as to the pipes heing entirely emptied of water. They can then be left for a few days and the blowing out process repeated. This method of finding leaks is, of course, out of the question in cold weather.

In fitting up large buildings it is a safe plan to test the work in sections—say a flat or two at a time—leaving suitable connections for joining all the parts tested before making the final test of the whole job. Having found the leak, there comes up for consideration the question of making effectual repairs. A split pipe or fitting must be removed and replaced with sound material, but a small hole in a fitting may be closed with gas fitters' cement, the fitting being first well heated by means of the blow pipe and lamp and the cement applied to the attachment while hot. An escape at the screw thread may also be firmly closed with cement or with red lead well rubbed in.

### Hardware Curios.

The accompanying illustrations represent some of the old time Hardware in the possession of H. C. Wiseman of the Springfield Hard-

The old time Pocket Knife shown in Fig. 2 measures 61/2 inches in length with the blade open, and has seen

# TIN PLATES.

Delay in Tin Plate Delivery, 1

Tin plate importing and jobbing houses at the present time are being inundated with telegrams and letters from impatient customers asking the reason why their orders are not promptly shipped. It may, therefore, be opportune to point out to consumers that the nearer October 1 is approached the fewer boxes of tin and terne plates will be found in stock, duty paid, as houses holding plates in bond cannot be expected, under existing conditions, to withdraw them, except in cases where they are actually ordered. It then takes two or three days, and sometimes longer, to put entries through the Custom House, owing to the pressure of business in that department. Consequently, purchasers needing plates in a hurry and expecting to get them at once are liable to disappointment. Consumers would do well to note these facts and order beforehand, accord-

### A Welsh Tin Plate Worker's Views.

President L. Richards of the Welsh Tin Plate Workers' Union is quoted in an English exchange as saying that the British manufacturers should accept the 36 box rule so as to prevent the market being glutted. This, he estimates, would yield 14,400,000 boxes a year, or 2,500,000 more than the exports in 1891, the year before the McKinley tariff came into operation. Some mastera have already adopted the rule, but others decline to do so, because they want he saws to carry on a cut threat want, he says, to carry on a cut-throat competition. Though the reduction of the tariff will, in his opinion, lead to an advance of 1 shilling per box, they will lose in other ways the advantage thus gained. The revolution in the oil trade must injuriously affect them. Oil had hitherto been carried in tins, but now tank steamers are beginning to carry it in bulk. This, he says, will make a difference of 1,000,000 boxes a year in the Russian trade alone, and another 2,000,000 boxes in the American trade. This loss, however, might be recovered if they could only get tea from China and Ceylon carried in chests made of tin and lead instead of in wooden cheats, as at present.

### SCRAP.

An erroneous notion has got abroad that in a recent article referring to the difficulties in the way of the smaller dipping concerns under the new tin plate tariff we intimated that the future of the American tin plate industry was exceedingly dark. Lest this impression should gain further credence, we wish to state very plainly that our remarks were confined to the smaller works who are severely handicapped by the new duties on black sheets and tin plates. As a matter of fact, many of these smaller works have closed, and their proprietors express little hope of reopening unless advantageous arrangements and arith domestic bleek opening unless advantageous arrange-ments can be made with domestic black sheet mills. The larger firms, on the

other hand, who have established trades other hand, who have established trades in their specialties, are, as we have previously stated, in a much better position. The lower duty on tin plate is in a measure prejudicial to the American industry, but there is not the slightest prospect that the tin plate trade which is now established here will ever be recovered by Wales.

A MERTING of the Tinned Plate Manufacturera' Association of the United States was held in Plttsburgh, Wedneaday of this week, for the purpose of discussing what reduction in wages will be necessary on account of the lowering of the tariff on tin plates. The Wednesday meeting was preliminary to a conference held at Pittaburgh on Thursday between the Executive Committee of the Tinned Plate Manufacturers' Association and a committee of the Amalgamated Association. It was not ex pected that any immediate agreement would be reached, as the question of what changes have been made in the aelling prices of tin plates under the lower duty had to be exhaustively gone into, and would require considerable We understand that the tin plate manufacturers and also those concerns making sheets for tinning purposes were going to insist on a reduction in wages, and this would likely be opposed by the workmen. It is the opinion of those who are familiar with the situation that a slight reduction at least in the present wages in tin plate mills will be effected.

WE ARE ADVISED that the tin plate works of N. & G. Taylor Company, Philadelphia, are running full, with a good volume of ordera, particularly for their apecial brands of roofing plates. Another tinning pot has been recently added, making the present equipment

WE HAVE BEEN FAVORED by the Record Mig. Company, Conneaut, Ashtabula County, Ohio, with some excel-lent specimens of IC, 20 x 20 bright coke tin plates made at their works. The plates are made of American steel, and the coating is smoothly and evenly distributed, giving the plate a hand-some appearance which is enhanced by a brilliant polish imparted to them by the Record patent cleaning and polishing machine now in use at the firm'a works. There is no trace of the rubbing or scratching which so often marred the bright plates treated under the old manual system.

GERMANY exported last year 2693 tons more of tin plate than she did in

In its remarks on the new tariff the London Ironmonger says that while British manufacturers of tip plates will be assisted by the new rates their hold on the American market will never be what it was formerly.

One of the most attractive exhibits in the County Fair held last week in New Castle, Pa., was that made by the New Castle Steel & Tin Plate Company, consisting of steel billets, tin bars,

plates made by the firm. Fruit cans, cups, coffee pots and other objects manufactured from "New Castle" plates added to the display and demonstrated the excellent character of the home made product. The display, which attracted considerable attention, was arranged by Bert Greer, a boy 17 years of age.

THE IRONDALE STERL & IRON COM-PANY of Middletown, Ind., started their new rolling mill on the 31st ult. They will manufacture tin plate, beginning with the steel billet. The starting of the plant was made the occasion of much rejoicing among the manufacturers and other citizens of Indiana, who gathered at the works.

Exolish Cable ADVICES indlcate that some of the idle Welsh tin plate works are starting up again on the atrength of the new American tariff. Among those which have gone into operation this week are the plants of the Burry Iron & Tin Plate Company of Llanelly, with six mills, and the Gorseinon Works of Wm. Lewis & Sons, Gorseinon, near Swansea, also having a six-mill capacity.

THE ELLWOOD TIN PLATE COMPANY, Ellwood City, Pa., manufacturers of tin and terne plates, have recently let a contract for a new tinning house which will measure 50 x 100 feet in size, and contain ten tinning stacks In addition to this building the firm will put up an assorting room and pickling room in two separate buildings of about 30 x 40 feet in size. The firm have placed orders for two Morewood tinning sets with the Lloyd Booth Company of Youngstown, Ohio, and two Thomas & White sets with the Union Foundry & Machine Company of Pittsburgh, with which four machines it is their intention to make a start coating their preduct of to make a start coating their product of black sheets, while they will gradually equip their tlnning house to its full capacity as soon as conditions warrant this step being taken.

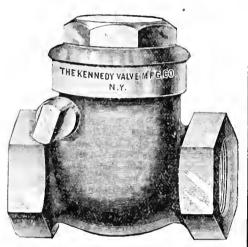

A GOOD INDICATION of gradual improvement in the metal trade is the satisfactory character of collections. A member of one of the largest tin plate and metal jobbing houses in this city said, a day or two ago, that payments had never been more prompt than at the present moment. It seems that country dealers and consumers have been putting their money into the banks during the past year instead of into atock. Consequently, they are now in the most favorable position— Consequently, they are having little or no stock—to create an active fall demand for all lines of metal products. The authority quoted is of opinion that things are decidedly shaping toward an excellent business for the last quarter of the year.

Forest fires, caused by the heat and drought, have devastated large tracts in Northern Michigan and Wisconsin. The losses to the lumbermen aggregate many millions of dollars. Several towns and villages have been completely wiped out, and much suffering is felt by the

# STEAM AND HOT WATER.

### Kennedy Straightway Swinging Check Valves.

Fig. 1 of the accompanying illustrations shows a general view and Fig. 2 a sectional view of the straightway swinging check valves brought out by the Kennedy Valve Mfg. Company, 52 Cliff street, New York. A special feature of these valves, to which the manufacturers allude, is that the disks

Kennedy Straightway Swinging Check Valve.—Fig. 1.—General View of Valve.

in both the brass and iron valves rotate and are so constructed that they cannot become inoperative by sticking fast in the body of the valve when in use. The boxes in which the disks hinge are made of the best bronze. The valves are made with either screwed, flanged. or bell ends, and with brass, rubber or leather disks, as required, and those above 8 inches are furnished with a bypass

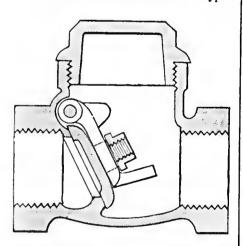

Fig. 2.-Sectional View of Valve.

when desired. The general features of the valve are shown in the sectional illustration. The brass valves are made in ten sizes, from 1 to 3 inches, while the iron valves are made in 13 sizes, from 2 to 16 inches.

week on his way to his home in Balti-more where he will spend a few days. Mr. Wilson reports a good trade in his line in the New England States and hopes to find business equally active in the Middle States, which he will visit after leaving Baltimore.

### Professor Jacob on Ventilation.

In a recent address before the Yorkshire Engineering Society, England, Professor Jocob declared that six parts of carbonic acid gas in 10,000 in an atmosphere are not obnexious, but 12 parts give rise to objectionable odor, and as the greater part of the air of a room in supposed circulation is really stagnant-this stagnation very commonly extending beyond the limits of the breathing line—the admission of cold air at the base of the walls, with exit from the ceiling line, does not necessarily ventilate the room. In record to the propulsion and systim are gard to the propulsion and suction systems, he remarks that there are objections to the long air passages of the former, that the useful area of such passages may be considerably reduced by sharp bends, and in pipes with elbows at right angles the reduction of available area is as much as 25 per cent. For efficient means of ventilating and heating, Professor Jacob urges that heating radiators should be so arranged that the incoming cold air can be drawn over the radiators if necessary, or deflected partly over the coils or not at all; it is better also to arrange the heating coils in sections, so that part can be cut off from the heating supply. Thus, if the temperature of the air on passing over the coils be greater than that of the air in the room it will rise, and in order to promote its circulation it is to be drawn from the base of the wall opposite which it enters; if colder, then other-

### Summer Testing for Winter Heating.

From L. A. N. & Co., New York.— In The Metal Worker of August 18 a correspondent requested information relative to the summer testing of heating plants with a view to determine their capacities for winter heating. It appears to us that the determination of the question whether a heating plant will warm a building in which it has been erected to a specified temperature in cold weather, involves something more than a test of the apparatus put in for that purpose; so that if a test of the apparatus in summer could be made which would entirely determine the tightness of its joints, the positiveness and freedom of its circulation, and its capacity to generate and distribute heat to all parts of the structure, the question whether, under the conditions of temperature named in the guarantee, it would heat the building to the re-quired temperature would, in the ab-sence of accurate knowledge of the J. J. Wilson, heating engineer, with the Fuller & Warren Company, Troy, N. Y., passed through New York this the winter season had established the

conditions under which the apparatus is stipulated to produce a given effect. Since heat transmission depends upon temperature differences, such differences csnnot be artificially established be-tween the interior and exterior of a building in summer as will be naturally set up in cold weather. Nevertheless, a contractor may satisfy himself in summer that, if the building has been well constructed, the heating apparatus placed in it is sufficient to fulfill the piaced in it is sunicient to idinity the terms of his guarantee. To entertain grave doubt on this point with reference to all heating work done in summer would entail a losd of anxiety too great for endurance in any business. The chief difficulty lies in satisfying the owner that the plant will fill the bill. The result is that final payments on summer jobs are delayed, and it is often six months, or even more, before the desired weather which will prove beyond question the sufficiency or deficiency of the apparatus enables the contractor to press for the enablea the contractor to press for the collection of the final payment. The whole difficulty relating to the determination of guaranteed efficiency of heating apparatus, so far as it affects the question of final settlements, would have been engaged. disappear if, as has already been aug-geated in The Metal Worker, owners were compelled to take their fair share of the risk. The contractor should only be required to guarantee his apparatus to have the proper capacity for a well constructed building of the kind and size of that in which the apparatus is to be placed; then he may, if skillful in this kind of work, plan and construct a heating plant in such a manner as to he reasonably sure of success in filling his guarantee. If the failure of a heating plant, otherwise ample, results from bad building, surely the contractor ought not to suffer for the sins of either builder or owner.

### HEATING NOTES.

COL. WILLIAM C. MOWRY of Norwich. of steam heating fame, and known to every plumber in the State, is in the field for political preferment, says the New Haven Weekly Record. Colonel Mowry is spoken of as a promising candidate of the State State of the State of didate for State Secretary.

THE MARYLAND STATE LAW probibiting the use of stoves in passenger cars having become operative, the Baltimore & Ohio Railroad Company have awarded a contract for fitting up 500 of their passenger cars with steam heat.

THE WALWORTH CONSTRUCTION AND SUPPLY COMPANY, Boston, Mass., on September 1 removed to larger quarters, at 100 Pearl street, corner of High streat.

Secretary Carlisle has reversed his first ruling in regard to the admittance of bonded goods placed on the free list of the new tariff law, by which ruling such goods would have either to pay the McKinley duty or be exported and reimported. He now directs that these goods be admitted duty free, although placed in bond previous to the enactment of the new law.

### Cold Air Regulator.

A device of interest to the furnace and heating trades is a cold air regulator manufactured by C. W. Richards, 90 Euclid avenue, Cleveland, Ohio. The general features of the regulator are shown in the accompanying cut, which illustrates the device adapted to govern the sir supply. The regulator is located in the cold sir box, and consists of a frame the same size as the window that admits the cold air. This frame, as shown in the engraving, is divided into a series of openings by ver-tical bars. In these openings are a series of outer and inner balanced valves made of iron and having brass bearings and awinging on brass rods. They are nicely balanced, and the outer ones close more or less according to the force of the wind, thus reducing the supply to the cold air box. The instant, however, that there is a lull in the wind they open automatically and supply more sir to the furnace or heater. The inner ones, by a reverse placed in a duplicate machine, and the compositor puts the tubes to his ears and sets in type what he hears. If the machine talks too fast he can stop it.

#### FLASHINGS.

THE KANSAS CITY METAL ROOFING & CORRUGATING COMPANY, Kansas City, Mo., report a very satisfactory trade. Their July business was more than double the corresponding month of last year, and August showed equally good results. Among the orders recently secured by them for corrugated iron roofing and siding they mention the following: Rex Milling Company, Arms & Kldder Milling Company, and the Kansas City Car & Foundry Company, and, in addition to these, shipments have also been made to points in Missouri, Kansas, Oklahoma and Indian Territory.

THE GARRY IRON ROOFING COMPANY, Cleveland, Ohio, have secured large contracts from the United Salt Com-

columns, the Youngstown Iron & Steel Roofing Company, Youngstown, Ohio, have been organized as a stock company under the laws of the State of Ohio, with the following efficials: L. E Cochran, president; G. M. McKelvey, vice president; C. S. Pew, secretary; Mason Evans, treasurer, and John O. Pew, general manager. concern have now under construction suitable buildings for the manufacture of a full line of metal rooting of all kinds and styles, metal siding and ceiling, and when completed it will be one of the best equipped works of the kind in the country. The new plant is so located that there will be direct connection with four of the main trunk lines running East and West, these being Lake Shore & Michigan Southern, New York, Pennsylvania & Ohio, Pennsylvania and Baltimore & Ohio. It is proposed to manufacture the John O. Pew patent standing seam steel and iron roofing, the fastener used being one for which a patent was recently granted to John O. Pew and for which many points of excellence are claimed.

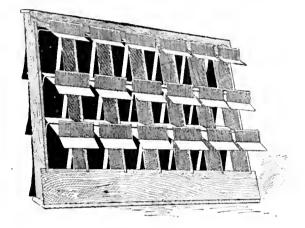

As ALREADY ANNOUNCED in these

A LARGE SLATE DEPOSIT, says the Tradesman, located 40 miles from Knoxville, Tenn., has recently been discovered and examined with gratifying results. The property is owned by Maurice and Ida Hoskins and the deposit is of the best roofing slate, both sky blue and sea green, and does not change color or quality after exposure.

Transatlantic record breaking has set in with great severity. Two weeks ago the Cunard steamship "Campania" broke the westward record by three hours, and on her eastward voyage last week the same vessel accomplished the passage from Sandy Hook to Qucenstown in 1 hour 13 minutes less than the previous best time—her own—making the eastward record 5 days, 12 hours, 7 minutes. On Friday last her sleter vessel, the "Lucania," arrived in New York in 5 days, 8 hours, 35 minutes from Qucenstown, thus snatching the westward record from the "Campania" and making another step toward the predicted five days' voyage.

Andrew Carnegie has an article in the September Contemporary Review on labor in America, in which he says that the workingman can live for less in the United States if he chooses than in Grest Britain, provided that he will live as frugally. A pound expended judiciously here would, he thinks, afford the workingman's family more comfort than would the same amount spent in England. Consequently Mr. Carnegic concludes that the argument that wages must be higher in America is fallacious.

Orders have been received at the Brooklyn Navy Yard that the new engines for the "Chleago" are to be built there. The yard presents just now a scene of unusual activity. The docks are full of ships, and all the departments are busy. Among the commissioned vessels now undergoing repairs or overhauling are the "New York," the "San Francisco," the "Cincinnati," the "Vesuvius," the "Bancroft" and the "Dolphin." In addition, the "Maine," the "Laneaster," the "Machias," the "Castine," the "Puritao" and the "Terror" are preparing for commission.

Cold Air Regulator.

action, close the instant there is a tendency to an outflow of hot air through the cold air box. Those who are familiar with the curious behavior of furnaces during windy weather will understand the advantage of a regulator of this sort.

The Philadelphia Ledger says that in Russis the bishops are beginning to have their miters made of aluminum. This takes a load off their heads, as the ordinary miter weighs five or six pounds and a metal one only one pound or so.

Pacific Coast journals chronicle a sensible improvement in local trade during the present month. The San Francisco Bulletin mentions the fact that eight wheat cargoes had been cleared from that port during the first half of the present month, against only one in July, one in June and four in Msy, while 11 ships were in port under engagement to take grain and canned goods to Europe. Altogether, the prospects are regarded as favorable for a satisfactory revival of the export trade of the port.

An entirely new departure in printing has been taken by the Pall Mall Magazine of London. The printers of that periodical are making use of the phonograph in place of the usual "copy." The cylinder is removed after an article has been spoken into the machine and sent to the printing office, where it is

pany of Cleveland to erect iron structures at their works which were recently burned down. The buildings are to be constructed entirely of iron.

THE DEMAND for the metallic Spanish tiles made by Merchant & Co., Incorporated, of Philsdelphia, has grown to such proportions that the firm sre now preparing plans for the erection of a new building in connection with their tin plste and smelting works, to be devoted to the manufacture of these articles. The tiles have been highly recommended by leading srchitects and builders. Three hundred and sixty squares were recently shipped to Denver, Col., for the roof of the new Union Depot in that city.

THE USE of galvanized sheet iron is increasing in Java, judging by the returns of exports of that material from Great Britain. In 1890 they were of the value of \$93,600, but in 1893 they had increased to \$155,700.

THE KANSAS CITY METAL ROOFING AND CORRUGATING COMPANY, Kansas City, Mo., are sending out to the trade a return postal card solielting inquiries for the lines which they carry. The return portion of the card enables the prospective customer to state quantity and kind of goods wanted and for what purpose the material is to be used. The postal eard slso contains a list of materials which this firm carry in stock, and the points emphasized are "best goods, lowest prices and quickest delivery."

### The Keating Pipe Yard.

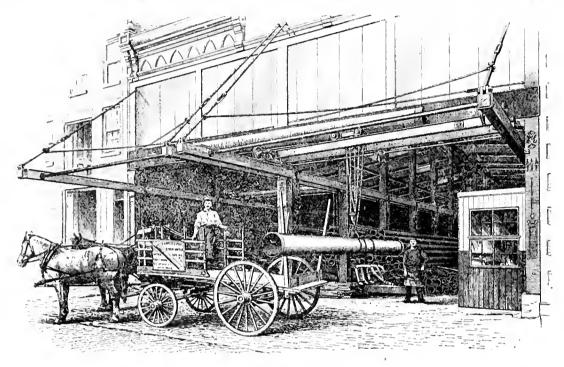

The pipe yard of Edward F. Keating, at 435-437 Water street, New York, is admirably arranged for the convenient storing and the quick and easy delivery of pipe of all sizes. One man can, unaided, raise without trouble and load upon the truck a length of the heaviest pipe, weighing 1200 pounds. The building is 120 feet deep by 40 feet front. It is divided into two compartments by a center row of heavy wooden

capacity. Each can be handled by one man, even when loaded to its full capacity.

## Elghi-Foot Automatic Self Opening Rolls.

We show in the accompanying illustration automatic self opening rolls, 8 feet in length, which are put on the market by Bertsch & Co., Cambridge City, Ind. The operation of opening

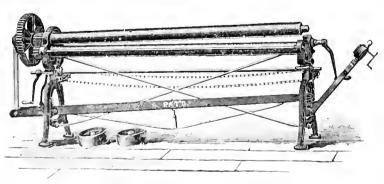

from end to end with ease. The lower roll is self adjusting and need not be altered every tims after bending the plate, unless the plate to be formed is either a thicker or thinner one, in which case the lower roll is adjusted as desired at both ends. The rolls are provided with Messrs. Bertsch & Co.'s improved quick adjustment on the back roll. This attachment is a link belt chain and sprocket wheel on adjusting serews, one or both ends of the back roll being thus adjusted quickly and accurately at one

The Keating Pipe Yard.

columns. One side is used for the storage of small or bundle pipe and the other for piece or large pipe. Running down each room is a hand traveling crane carried on light rails placed on wooden stringers supported by the center row of columns and the side walls. These tracks extend beyond the front of the building, to which their outer ends are secured by turnbuckle rods, as shown in the engraving. The ends of the tracks are in line with the curbstone, so that it is necessary for the truck to obstruct only a small part

the rolls, as shown, can be done by one man in a few seconds, a single operation almost instantaneously disengaging the bearing buckle, which, when removed and turned back from the top roll journal, will at the same time elevate and support the top roll. It also at the same time lowers the opposite end of the lower feed roll to release a wide plate at the opposite side. The attached bar beneath, the two front rolls, the bearing buckle alluded to and the attached bar are operated conjointly when opening or closing the bearing buckle.

Eight-Foot Automatic Self Opening Rotts.

of the sidewalk in order to be reached by the crane. The ends of the tracks are supported against side movement by the diagonal tie rods shown. The front of the building is closed by vertically sliding doors which pass through openings in the stringers. The gap thus made in each rail is closed by a small acction of rail when the crane is in operation. Each crane is of 2 tons The opposite end of the lower feed roll has its journal box and adjusting support connected to the opening bar, and therefore the weight of the lower roll at the opposite end will ald in elevating the top roll and help it support it when the formed metal is removed. The construction of the machine furthermore is such that the two feed rolls are in a manner balanced and free to open

time. For cone or tapering work one end of the roll can be adjusted at any angle by inserting a tapering wedge under the journal box.

### Smoke Consumption.

According to Engineering of London no appreciable economy is likely to be effected by smoke consuming devieta. The assumption that smoke contains a large proportion of combustible monocoride has been disproved by analyses of furnace gasts, and the calorific value of the hydro-carbons in ordinary coal is only a small part of the total. Furthermore, heavy smoke contains only 51 grains of soot per 100 cubic feet, and spot contains only 60 per cent. of combustible materials. The demonstration of the commercial inutility of smoke, however, will not affect the agitation for the abatement of the smoke nuisance in large cities upon esthetic and hygienic grounds.

The Allegheny Board of School Controllers have authorized the establishment of manual training schools in Pittsburgh. The Controllers will furnish the teachers and the Ward Boards will supply the necessary buildings.

An ordinance has been introduced in the Common Council of Reading, Pa., which provides that each and every person who shall throw "a banana peel or peels upon any of the sidewalks or street crossings shall, for each and every offense, be liable to a fine or penalty of not less than \$3 and not more than \$10."

### THE RETAIL STORE

### Dangler Combination Radiator Heater.

In the accompanying illustration we present a general view of what is known as the No. 308 Dangler combination radiator heater, which is being intro-

desired; large air circulating eapaeity and nickel plated and polished side and front ralls. Top, base and middle rings are features to which the manufacturers allude. The oil tank is of heavy spun brass, and is easily removed by means of rings which are provided with which

Dangler Combination Radiator Heater.

duced to the trade by the Dangler Stove | & Mfg. Company of Cleveland, Ohio. The heater is of attractive finish, some of the parts being nickeled and forming with the black surfaces of the radiating tubes a pleasing contrast of light and shade. A 6 inch burner rests on a highly polished copper reflector. The radiator is composed of ten tubes, placed as shown in the engraving. Asbestos is used for lining purposes, and it is claimed that the air in passing through the doors on each side of the device gives satisfactory combustion and results in the radiation of intense heat. The radiator is made either plain or nickel finish as may be desired.

### Perfection Oll Heater.

An oil heater possessing a number of interesting features of construction and made under the name Perfection is being offered the trade by I. B. Kinne & Son, 208 Nicollet avenue, Minneapolis, Minn. The stove is mounted on casters, has removable top, making room for a vessel in which to heat water if

to lift it. It has a flat bottom and can be set in any convenient place for filling,

Perfection Oil Heater. - Fig. 1.-Top Turned Back for Lighting or Removing Oil Tank.

adjustment is such that the wick is raised evenly all around. Fig. 1 of the illustrations represents the Perfection oil heater with the top turned back for lighting or removing the oll tank. also shows the bottom of the circulating tubes, which draw the cold air from the those, which draw the cold an from the floor around the oil tank up into the heating drum. The large amount of cold air passing around the oil tank, it is noted, keeps the latter cool and reduces danger to a minimum. Fig. 2 of the illustrations shows the heater with a portion of the outside shell removed exposing the air tubes and central heating chamber. The makers state that the drum has 1624 square inches of radiatiou. There are 19 steel tubes 11 inches

Fig. 2.—Heater with Shell Removed, Showing Air Tubes and Central Heating Chamber.

In diameter drawing air from the floor and diacharging it in a highly heated condition into the room. The manufacturers refer to the economical consumption of oil. It is stated that the device will heat a room 15 feet square in the coldest weather.

### Fishing Tackle.

A Western retailer thus writes in regard to the desirability of Fishing Tackle being handled by Hardware merchants, and at the same time refers to some of the features of this class of trade:

I am surprised that so few retail Hardware dealers make a purh on Fishing Tackle. There is a disposition to leave this branch to the gunsmith, but

The time was, and not so very long ago; when an ordinary stock of Tackle for a retail store consisted of a few cheap lines, a few boxes of common hooks, some sinkers and floats.

that ran up to \$5 was a very good one. But the growth of the idea of sum-mer vacations and the greater interest taken in all outdoor recreations have led to the increase of fishing to a won-derful degree and has made Tackle an important item.

Twenty five years ago the man with a jointed rod was a rarity, now the very smallest boy has to have one. The cleaning, trimming wick, &c. The capacity of the tank is about 5 quarts. The manner and kinds of artificial baits. Nothing in hooks used to be known but a Limerick, but new the young fellow talks about Carlisle, Sproat and Cincinnati Bass, hooks with the same air that he discussed the best brand of

chewing gum.
Prices in what used to be luxuries (Rods and Reels) have dropped down faster than almost any item in our line. The factories sell a three-piece ash rod

### The Gem Stove Truck.

A new form of stove truck is being introduced to the trade under the name of Gem, by Charles F. Fox of Dayton, Ohio. The manufacturer refers to the device as overcoming all the objections common to wood platforms, this being made entirely of iron and in compact cuts. Fig. 1 shows the pipe nested tocuts. Fig. 1 snows the paper and gether for handling and Fig. 2 shows a gether for handling and Fig. 2 shows a gether for use. The special single joint ready for use. The special merits claimed for this pipe are convenience in handling, absolutely tight lock joint and simplicity of adjusting seam.

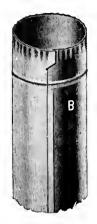

Fig. 2.—Single Joint of Pipe.

The pipe is put up in crates of 50 joints each, and being nested in crates it is pointed out that a low freight rate is The pipe is made of cold secured. rolled smooth steel and also of common surface iron.

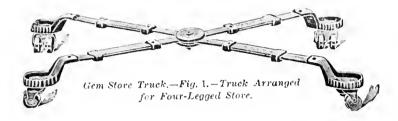

### The Parlor Dome Oil Heater.

One of the unique oil heaters of this year is shown in accompanying picture of the Parlor Dome, brought out by the Central Ollgas Stove Company. In appearance it is ornamental, and every convenience is provided to render its

The Parlor Dome Oil Heater.

use agreeable. Resting on an attractive ateel tray with casters it is readily moved where desired. The body has a graceful swell from the four supports to point where foot resta are secured. From this point it recedes as it raises to the dome support, which extends directly to a large diameter to receive the dome. The dome, with perforations in its surface, rises to a handsome urn at the top. The entire heater is made of cast iron and a very pretty effect is gained by the decoration and when lit a soft, warm light is spread through the perforations in the dome. Addi-

for 75 cents per dozen. The result of this has been to about kill our trade in Japanese and Calcutta bamboo poles. The result of We buy a plain Reel at 60 cents per dozen. None of us imagined ten years ago that we would see prices touch these figures—a jointed Rod and Reel to cost us 11 cents.

Lines have dropped in proportion, so that we can sell a braided Line for a

nickel.

In the matter of artificial baits prices are also phenomenally low. We buy a good plated Spoon Hook with fly at 5 cents. Rubber Minnows are down to 22 cents.

form. It has no clamps, yokes or thumb screws to get out of order. Its construction is such as to permit of ready adjustment to all sizes of stoves. One of the special features of construction claimed in this device is that it accommodates itself to all forms of fourlegged stoves as well as to those which have but three. It is stated that one man can mount any ordinary size stove with ease. Fig. 1 of the illustrations shows the truck arranged for a four-legged stove, while Fig. 2 shows the manner in which it can be employed for a three-legged stove. The truck is

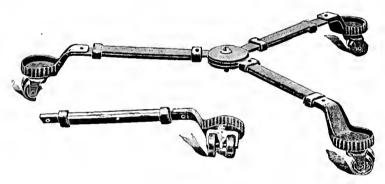

Fig. 2.—Truck Arranged for Three-Legged Stove.

Now, with these low costs, and the spirit among men and boys to have good tackle, there is nothing in a Hardware store that will better pay for the

ware store that will better pay for the work put into it than this line.

The person who is going fishing wants to catch some fish. He knows that fish are creatures of whin and fancy. What they eagerly bit at yesterday they will not touch to-morrow. Consequently it is comparatively easy to coax a man who is going fishing into trying a wider variety of baits into trying a wider variety of baits than he intended, and it will be still easier to do this the next time he calls, for he will see others catching more fish than he succeeds in capturing, and ten chances to one he gives all the credit to the particular hook or bait they used.

It is a pleasant business. It is at its best in the hot summer months when other branches are dull. The fisher-men of the town include the very nicest people there, and they are pleasant customers to trade with. Above ant customers to trade with. Above and beyond this is the fact that it pays,

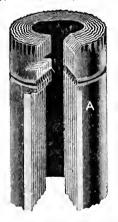

and beyond this is the fact that it pays, and pays handsomely.

If stock is carried over it is just as salable a year from now, and the judicious buyer will remember that it is easy to replenish, and need not invest very heavily at the start. The trade belongs to the Hardware line. If you are not "in it" you are making a mistake.

compact, requiring very little apace for storage, and is shipped in cases of four

### Columbia Nested Stove Pipe.

The Columbia Corrngating Mfg. Company, Niles, Ohio, are offering to

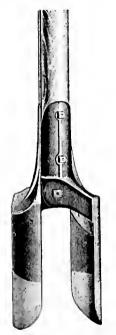

Columbia Nested Store Pipe.-Fig. 1 .-Pipe in Nested Form.

the trade the Columbia nested stove pipe of their manufacture, views of which are shown in the accompanying tional ornamentation is accured by the use of nickel, japan and gilt. It is made in three sizes, with a tlame of 10, 12 and 15 inches respectively. The dome is secured to the body by a hinge and when turned back the burner and tank can be readily removed for attention. The burner is of the central draft type, so made as to effect, it is claimed, an odorless combustion and a great heating capacity. A heavy seamless drawn steel tank is used that is retinned, and the device for adjusting the wick renders the care of the heater free from annoyance. A new circular of the heater is being sent out that leaves none of its features unnoticed.

### The Canton Post Hole Digger.

Gibbs Mfg. Company, Canton, Ohio, are putting on the market a post hole digger as here shown. The handles

The Canton Post Hole Digger.

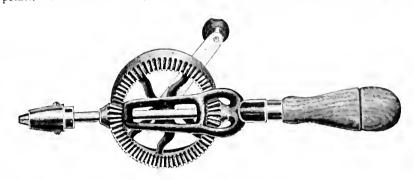

open past each other, bringing the strain on the thick way or edge of the handle, instead of apart and on the broad or thin way, thus giving, it is explained, increased strength to the handles. The shanks above the blades are round in form to fit the handles and permits them to be firmly fastened with 15-inch bolts, and to be kept tight in case of shrink age. A shoulder is provided at the bottom of the handles to receive the full thrust instead of allowing it to come on The hinge bolt is of steel the bolts. and is provided with a jam nut to prevent it coming loose, also to take up all wear perfectly. The length of the steel blade is 9 inches; the length of the entire digger is 5 feet 3 inches and the weight 9 pounds each. The manufacturers remark that all the materials used in the construction of the tool are of good size and of strength to withstand the required work, and that although the digger was designed to meet the prevailing tone of low prices the finish will be kept up to their usual good standard.

### Hand Drill No. 5.

Millers Falls Cempany, 93 Reade street, New York, are putting on the market the hand drill here shown. The drill is offered as a substitute for drills Nos. 1 B, 3 and 3 B, and has, it is claimed, all of the advantages of the

other numbers mentioned, and In addition has a wide rimmed gear to be grasped between the thumb and fingers when the drill is used for deheate work. It is stated that in this manner it can be run without liability of breaking points. The drill is double geared, 111

C the metal door jamb, D the inner tire proof rlm, and E the fireproofing around the inner case. The materials used are high grade, cold rolled and pickled steel, and the best non heat-conducting substances. The boxes are of such shape and size that they can be

Hand Drill No. 5.

inches in length, weighing 20 ounces, and is accompanied by six points of the same style as are put up with their automatic borers. The drill has the advantage over No. 3 B of being listed at a less price. The manufacturers state that they shall discontinue the making of the three numbers referred to, and that when their present stock on hand is exhausted the No. 5 drill will be substituted without notice.

### Steel Fire Proof Security Boxes.

The Sidway Mfg. Company, 32 to 40 South Jeff-reon street, Chicage, are manufacturing a steel fire proof security box which is specially adapted for use in private residences. Safes or other receptacles for protecting valuables, documents, jewelry, &c., from fire are seldom found in residences on account of their cost, size and weight. It is claimed that these objections have been overcome in the construction of the Sidway box, after over a year's experimenting. The illustration herewith given shows its form. The outside length is 17½ inches, and the width and hight are each 11 inches. Its inside length is 10½ inchea, width 5½ inches and hight 6 inches. The weight is 55 pounds. In the construction of these

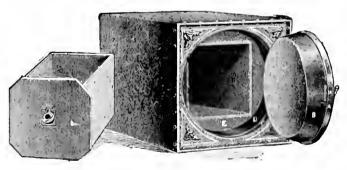

hidden on a shelf, in a trunk, or in a closet or some other convenient place. The company issue a descriptive pamphlet which gives a report of a severe test of the fire proof quality of one of these boxes which was successfully endured.

### MEMORANDA.

A. O. Young has disposed of his stoves and hardware business at Nebo, Ark., to Young & Webb.

THE STOVE AND HARDWARE BUSINESS of G. W. Carson & Co., Beaver, Ark., has been purchased by M. W. Swoope.

WM. G. CREAMER & Co., 96 John street, New York, are bringing out some new sizes and designs of hot air registers for fall trade. A feature of the register will be the arrangement of the regulating lever, which works easily and holds the valve in any desired position. They are adapted for use in the floor or side wall and as ventilating registers. Their Novelty, Convex and Keystone are specially suited for side walls and partition flues, as the face extends out into the room and the valves work outside of the flue, so that there is no frame extending into it to obstruct the air current. The valves are fastened to the face and as the face is bolted to the frame it is not necessary

Steel Fire Proof Security Boxes.

boxes a different principle is pursued from that followed in making the atandard safes. Instead of having the door composed entirely of metal and closing against the metal edges of the frame, thus forming a continuous metallic connection which is of course the best conductor of heat, these boxes have a space between the metal edge of the door and frame filled with fireproofing. Referring to the lettering on the cut, A is the metal door frame, B the fire proof back,

to set the whole register in a new building where they are liable to be broken or soiled.

A St. Louis special reports that the right of way has been purchased for a new belt line road, to be known as the St. Clair, Madison & St. Louis Belt Railway. The road is to run within a radius of 25 miles of St. Louis. The work of laying the tracts in Missouri will be begun at once.

# STOVE TRADE NOTES.

### The Chicago Stove Trade.

Quite an agreeable change can be reported in the character of the Chicago stove trade. In July and the early portion of August prospects were gloomy. The most depressing stories were in circulation regarding the condition of crops yet unharvested. A long period of drought had discouraged farmers, and to crown their misery hot winds blew over the fields for days, apparently deatroying all vegetation in a large part of the West. Farmers are proverbial pessimists, and their wails alarmed all who were brought in contact with them, and especially those who depended upon their patronage. It is, therefore, easily understood now how merchants became in a sense panicatricken and in many instances countermanded orders which they had placed for atoves for fall delivery. Ruined communities might need stoves, but there would be no money to pay for them. Hence it appeared to be wise to keep down stocks of goods and curtail sales rather than extend credits to the danger point and invite bankruptey. But as time wore on it was perceived that the reports of crop failures were exaggerated. Only Weatern Kansas and Nebraska were found to be in really serious condition. Other localities had resources which saved them from total impoverishment. quently a reaction act in during August which brought about the more healthy condition of trade now existing.

It can be said at this time that the volume of business is fully up to that of last year. Some houses report a slight increase as compared with their sales up to September 1, 1893. Not only are orders coming in quite encouragingly, but in noteworthy instances merchants have requested their countermanda to be reinstated. They report that an improved feeling is discernible among their former patrons, now that they find they have not been irretrievably ruined by the failure of only a portion of their crops. Higher prices for what they have raised will be partlal compensation, and of this they are assured. It is further found that Amerlcan farmers are by no means altogether dependent upon the crops of one season. Most of them are forehanded and have accumulated more or less from the results of their labors in previous years when they were treated more considerately by Dame Nature.

The remarks above made regarding the betterment of trade are of course comparative. The stove business is

still far from being in satisfactory shape. Foundries are, with rare exceptions, not running on full time, although this should be the busiest season of the whole year. A heavy increase could be made in the volume of business moving without causing serious inconvenience. But considering in how much better shape the Western atove trade finds itself than was anticipated only a month since, there is cause for rejoicing and not replning. If the season of 1894 winds up better than had been expected, all hands will enter upon the campaign of 1895 with increased hopefulness and renewed vigor.

## Buck's Stove & Range Company's Reception.

Buck's Stove & Range Company, St. Louis, Mo., were the recipients of a complimentary visit on Tuesday afternoon, 28th ult., by a large number of their city customers. This company have for some years past been enlarging and improving their plant until to day its capacity is more than double what it was four years ago. Quite naturally they have posted their customers from time to time of what they have been doing through newspaper and circular advertising. With the truism in mind, that "seeing is believing," about 75 St. Louis stove merchants made an impromptu call on Buck's Stove & Range Company on the 28th ult., as above stated. It was intended to be in the nature of a surprise, but some one let the "cat out of the bag" and they found the company ready to receive them. After being escorted through the entire works they were finally halted on the third floor of the main building and asked to sit down and rest a few minutes. A glance showed that the company had not been caught napping, but had really gone to work and prepared a sumptuous repast, of both dry and wet goods, for the delectation of their visitors. After a few words of greeting all ast down to the lunch provided, to which full justice was done. There were no set speeches, but informal talks were made by nearly all present, which were favorably received. Toward the evening the gathering began to disperse, but not before the com-pany's officers had invited them. one and all, to be present in August, 1895, at which time they would come as guests of the company, and the company would then surprise them. The only evidence of trade which appeared during the visit was in the banquet hall, where two Buck's Royal air tight heaters were in full operation, and the critical manner in which they were examined and the favorable remarks made concerning them proved that these heaters have already won a place in the hearts of the St. Louis trade. Some of the guests suffered from headache and were ungracious enough to blame the excessive heat thrown out by these heaters as the cause, and rather than have any disagreement about the matter the company let it go at that.

### Floyd-Wells & Co.,

of Royersford, Pa., have just issued from the press their 1894-95 catalogue and price-list of stoves, ranges and heaters. It is a volume of nearly 130 pages, bound in flexible covers, with aide title in ailver upon a crimson ground. In offering this publication to the trade the manufacturers call particular attention to their extensive line of Irving ranges and to the numerous additions which have been made since the last issue of their catalogue. These new goods include the Grand Irving, Rose Irving, Glen Irving, Bold Irving and Lady Irving. These are goods of sub-stantial appearance and tasteful ornamentation, the oven door being embellished with a panel carrying the name "Irving" in nickeled letters. One of the apecial features of construction is the company's patented reverberatory oven, by which a continuous rotary circulation of the air in the oven is secured, independent of that obtained by their method of oven ventilation. By this circulation of the air in the oven the company claim that the heated air is conveyed to the article to be cooked, this action being caused by special convection flues in the oven plate. As one current of air is partly cooled by absorption in contact with the thing cooked, it is driven away by another current of highly heated air, and in this way the process of cooking is hastened. Another feature is a corrugated oven plate by which increased radiating surface is secured. In the Loyal and Grand Irving ranges a detachable grate rest is used, the awivel locking device being so constructed as to readily take out or replace the grates without disturbing the water front or linings. These ranges are made in a number of sizes and the usual modifications. In connection with each stove are given full descriptive particulars, together with oven capacity, prices and telegraphic code words. The goods telegraphic code words. The goods noted include the New Camaret, the Majesty. Dome, Concord, Charter, Holly and Home—the latter being a medium sized portable range fitted with either vertical or horizontal boiler, as may be preferred. The cook atoves are represented by the Valley Queen, Justice, Progress and Miner's Pick. Several pages are given up to illustrations of pine abeliance. tions of pipe shelves of various designs, and the four pieces which constitute a set of hollow ware. The second half of the catalogue is devoted to heaters. with the Rosemont occupying the leading place. This is a square base burner, made in four sizes, and is offered the trade unchanged from last year except as to a few minor features which have been perfected. The stove is of graceful outline and rich ornamentation. is made as a single and double heater. The New Rosemont is another member of this general class, as is also the Rosemont Parlor, a full return base burner. The Jewel Rosemont, the Star Rosemont, the Fame Rosemont, the Radiant Gem, the Darby, the Bloom, Volcano and the Bright Oak are all attractive heaters. The Volcano is referred to as being the first of its kind on the market, and the company expect that it will meet with a large sale. The Social is a richly treated Franklin stove, which has been on the market for several years and established itself in the confidence of the trade. "Hints and Suggestions," a list of brick linings which the company can furnish, the names of stoves and heaters which will hereafter be made to order only and not earried in stock, and an alphabetical index complete the catalogue.

### Crea, Graham & Co.

We have received from Crea, Graham & Co., Allegheny, Pa., a copy of an illustrated catalogue and price-list, which they have recently distributed to the trade. It is printed in blue ink npon a good quality of paper and is bound in colored paper covers. In their announcement to the trade the company call attention to various improvements and additions which have been made to their lines, and intimate that purchasers take no risks in buying Royal stoves. The leading place in the catalogue is given to the Crown Royal, a six hole range with ventilated oven, right or left hand feed, extra plates and sheet flues. It is followed by the Vesta, another six-hole range, which has been remodeled this season. The Richmond and the Prize Royal are also considered. Among the cook stoves we notice the Royal, for coal or wood, which has been improved for 1891; the Grand Royal; the New Royal, made in three sizea, for coal, and the Richmond, a cheap four-hole construction. heaters occupy the 16 pages which follow, attention being invited to the Queen Royal, an attractive Franklin stove, this being one of the latest additions to the company's assortment; the New Royal parlor, a large size open Franklin, which has been improved this season; the Clifton, a new cottage parlor; the Art Royal, a surface burner, made in two sizes; the Modoc, a heavy cannon stove; the Chieftain and the Laundry. The catalogue concludes with illustrations of the Royal furnace, made in seven sizes, and a list of hollow ware, a table showing the weight of castings used for repairs and directions for operating the stoves.

### The Chicago & Erie Stove Company

of West Twelfth street, Erie, Pa., send us a copy of their combined catalogue and price-list. They have added to their already extensive assortment many new specialties combining the latest improvements. The company do not il lustrate all of their goods, but confine the engravings to those of the leading specialties. In this way the catalogue is reduced in size and rendered more convenient for reference. The printing is in bluish ink, upon good paper, and the binding is in colored paper covers. The opening pages call attention to the Superb Helper, wrought steel range, made with patent double acting balanced oven door, the joints in the oven being double and very strongly braced and supported. The range is lined with sebestos and provided with heat reflectors and air chambers under the oven. These tend to make the oven act quickly and satisfactorily. The range is shown in a variety of styles, and in connectien with it is a plan view of the patent device employed for preventing oven bottoms from buckling. A new and heavy steel hotel range is one of the more recent additions to the company's goods, this

having a large oven and embedying the latest improvements. In the Quick Helper the manufacturers state that they have successfully combined the many advantages effered by both steel and cast ranges. The latest improvements are incorporated and the stove is offered in a variety of styles and sizes. Among the cast iron ranges we find the Duplex Invincible, made from new patterns and designs, and having large fire box, with ample flues, extended fire chamber for wood, ventilated oven, &c. The Capital Helper, made in three sizes; the Peerless Helper, a first class range, with apecial reference to burning wood; the Alert Helper, the Renown and the Fairmont-the latter being a four-hole range for soft coal or wood. The cook stoves include the Superior Helper, with cut feed for coal; the Forest Helper for wood and the Farmer's Helper, a four-hole wood cook, made in two sizes. The heating atoves are shown, with the Art Invincible occupying the place of honor. This is of good proportions and attractive ornamentation, it being only necessary to add a double heating collar and a damper to transform the stove into a double heater. The Brilliant Helper la another double heater of haudsome ornamentation and modern construction. The Duplex Helper, the Invincible Helper and the Royal Helper are parlor stoves of rich design, the decorative features involving the use of niekel and art tile. Following these we find Cottage Parlor, Franklin, Oak and Laundry stoves. The catalogue concludes with a line of handsome gas stoves adapted for heating and cooking purposes. The company state that their furnaces and gasoline atoves are shown in a separate catalogue.

### ODD PLATES.

THE ETNA HOT AIR FURNACE is the subject discussed in a 36-page pamphlet just issued from the press by Wood & just issued from the press by Wood & Bishop Company, 41 and 42 West Market square, Bangor, Maine. The furnace is made in portable form as well as for brick setting, and has a lever realized draw content grate mounted on working draw center grate mounted on rollers, cast iron shield, large clinker door, upper and lower cup joints, self cleaning radiator, sectional lire pot and castings of such form that they will not crack. Reasons are given in the catalogue why dealers should purchase the Etna coal furnace and there are suggestions offered for those who intend to buy so that the makers may know the size of furnace, registers and hot air pipes required. A sketch of the main floor plan of a cottage is presented, showing the positions of chimneys, doors and registers. Following this are floor plans of churches, with hints as to the method of warming. A large number of testimonial letters are also included in the pamphlet, these occupying something like 22 pages. At the close of the work is an illustrated At the notice of the Etna hot air and hot water heater, which is made in six sizes.

THE JOSEPH BELL STOVE COMPANY of Muncle, Ind., are about to enlarge their nickeling department in order to meet the increasing requirements of their trade. The Muncie newspapers state that they will also be obliged to materially increase the number of men employed in the works. It is gratifying to note such evidences of improvement in business.

THE NORTHWESTERN STOVE REPAIR COMPANY, with main office and works in Chicago, have opened a branch atore

at 509 North Fourth street, St. Louis. They will carry a full line of atove repairs, mica, stove blacking, stove putty, stove lifters, &c. 11. R. Gray is the manager of the branch.

The BLY GAS BURNER COMPANY is the name of a concern recently incorporated at Sioux City, Iowa, for the purpose of manufacturing and selling the Bly patent gas burner for cooking and heating purposes. The capital stock is \$25,000, with the privilege of increasing it to \$75,000. M. M. Gray is president, B. F. Bly vice-president and O. C. Servis accretary and treasurer.

THE JOSEPH BELL STOVE & RANGE COMPANY of Muncie, Ind., and Wheeling, W. Va., are vigorously pushing the sale of the Arlington Oak, a tastefully decorated heater embodying the latest features of utility and durability. It is made in three sizes, for coal or wood, and the manufacturers state that it is offered at a low price.

THE COLDWATER OIL STOVE COM-PANY of Coldwater, Mtch., are offering the All Right oil atove, equipped with their patent rewleking device, which is simple and easy of operation. The No. simple and easy of operation. The No. 20 size of the All Right is especially adapted for use in bathrooms and small sleeping rooms. The Sunbeam oil stove is referred to by the manufacturers as a little furnace on casters, and will heat a quart of water in 71 minutes. All Right and Sunbeam are tastefully ornamented with nickel, rendering them attractive heaters wherever employed. The company have agents all over the country and are in a position to handle orders promptly.

THE SMITH & ANTHONY COMPANY have resumed active operations at their foundry at Wakefield, Mass., following a brief shut down.

The Omaha Stove Repair Works of Omaha, Neb, are distributing a circular letter to the trade calling attention to the fact that they as wholesale jobbers are in a position to promptly supply stove repairs, mica and stove polish.

THE ELLWOOD GAS STOVE & STAMPING COMPANY, Ellwood City, Pa., manufacturers of gas and gasoline stoves, have just received some large orders for their goods for shipment to Kansas City and Cleveland. Their plant has been put in full operation in all departments, and will be fully employed for some time to come in filling these orders. This concern will shortly commence the erection of an iron truss building, 96 x 84 fect in size, to be used for japanning goods.

THE VAN WIE GAS STOVE WORKS, Rockford, Ill., were destroyed by fire on September 3. The damage incurred is placed at \$30,000, said to be covered by incurance. The works were unfortunately situated beyond the reach of the city water mains.

"Are you harry?" appears in heavy black type on a four-page folder which reaches us from the Lehlgh Stove & Mfg. Company, Lehighton, Pa. The folder carries an illustration of the Lehigh six-hole range, which is made in four sizes and 32 varieties. It is of substantial appearance, richly ornamented and embodies features which are calculated to contribute happiness to the household. The folder states that "happiness in this world is very largely a question of good health. Good health is, to a great degree, simply a matter of good digestion. Good

digestion cannot easily be maintained without good cooking. Good cooking requires not only skill and experience, Good cooking but proper appliances, the first of which in importance is a good range." The fourth page carries lines entitled "The Rustic Wooing," being copyrighted by the Lehigh Stove & Mfg. Company. The lines tell of a young rustic making love to a milkmaid, who promises to marry on condition that a nice kitchen range be purchased upon the commencement of housekeeping. The following apring they are married and friends come from a long distance to attend the ceremonies. Among the bride's presents is a new Lehigh range of the most improved style. Accompanying the folder is a balancing butterfly, an advertising novelty which has recently become popular in various lines of trade.

HENRY N. CLARK, 103-105 Black-stone street, Boston, Mass., is distributing a 32-page catalogue of heating atoves, which are offered in great variety. The leading place is given to the Premlum Square, a neat surface burner with oven attachment, and is followed by the Century Square, made in two sizes; the Belmar surface burner, without oven; the Glory, a sheet iron cylinder surface burner of low price; the Century and Gem cylinder stoves; the Beauty surface hurner, made in several sizes; the Flirt, shown with and without extra drum; the Columbian Prize, a neat open Franklin, made in three sizes; the Woodlawn cottage; the Glenwood, a neat box stove, made in four sizes; the Dash and Red Cloud cannon stoves. Illustrations are also given of the Improved Commander furnace. A circular which accompanies the catalogue illustrates the Parlor Dome oil heater, made by the Central Oil Gas Stove Com-

ACCORDING TO PRESS ADVICES from Spring City, Pa., the mounters employed at the works of the Yeager-Hunter Stove Mig. Company in the place named are making full time and the molders are working three days a week. Orders for stoves are said to be

THE LEHIGH STOVE COMPANY Of Lehighton, Pa., are the subject of a column article which appeared in the September 1 issue of the Carbon Advocate, published at the place named. The article describes a visit of a representative of the paper to the works of the company and what he saw there. Reference is also made to the leading producta of the company, special mention being made of the Lehigh Valley ranges and the Radiant Lehigh heater.

According to press disparches from New Castle, Pa., the trouble at the works of Baldwin & Graham is at an end, and the men have returned to work at the old wages. It is said that Pres. Martin Fox of the Iron Molders' Union went from Cincinnati to New Castle and had a conference with the proprietors of the works in which the books and records of the concern were open for his inspection, showing that the company were paying as high, if not higher, wages than other manufacturers.

THE PHILLIPS & CLARK STOVE COM-PANY, Geneva, N. Y., have resumed operations and are running full time with enough orders in sight to keep the entire force busy for a considerable

ment to the effect that there will be a special meeting of the stockholders of the company on Tuesday evening, September 18, for the purpose of considering a resolution to increase the capital stock from \$20,000 to \$50,000.

A PROMINENT AND VENERABLE FIG. URE in the stove trade has passed away. We regret to record the death of Amos C. Barstow, president of the Barstow Stove Company of Providence, R I., who died on Wednesday, September 5. Mr. Barstow, who was 81 years of age, had been actively engaged in the manufacture of stoves and furnaces for nearly 60 vears.

THE WORKS of the Joseph Bell Stove & Range Company, Wheeling, W. Va., are running full, with a good trade in prospect.

THE LITTLEFIELD STOVE COMPANY of Albany, N. Y., resumed operations last week at their works with a force of 30 men. When their plant on Pleasant avenue was closed in June, the molders and mounters were laid off, but the other hands were kept at work on the improvements to the buildings and machinery that have been in progress dur-ing the summer. We understand that additional men will be put to work as rapidly as circumstances will permit.

BENJAMIN CARVER, a leading citizen of Royersford, Pa., died in that town on September 4, at the age of 52. Mr. Carver had for long been connected with the Grander Stove Works of Royersford. He was burgess of the town, a member of the School Board, and actively interested in various local en-H

THE JOLIET STOVE WORKS, Joliet, Ill., are sending to their friends and customers paper backed blotters pre senting September calendars, together with pictures of Moore's air tight heat-ers. The advantages of these stoves are alluded to. The same firm send out other circulars relating to Moore's air tight heater, and another special circular gives illustrations and brief description of Moore's Fidelity range for soft coal or wood, which is made in 18 styles and sizes. Also Moore's Extra for soft coal or wood.

THE GIRARD STOVE & FOUNDRY COMPANY, Youngstown, Ohio, distributed at the Youngstown Fair neat little circulars directing attention to the Adelbert stoves and ranges of their manufacture. They mention that they make a complete line of these goods, and on the back of the circular Stambaugh & Thompson Company announce that they handle a full line of Adelbert atoves and ranges.

THE TRADE in general, as well as many friends, will learn with regret of the death of Charles F. Whiting, which took place at his residence in Orange, N. J., on Sunday, September 2. Mr. Whiting was connected with the stove trade from boyhood. At the time of his death he was employed as a salesman for Eugene Munsell & Co., 218 Water atrect, New York, with whom he had been for about five years. His funeral took place from his home on Tuesday, a large attendance of the stove fraternity being present.

II. II. WATERMAN, who has been for many years connected with the Central Oil Gas Stove Company, will now represent the Cleveland Foundry Company of Cleveland, Ohio, at 107 Beckman street, F. A. WILLIAMS, sccretary of the Glrard Stove & Foundry Company, Girard, Ohio, has issued an announce- Mr. Waterman is particularly well

known to the stove trade in the Southern States, where he traveled many years. He has a good box of cigars in his drawer, which he will be happy to share with his numerous friends, whom he will be glad to see at his new address. The Cleveland Foundry Company's store will be in shape for business about the middle of next week when a full line of the gas and oil heating and cooking stoves and other articles manufactured by the concern will be ready for inspection. The store is very favor-ably located in the heart of the New York stove district.

WHAT MIGHT HAVE BEEN & serious fire broke out on the 1st inst. in Cribben, Sexton & Co.'s stove foundry, at Erie and Market streets, Chicago. One of the cupolas became overheated and ignited the roof timbers. The city fire department extingulahed the flames after considerable damage had been done to the roof, but fortunately before the fire had apread to other buildings. No patterns were destroyed, and the operation of the plant will hardly be interfered with. The damage is estimated at about \$1500.

R. Robinson & Sons, 105 Lake street, Chicago, have issued a neat little illustrated catalogue, descriptive of Splendid oil heaters, for which they Inustrated catalogue, descriptive of Splendid oil heaters, for which they are sales agents. Five patterns are illustrated: The Splendid B 8, the Splendid B 10, the No. 15 Splendid, the 215 Novelty Splendid and the No. 25 Parlor Splendid. It is an unusually large assortment of oil heaters and therefore adapted to meet all testes and therefore adapted to meet all tastes and requirements.

FRANK F. PROCTOR, accretary of the Culter & Proctor Stove Company, Peoria, Ill., died on August 4, aged 34

A method of firing with liquid fuel is described in Chamber's Journal. It has lately been adopted for domestic purposes in some houses at Baku, the capital of the Russlan petroleum district. A tank near the top of the house contains the oil, which is led by 1 inch tubes to the various stoves. Each stove is provided with a small cast iron disk or plate placed in front of the stove door, which is plerced with a small opening, so as to create a strong draft. Upon this plate the oil slowly drips, and when once the metal plate is warmed and the supply of oil regulated, it burns without any further attention. The oll employed is the residue from the petroleum after the more volatile elements, gasoline, benzoline, kerosene, &c., have been driven off by distillation.

At San Antonia, Texas, a company have been organized with a capital of \$1,000,000, under the name of the Rio Grande Valley Canal & Irrigation Company, to establish a system of irrigating canala in the lower border countles of Texas. Several hundred thousand acres of arid lands are to be brought into cultivation, the water being drawn from the Rio Grande.

The railroad journals state that steps are being taken for a close traffic alliance between the Big Four, the Chesapeake & Ohio and the Southern Railway Company. It is also said that arrangements are being conducted whereby the Southern Railway and the Chesapeake & Ohio will eventually agree to stop the cutting of rates and will reduce expenses at common points.

### HEATING & PLUMBING.

### NEW WORK AND CONTRACTS.

THE CONTRACT for heating the new post office, Norwich, Conn., has been swarded to J. P. Barstow & Co.

THE HARTFORD HOT WATER HEATER COMPANY, Hartford, Conn., are putting one of their heaters in Shannon's drug store on Trumbull street, Hartford, and one in the greenbouse of President Woodruff of the Seth Thomas Clock Company, Thomaston.

GEORGE M. AINSWORTH, Athol, Mass., has the contract to do the plumbing, gas piping and the work of putting speaking tubes in the new school house.

CONODON BROTHERS, East Greenwich, R. I., have secured the contract for steam heating Judge Lewis' house, Kingston, R. I.; also, they will place a Richmond hot water laundry range in Academy Building, East Greenwich, R. I.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until September 20, for the plumbing, gas piping and electric wire conduits for the United States Custom House and Post Office Building at Newark, N. J. Drawings and specifications may be obtained from the Supervising Architect, Washington, or from the superintendent at Newark, N. J.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until September 25, for a low pressure hot water heating apparatus for the United States Custom House and Post Office Building at Galens, Ill., in accordance with drawings and specifications, which may be obtained from the custodism at Galena, Ill., or from the Supervising Architect at Washington.

THE F. A. HEADSON COMPANY of Wausau, Wis., have secured the contract for putting in a steam heating plant in the Antigo Court House and Jail.

A CONTRACT for heating the new Citizens' Bank Block, at St. Johnsbury, Vt., has been awarded to A. D. Noyes & Co. of that place.

B. F. Shore, Wilmington, Del., was awarded the contract for the heating apparatus of the Clayton House, his bid being \$6773.87.

MATT. WATSON, Salina, Kan., has secured the contract for putting in the steam heating apparatus at the Ottawa National Bank.

E. E. Morrow, Santa Rosa, Cal., was given the contract for plumbing at the County Home.

Baker & Smith, New York, were awarded the contract for heating the new school building at West Hoboken, N. J., for \$3168.

W. H. Dunn, a Cleveland architect, has been in Lorain, Ohio, looking over the Wagner Opera House, which he is to reconstruct and into which he is to introduce a new heating system.

THE BUILDING COMMITTEE of the Board of Control decided to award the contract to put in steam heating in the Ninth Ward School Building, at Allentown, Pa., to Evans, Seagreaves & Co., for \$2215.

RECENT IMPROVEMENTS in the Doylestown, Pa., public school building inthat state.

clude a new system of steam heating introduced by Rufe Brothers, which was so designed as to retain intact the old system of ventilation.

A CONTRACT for the boiler and steam fitting in the County House, Battle Creek, Mich., was awarded to A. F. Bock of that city.

A contract for heating the Court House, at Alliance, Ohlo, was awarded to Theobald & Co., Canton, Ohio, for \$7784. The contract for the boilers was awarded to Welton Brothers of Canton for \$1649.

L. B. Harton, Alliance, Ohio, has been awarded the contract for putting in the heating apparatus for the new hospital at the infirmary, his bid being \$1924.

THE CONTRACT for heating, ventilating and plumbing the High School Building at Northboro, Mass., has been awarded to O'Toole Brothers of Clinton, Mass.

F. W. CODDINO, Worcester, Mass., has secured the contract for steam heating the alms house at Gardiner, the price being \$600.

THE COMMON COUNCIL OF PROVIDENCE, R. I., have appropriated \$2000 additional for heating and lighting the Boyden atreet school building.

T. P. AITKIN has been awarded the contract to put in the heating apparatus in the Eighth District School House, at Manchester, Conn., the contract price being \$430.

THE CONTRACT for heating the new Congregational Church, Gloversville, N. Y., was let to H. J. Jenkins, who will use two large Economy heaters.

MICHAEL DILLON is putting new plumbing arrangements in the residence of Joseph Martin, Church street, Doylestown, Pa.

The Secretary of War having authorized the construction of a military post near Little Rock, Ark., bids will be received for the work, including plumbing, heating and gas piping.

THE EXETER MACHINE WORKS, Exeter, N. H, have been awarded the contract for heating the Rockingham National Bank, at Portsmouth.

THE CHICAGO HEATING COMPANY, 40 North Clark street, Chicago, have the contract for hot water heating in the residence of J. Doyle, Washington boulevard and Kedzie avenue.

Two LARGE (No. 26) Gorton patent side feed hot water boilers will be used for heating the Fogg Lodging House recently erected on Fifty-third street near Eleventh avenue, New York. The installation is made by Gillis & Geoghegan of this city.

KEUM BROS. & MERTZ, 289 East Kinzie street, Chicago, are to install a tubular boiler power plant for the Price Flavoring Extract Company, Illinois and Cass atreets.

JACOB G. WEBER, 244 North Clark street, Chicsgo, has the contract for the plumbing and sewerage in the residence of E. Hoffman, 462 Wabash avenue.

GEO. L. RCOD, 79 Lake street, Chicago, ia to place a Prince Royal combination heater in the residence of G. W. Meeker, North avenue and Astor street.

ELLIOTT BNOTHERS of Colfax, Ill., have opened a tin shop at Arrowsmith, that state.

### News and Notes.

The anthracite coal sales agents met in New York City on August 29 and decided to fix the output for September at 2,500,000 tons. No action as to prices was taken.

It is stated that arrangements have been made to ship 100,000 tons of bituminous coal this fall to Brazil from Philadelphia.

The Swiss Federal Council has approved the scheme for a Jura-Simplon railway tunnel through the Simplon, to cost \$10,960,000. The plan is to be submitted for the approval of the Italian Government.

During the first six months after the opening of the New Corinth Canal the receipts little more than balanced the expenditure.

In a report sent to the State Department by United States Consul-General Williams, at Havana, that official states that no previous period in the history of the Cuban sugar industry has been to disastrous as that beginning in August, 1893. The planters suffered heavy losses, although the quantity of sugar produced was the largest recorded on the island. A general report on the industry, which is to be laid before the Spanish Cortes at the next session, calls for remedial legislation. It asserts that, with very few exceptions, the sugar works not only yield no profits, but do not meet expenses, including interest.

English capitalists are said to have bought large tracts of coal lauds in Southern Colorado, which are to be developed immediately.

Heavy rains have damaged Alabama's cotton crop 20 to 25 per cent.

The Russian Government has decided upon the construction of a line of railway from Samarcand to Khokand via. Khodschend. It is expected that the line-will give a great impetus to the cotton trade of Asiatic Russia.

The war news from the East is puzzling. Both sides claim victories at the same time and place; but it would appear that the fighting, so far, has not been very extensive. Energetic military preparations, meanwhile, are being made by both China and Japan.

The Chief of Naval Ordnance has postponed the test of small arms for the navy until October 1, owing to the weapons of the competing manufacturers not being ready on September 1—the day originally fixed for commencing the trials.

English shareholders of the Chignecto ship railway of Canada having subscribed \$1,500,000, it is hoped that the work may yet be completed. A provisional contract to furnish the railway has been awarded, contingent on the desired extension of the time by the Government.

The Raven Stove Polish Company, \$2 lake street, Chicago, are distributing eards advertising their Red Fire Tinsel, intended for use by stove manufacturers and merchants on their sample stoves, giving them the appearance of being in actual operation with firea glowing. A small piece is fastened on each card. The color is remarkably brilliant. This tinsel is made of copper and is indestructible. It is placed behind the mica and fastened in with the mica holder. It is furnished in sheets  $4\frac{1}{4} \times 11$  inches in size.

# TRADE REPORT.

### The Iron Market.

The Connellsville Coke strike is now a "closed incident," and the serious question is whether the Iron trade of the country must again return to the state of affairs which prevailed before that senseless struggle. A review of the conditions prevailing before the atrike and now dominating the markets brings out this one salient fact, that consumption is greater now than it then was. The soft condition of the markets proves that it is not sufficiently great to hold out hopes of an early advance, and the grave question is whether there will be demand enough to prevent a decline, possibly back to the old figures, for Bessemer Pig and Steel Billets.

Ore is actually cheaper than it was, Messaba having been offered lately as low as \$2.10. Coke is still unsettled as to values, no large contracts having been placed lately. So far as Raw Material is concerned there is, therefore, little change in the situation.

In Manufactured Iron and Steel the marketa are generally very quiet, and there is a distinct falling off in the demand, which is reflected in a weakening of prices. It is the old atory that the large mills insist upon being fully employed, and sacrificing mercileasly to attain that end.

To judge from the busy condition of the Cast Iron Pipe foundries, the amount of municipal work going on is large. Town and county bonds sell better than discredited railroad securities.

Plg Iron.—There are some inquiries in the New York market, but the movement is as yet very moderate. We quote standard branda \$12.50 @ \$13 for No. 1; \$11 @ \$12 for No. 2, at tidewater. Southern Iron, same delivery, \$11.50 @ \$12.25 for No. 1; \$10.50 @ \$11 for No. 2; \$10 @ \$10.25 for No. 3; \$10.25 @ \$10.75 for No. 2 Soft, and \$10.50 @ \$11 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9.75 @ \$10.25.

In the Philadelphia market the demand for Pig Iron is not quite as "snappy" as it was two or three weeks \*go, and things may be said to have almost fallen into the old time monotony. Furnaces are well sold up however, and there are no inconvenient accumulations, but there is less disposition to provide for the future, so that the market while not positively weak, is dull and monotonous. General quotations are about as follows for Philadelphia and nearby deliveries:

Slandard No. 1 Foundry X	\$12.50	@ 8	13.00
Standard No. 2 Foundry X	11,50	a	12 00
No. 2 Plain	, 10.75	0	11.00
No. 1 Soft	. 11,50		
No. 2 Soft		0	11.00

Our Chicago advices indicate that Local Coke Iron has been more active, the sales for the week including several round lots. Consider ably more business is in sight owing to the gradual extension of the territory covered from that producing center. Shipments are very heavy, the leading producer having delivered the last month the largest quantity sent out any month since June, 1893. Southern fur-

nace agents report a little better demand for carload lots and are inclined to feel confident that the near future will bring them more business. One sale of 100 tons of No. 2 Soft was made for immediate delivery at \$7.25, at furnace. Lake Superior Charcoal is in somewhat better demand in carloads, but inquiries for round lots are still wanting. Quotations are given as follows for cash:

Lake Superior Charcoai	\$14.25 @	\$15.00
Local Coke Foundry, No. 1	10.25 @	10.50
Local Coke Foundry, No. 2	10.00 @	10,25
Local Coke Foundry, No. 8	9.50 @	10.00
Local Scotch	10.25 @	10.50
Cocal Scotch	13,00 @	13.60
Ohio Strong Softeners No. 1		40.00
Southern Silvery, No. 1	@

Southern Coke, No. 2	10.75 @	11.25
Southern Coke, No. 3	10.50 @	10.75
Southern, No. 1. Soft	10.75 @	11.25
Southern. No. 2, Soft	10.50 @	10.75
Southern. No. 2, cort	ã	
Tennessee Charcoal, No. 1		
Tennessee Charcoal, No. 2	@	
Alabama Car Wheel	17.50 @	
Jackson County Silvery	15.25 @	
Other Obio Silvery		14.50
Owner on the contract of the c	_	

There is a wide difference in views as to the future of the Pig Iron market in the Pittsburgh district. Somein the trade believe that the decline is only temporary, while others hold to the belief that prices will go still lower. It would seem that the Finished Material market is the key of the situation. If there is a good demand for Finished products, thus creating an active Steel market, furnacemen may be able to hold prices where they are, but unless there is a very much heavier demand made on the finishing mills, it is not unwise to assume that Pig Iron will be lower. A prominent Valley furnace, making a high grade of Foundry Irov, canvassed this market pretty thoroughly last week and took a number of orders on the basis of \$11.75, Pittsburgh, for No. 1 and \$10.75 for No. 2. Quotations are given as follows:

Cincinnati reports are to the effect that a fair volume of business has been done during the week, nearly all which was in that district, the demand coming largely from the Iron Pipe works, which seem to have an unusually good demand for Pipe for this season of the year, and for small sizes, and able to obtain better prices than have prevailed during the summer. The demand is largely for No. 2 Foundry, No. 2 and No. 1 Soft, but the lower grades are selling well, and the market may be called steady and firm. Prices are the same for forward delivery, running to the end of the year as for current delivery, and there have been sales covering three months of next year on the same basis. The Iron Pipe works are melting much metal, but the Stove works are doing more work. The agricultural works are not idle, but have not begun to work actively. Quotations

are as toriowa.	
Southern Coko. No. 1 \$10.50 @ \$	10.75
Jouthern Coke, No. 2 5.17 W	10,00

standard Southern Car Wheel 10.20 @	17.00
Lake Superior Car Wheel and	) 5 7 E
Malloable 15.25 @	15 75

The past week is referred to as not having been particularly active in the St. Louis Pig Iron market. Sales have been limited both in size and quantity, and yet there is a number of inquiries in the market which will very likely result in business. There is no disposition io shado prices, as it has been pretty thoroughly demonstrated that sales cannot be made simply because the Iron is cheap. The situation shows improvement, and, while no great advance in prices is looked for, a slight improvement over io day's prices does not seem unreasonable to expect. Sales during the week were made on the basis of prices as quoted herewith, which are for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foun-	k11.00	<u>a</u>	\$11.25
Bouthern Coke, No. 2 Foun-	10.05	_	10.50
dry Southern Coke, No. 3 Foun-	10.20	•	10.00
dry	9.75		10.00 17.00
Southern Car Wheel	10.00	en.	11.00

### Metal Market.

Pig Tin. — Comparatively little change in prices has taken place during the week, and dealings on speculative account reached only a moderate total. Purchases by interior jobbers have increased somewhat, however, and business with consumers has been more liberal. Prices for large lots, at this writing, are about 16¢ net cash, while for small parcels of Straits Pig 17¢ (2) 17½ (3) It is asked by jobbers and retail dealers.

Copper.—New business has been on a moderate scale, and the demand in general very slack. It is said that some of the prominent Lake Superior producers have, however, contracted with purchasers to furnish some 10,000,000 or 15,000,000 lbs during the rest of the vear, at a price said to be about 9¢ \$\overline{\psi}\$ lb. Prices for small lots are unchanged at former quotations.

Sheet Copper.—The situation of Manufactured Copper shows little change. Orders and inquiries continue moderate and still below the average. Prices are steady as per list.

Pig Lead.—The market is fairly firm, because of moderate offering. Only routine business has been done this week although inquiry is rather more free. Near future deliveries are somewhat uneven and rather weak, with freer offering. For small lots of American Pig from store  $3\frac{\pi}{4}\phi$  @  $3\frac{\pi}{4}\phi$  is a fair quotation. Manufactured Lead is quiet.

Spelter. — Hardly any change har taken place in the market here. The improvement continues slow, and consumers are extremely indifferent. Prices for small parcels remain at about  $4\frac{1}{4}\phi$  for ordinary Western brands.

Antimony.—Spot prices for moderate quantities are about 91¢ for Hallett's and 101¢ for Cookson's. There has been little business outside the ordinary jobbing distribution.

Solder.—Prices for small lots have been marked down during the week to 12¢ % lb for \$\frac{1}{2}\$ and \$\frac{1}{2}\$, and 10\frac{1}{2}\$\$ @ 11\$\$ for No. 1.

Tin Plate —Spot dealings in the wholesale market have been on a rather moderate scale and chicfly at the prices that ruled a week ago. Jobbers report, nevertheless, that purchasing for immediate delivery by the smaller consumers has been very fairly active, particularly in the line of Roofing Plates. In some descriptions of Plates stocks in dealers' hands are running very low, and consumers are obliged to wait the delivery of orders until the Plates can be withdrawn from bond, which is just now a somewhat lengthy operation. Futures are quieter, and, while not positively lower, prices in this market seem rather easier. In the West the trade in Tin Plates is reported as being quite heavy.

A London cable of September 5 to The Iron Age reports as follows in regard to the British market: Tin Plate has been quiet, and prices are easy. Home inquiry is fair, and there is some call for squares and odd sizes for the oil trade. American buyers, as a rule, are holding off. Makers' quotations remain about the same as they were last week.

Sheet Iron.—The demand for Black Iron remains about the same as last week. As far as jobbers are concerned, the trade in this material is dull. Manufacturers' agents appear to book enough orders to keep their mills busy, but rumers are prevalent to the effect that Black Plates for tinning are becoming somewhat of a drug. Galvanized Iron is in good demand, with prices firm, although no effort has been yet made towards a general advance. Many mills prefer not to be able to make deliveries on new orders under a month or six weeks. For small quantities 75 % off is the usual rate.

Dr. David T. Day, Chief of the Division of Mining Statistics and Technology of the United States Geological Survey, has issued the preliminary statement of the production of Spelter for the first six months of 1894. It was compiled by C. Kirchhoff, special agent:

Production of Speller Semi-Annually (Short Tons).

States.	First half 1892.	Second half 1892.	First half less.	Second half 1893.	First half 1894.
Eastern and Southern.	6,901	7,594	7,380	5,304	5,064
Illinois and Indiann	15,483	15,900	16,427	13,169	13,392
Kansas	14,161	10,551	13,269	9,546	11,250
Missouri	8,954	7,713	8,718	5.019	6,455
Totals	45,499	41,761	45,794	33,038	36,164

A partial statement of stocks shows a decline from 3089 tons on January 1, 1894, to 2859 tons on July 1, 1894.

Pittsburgh Reduction Company, Pittsburgh, Pa., manufacturers of pure aluminum, have located a branch office in New York at 4 Havemeyer Building, corner Church and Dey streets. It will be in charge of James C. McGuire, New York agent and consulting engineer. Their new works, at Niagara Falls, N. Y., will be completed very soon. They will continue to operate their present works at New Kensington, Pa.

ELASTIC ROOF CEMENT, asbestos furnace cement and asbestos stove lining are the three articles to which especial attention is directed in an advertising card distributed by the Troy Paint & Color Works of Troy, N. Y.

### Chicago Report.

Scrap.—Some kinds of Scrap are becoming scarce, particularly Borings and Turnings. This is caused by the small quantity coming on the market, which falls below even the limited quantity consumed. Dealers quote the following list of buying prices, Chicago delivery:

•		
P	er net ton.	Per Ib
No. I Wrought Scrap	\$7.00	
Machinery Cast	6.00	
Malleable Cast	5.00

The report of the secretary of the New Orleans Cotton Exchange, on the cotton crop for 1893-94, places the total yield at 7.549 879 bales, an in crosse of 849,452 bales over that of last sesson. The largest part of the gain was in Alabama, Georgia, Florida and North Carollna. Secretary Hester puts the average commercial value of the crop at \$37.50 per bale, sgainst \$42.50 last year and \$37.50 in 1891-92. The total value he places at \$283,118,000, against \$284,150,000 last year, so that while the output of last year was nearly 850,000 bales less its value was \$1,032,000 more than this year's crop.

As illustrating the present excessive freight rates for goods experted to Central and South America a Pittsburgh journal records that a narrow gauge locomotive, bought at that city for \$3575, was recently delivered at Samaca, Colombia, for \$3595, with \$10 904 charges against it. The iron work for four cars, costing \$194 48, reached their destination with a bill of \$1610. A turbine wheel worth \$708 cost when carried within 150 miles of Samaca \$3760.

### CONDITION OF THE

### Hardware Trade.

THE TRADE will note with sati tion the evidence of a general improvement in the demand upon the jobbing trade which is contained in the following reports from the leading Hardware centers. It will be seen that in nearly all cases a decided increase in the volume of business is reported and reference made to the prevalence of a perceptibly better feeling. Business is experiencing relief from the uncertainty which has prevailed during the past months owing to tariff agita-tion, and now that this question is settled, for the present at least, trade is apparently resuming its normal course, and whatever may be the changes in price which will result from the new law, its enactment removes one of the obstacles to business ac-tivity. The effect of this is as yet more marked in some other lines of business than in Hardware, and merchants in such lines report a very decided increase in the demand, many houses being exceedingly busy. It is to be expected that Hardware and related lines will soon feel the influence of the improved general conditions of business, and already there is a decided improvement in the feeling of merchants and manufacturers, as well as in the volume of business. It is to be in the volume of business. expected that as the month advances there will be a further improvement. The smaller trade are replenishing stocks more freely than for some time. and their orders indicate that they are doing a better business and are anticipating a fair, if not heavy, trade dur-ing the next few months. Prices are without important change. While values are, on the whole, as low as they have been at any time during the year, in only a few cases has there been any further shrinkage, and, though low, prices are, on the whole, well maintained.

Advices from Chicago.—The Shelf Hardware jobbers note a very decided increase in the demand for all classes of goods. Some houses have been obliged to work their packing departments at night. Merchants now show more of a disposition to stock up. New ventures are also a little more frequent in the Hardware line and several full stocks have been shipped out recently. Pig tin and solder have been reduced in price to conform with the new rates of duty. Heavy Hardware jobbers report that they have gained fully one-third in volume of business, as compared with the average of the early summer months. General consumers are buying Iron and Steel in larger quantities, and manufacturers with mill contracts are occasionally picking up the material needed to help out.

### Notes on Prices.

Wire Nails.—There continues to be a good demand for Wire Nai's, and the aggregate of business during the past week has been fair. Some of the large buyers have been placing orders, but a good proportion of the business is from comparatively small houses, who are purchasing in moderate lots. Small lots from store in New York are quoted at \$1.25.

Advices from Chicago.—Transactions are very much more numerous and while the volume of business is possibly still below the total production of all the factories in operation, yet inquiries are of such a character that the trade may be expected shortly to take the entire output. Some little irregu-

lari! v been noted has owing to efforts to market job lots of Nails not made by the standard mills, but the trade in general has not been affected and prices are steady. Jobbers quote small lots from stock at \$1.15.

Cut Nails. - A fair business is doing in Cut Nails, the price remaining substantially as at our last report. The stantially as at our last report. store price in New York for small lots is \$1.05 to \$1.10.

Advices from Chicago. -The month of August appears to have been quite a fair month for the local trade. Orders were not large but steady, and business will probably continue running in the same way during the current month. Small lots from stock are quoted at \$1.10 to \$1.15.

Barb Wire .- The Barb Wire market continues without special features, the demand being moderate and prices steady. The market is represented by the following quotations for Four Point Galvanized, delivered at the points named: Pittsburgh, \$2 to \$2 05; Cleveland 20 05 to \$2 10. land, \$2.05 to \$2.10; Cincinnati, Allentown, Chicago, or New York, \$2.20 to \$2.25.

Advices from Chicago.—Mail orders ahow a steady increase on manufacturers' desks. These are generally small, ers' desks. but here and there a country merchant is found with sufficient faith in the fut ure to purchase 50 to 100 tons. Prices show no indication of weakness.

Jobbers report a fair demand from stock. Prices are still quoted at \$2.35 for small lots of Galvanized, with 10 cents off for carloads.

Major's Ice Flout.-This device was described in our last issue as put on the market by A. Major, 232 William street, New York. The Float is sold to the trade at the following net prices:

	Each.
For Coolers 6, 7 and 8 inches in diameter	\$1.00
For Coolers 9 and 10 inches in diam-	
For Coolers 11 and 12 inches in diam-	1.25
eter	1.50
For Coolers 13 and 14 inches in diam-	2.00
Larger sizes are sold at proportion	
higher prices.	-

Glass. -There has not been any change in quotations up to the present time. Plate Glass factories have been in operation for the past three months with a fair demand for their product. It is too soon to decide whether the reduction of duties will have any immediate effect upon prices of Plate Glass in the Eastern markets. Pittsburgh quotations on Window Glass are as follows: Single strength 85 and 5 per cent. discount; double atrength 85 and 10 per cent. discount. Plate Glass is quoted at 70 to 70 and 10 per cent. discount from Eastern list, according to the size of Glass, and from 70 and 5 to 60 and 20 per cent. diacount from Western list, according to size of Glass.

Old Metals.—The demand continues moderate and prices without radical change. The following quotations rep resent about the rates now paid by New York dealers:

TOTA CCALCIA

### Trade Notes.

AN INTERESTING ADVERTISEMENT is that of the Star Coupler Company, 801 Wainwright Building, St. Louis, Mo., which directs attention to the Star Water Back and Boiler Couplers. Two Water Back and Boiler Couplers. illustrations show the features of this device and a third cut shows its applica ion to a range boiler connections. A list of local agents is given in the announcement.

THE AMERICAN CAN & STAMPING WORKS, LIMITED, have been incorporated at New Orleans, La. Charles B. Emmerich, George H. Dunbar, F. B. Dunbar, Jules Aldidge and W. T. Seaton are the directors of the com-pany. The company will manufacture cans and do a general stamping business. The capital stock is \$50,000.

THE WOODEN WARE MFG. COMPANY, Midland, Mich., will remove their plant to Fort Smith, Ark.

JENKINS' STANDARD PACKING is the subject of an announcement elsewhere in this issue made by Jenkins Brothers, with houses in New York. Chicago, Philadelphia and Boston. The excellent qualities of this well-known pack-ing are alluded to in the text of the announcement.

C. SIDNEY SHEPARD & Co., Chicago, Ill., issue, under date of September 3, a price list of metals. The list is pubprice list of metals. The list is published in a pamphlet of a dozen pages. Reference is first made to Tin Plates and Terne Plates, then Sheet Iron, Sheet Steel, Galvanized Iron, Yeager's Soldering Salts, Tin, Sheet Zinc, Copper Wire, R vets, Babbitt Metal, &c.

THE AMERICAN STOVE BOARD COM-PANY, 306 Water street, New York, with Chicago office at 110 Ontarlo street, issue a little circular directing attention to their line of wood lined and paper lined Stove Boards. The designs and the principal atyles are illustrated and full lists are given.

Bronson & NEAR, Cleveland, Ohio, and New York, have changed their

address, and are now located at 3 Warren street, New York. Among other goods they are representing the Bread and Cake, Paring and Coring Knives manufactured by Chas. F. Spery & Co., St. Louis, Mo.

### Air Velocity.

One of the first matters requiring decision in the design of a heating and ventilating system is that of the permissible velocity of the air through ducts, flues and inlet or outlet open-Of course, much will depend upon the character of the system adopted. At all events, extremely low velocities, while economically the best as regards operating expenses, necessitate flues and ducts of such size as to make their satisfactory introduction exceedingly difficult in a building where large volumes of air are required. With the furnace or ordinary indirect systems, horizontal ducts of any considerable extent are avoided, and therefore consideration of velocity therein becomes less important. But with the blower system, where the means of movement are positive, high velocities are admissible, and notwithstanding the losses by friction, the gain in compactness, the reduction in first cost and the freedom from the inconvenience of large overhead ducts encroaching on head room, are sufficient to warrant the arrangement. Thus velocities running up to 2000 and 2500 feet per minute, reduced to about 1500 feet at the connections to the flues, are very commonly employed. But a sufficiently low velocity through an ontlet register or screen can only be equably secured over its entire surface by maintaining a comparatively slow air movement within the flue. In fact, the very best results can only be obtained by making the area of flue and net area of opening the same. In ordinary practice with the blower system, however, where the flues are of reasonable size the velocity within them will be found to be between 500 and 800 feet in well designed arrangements, while the velocity through openings, figured on net area of register or screen, will average between 300 and 500 feet. Of course this applies to wall outlets above head level. When

the openings are so located as to deliver the air directly against the persons of any occupants of the apartment the velocity must be much reduced; how much must depend upon the arrangement. But certain it is that many schemes of floor admission have failed because of the comparatively high velocity of the air. Unless special provisions are made for deflecting the air currents the velocity through floor openings beneath seats, as in a theater, should not exceed 100 feet per minute and had better be less if success is to be assured.

### Anemometer Measurements.

While the measurement of air volumes and velocities appears extremely simple, there is, nevertheless, opportunity to present apparently correct but very misleading results. Anemometers are not in themselves the most reliable of instruments, and at low velocities, when the reading of the dial is less than the correction to be applied (for almost universally each reading has to be corrected by addition or subtraction of an amount determined by experiments of the makers), it is exceedingly doubtful if even the average anemometer will prove itself reliable. In open air the measurement of velocity is a very simple matter, but great care is necessary when the velocity is to be determined for the air delivered through a small grate opening. Of course any kind of grating must split up the solid volume of air into numerous small iets or streams, which at some unknown distance from the opening again unite, but in a constantly spreading volume. When the flue velocity considerably exceeds that desired through the registers or screen (which can only be regulated by relative areas) there is a strong tendency toward great variations in velocity at different portions of the grating. A continuous reading made by moving the anemometer back and forth across the opening is approximately correct, but is not absolutely reliable. It is therefore necessary that a series of readings should be taken, which can best be done by dividing the area into squares by stretching strings across it and then taking readings at least one minute long at each space. Just how far in front of the grating the anemometer should be held is somewhat difficult to determine, but a distance of 4 inches when the velocity is 300 to 500 feet will give very accurate readings, which, of course, are to be averaged and then multiplied by the gross area of opening to ascertain the volume. Sometimes at one portion of the screen a reverse current will be detected-in fact, the air is so erratie

in its movement that little can be predicted as to the detailed results with any given arrangement. Nevertheless. a general basis may be determined for certain combinations such that rough tests may be made by taking the velocity at some given point of the face of the opening, which corresponds to the average of the readings in previous tests. All anemom-ter tests should be carefully checked if more than moderate accuracy is desired. It will frequently be noted that the action of the wind outside the building is such as to not only change the average velocity, but also to entirely change the readings at various points over an opening, so that where positive readings were previously shown negative results may appear, or vice versa, when the second set of readings is made. It is therefore unsafe to place great dependence upon any report of velocities and volumes unless all the circumstances of the tests are clearly specified.

### Franklin Institute Drawing School.

The drawing school of the Franklin Institute, Philadelphia, opens again for the winter term on Tuesday next, September 18, the term ending on January 10, 1895. On January 15 the spring term of the school will commence, lasting until April 25, 1895, on which day the closing exercises will be held. Each term comprises 15 weeks, instruction being given every Tuesday and Thursday evening, from 7,15 to 9.15 p.m. A full course comprises four terms for full course comprises four terms. for each of which a tuition fee of \$5 is charged. At the end of the course certificates are awarded to such students as have shown the requisite attention, industry and progress. As we have before pointed out, this drawing class, in common with classes of a similar character in New York and other cities, supplies a most valuable means of assistance in their trades and professions to young artisans and others who could not otherwise obtain the thorough knowledge of draftsmanship which can be gained in a course at these schools at a very mod-The Franklin Institute erate cost. Drawing School offers complete instruction based upon the most modern and approved practice in mechanical, architectural and free hand drawing. classes are progressive and are five in number. They include a junior, an intermediate and a senior mechanical class, in which methods, technicalities and styles of drafting and designing engineering work are instilled, com-mencing with the mest elementary work and proceeding to the more complicated machinery drawing. The other two classes are for architectural drawing, in which designs, plans, elevations and details of buildings, &c., are taught, and the free hand class, in which drawing with pen, pencil and crayon from the flat and from casts is treated. Ticketa for these classes can be applied for to William II. Thorne, director, or obtained at the Hall of the Institute, 15 South Seventh street, Philadelphia.

# THE LETTER BOX.

### Making a Finial.

From T. P. F., New York.—I have a finial to make like the accompanying sketch, and I wish some reader of The Metal Worker would enlighten me on the best way to make it.

Note. - The sketch sent by onr correapondent shows a finial 181 inches high, the top consisting of an 8-inch ball resting on a cone shaped base, the sides of which, however, are slightly incurved. We would advise our correspondent that 8-inch balls can be purchased in quantities from ornament makers, and probably it would be much more satistory to buy one than attempt to make it. The conical part of the finial may be made of a single sheet or of several pieces, as desired. If the incurve is only slight galvanized iron will do, but if there is much curvature we would advise the use of copper or zinc. The mctal in any case will have to be stretched with a hammer. After making the cone the approximate shape desired, the stretching, as mentioned, is done by means of a hammer until the exact curvature is reached.

## Weight of Copper for Cornices.

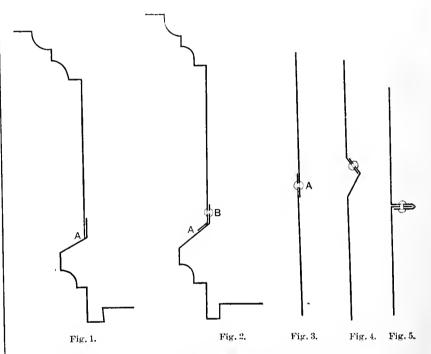

From T. D. J., New York.—Please inform me through The Metal Worker what is the best gauge of copper to use in manufacturing cornices so that they will keep straight and not buckle—16, 18 or 20 ounce copper?

Answer.-A cornice can be made straight and free from buckles using either 16, 18 or 20 ounce copper, provided cold rolled copper is used which is perfectly smooth and flat, and provided, furthermore, that the mechanic has a little experience in working copper cornices. It is natural that a cornice made of 20-ounce copper would be firmer and stronger; but there is no reason why a cornice made of 16-ounce copper, for instauce, should not also be atraight and free from buckles. We know of a cornice now being made, 60 feet long, 8 feet in hight, which will be made of 16-ounce cold rolled copper. As buckles are usually in the large flat surfaces, a few illustrations have been prepared, showing the methods which should be employed to avoid buckles. The usual method is to solder the seam at A in Fig. 1; but the hot soldering iron coming in contact with the copper expands the copper and causes the buckles. The proper way is to bend off from 1 to 4 inch flange, as shown at A in Fig. 2, and then rivet the scam with copper rivets, as shown at B. By bending the flange A in Fig. 2 on the

cornice brake it takes out the waves and no soldering iron comes in contact afterward with the copper. If a large flat surface was required, having two or more sheets in one piece, then, instead of riveting the seam flat, as shown by A in Fig. 3, the seam could be made as shown in either Fig. 4 or Fig. 5, riveting as shown.

As before mentioned, when ordering cornice copper order cold rolled cop-

chamber of furnace, and thus through the pipes and registers, it would appear that the various parts of the furnace are put together in such a manner as to be gas tight. The chimney being plastered inside and out would seemingly preclude the possibility that gas should escape through the walls, and its capacity being nearly twice that of the smoke pipe it would appear that the flue was capable of removing the prod-

Weight of Copper for Cornices.—Methods of Riveting Cornices.

per, perfectly smooth and flat and free from buckles.

## Where Does the Gas Come From?

From W. L. B. & Co., Greenfield, Iowa.—About a year ago we put in a brick set furnace for a party. It has given aplendid satisfaction as far as heating is concerned, but there has been trouble from gas in rooms directly over the furnace. The gas does not come from air chamber of furnace, through hot air pipes and registers. comes out of front of furnace or through the brick flue and plastering, but we are unable to determine which. We cannot detect much gas in the cellar, nor can we locate it in any certain place. The chimney is straight from top to bottom, excepting a jog of perhaps 11 inches at first floor, but the capacity is The chimney not reduced thereby. has a flue 9 x 11 inches, plastered inside and out. Size of smoke pipe leading from furnace to chimney is 8 inches. The question is, is the difficulty in the chimney or in the furnace?

Answer.—As our correspondents state that the gas does not come from the air

ucts of combustion after having once passed through the smoke pipe. As the gas is detected in the rooms directly over the furnace, it may be that the feed door has become warped or does not fit properly, thus allowing gas to escape after fresh fuel has been put on. It is probable the difficulty is owing to the manner in which the furnace is managed. Before opening the feed door the direct damper should be opened; then by slowly opening the feed door the gas is afforded an opportunity to pass up the chimney, providing the smoke pipe is clear of soot or ashes. If the direct damper is allowed to remain closed it is probable that when the feed door is opened much gas will escape, which, being lighter than air, will rise to the ceiling above the furnace and find its way through the openings between registers and frames to the rooms above. This gas is not liable to be detected by those in the cellar, for it is so light that it will remain near the ceiling, but as it slowly finds its way through the openings in the floor it will be noticed in the rooms

### The Tropic Hot Air Heater.

From J. S. S., Pottstown, Pa.-Can you tell me through the columns of your valuable paper where I can get the Tropic hot air heater?

Answer .- We assume that our correspondent refers to the Tropic hot air furnace, which is manufactured by the Carton Furnace Company, Utica, N. Y.

### Automatic Gasoline Soldering fron.

In the accompanying illustration we present a general view of an automatic gasoline soldering iron made by G. W. Clough, Cleveland, Ohio, who has recently applied for a patent on it. The gasoline is contained in the handle of the tool and is forced by air pressure to the burner, which supplies the necessary heat to the hooded copper point at the end of the burner. The handle is of sufficient capacity to contain fuel to last from two and a half to five

plied in a way that completely over- ! comes the difficulties hitherto found in connection with i's use. The nozzles of the burner are cup shaped, and near the bottom of the cup there is formed, internally, a small flauge. Into the nezzle there fits a small cup of wire gauze, which rests upon the flange and bears tightly against the sides of the nozzle. In this way there is a consid erable space obtained between the gauze and the point of ignition, at the top of the nozzle; and in this removal of the gauze from the point of ignition appears to lie the secret of the effective action of the burner—the gauze remains cool, and thus prevents any possibility That the of the tlame striking back. tlame does not approach the gauze is sufficiently proved by the fact that a piece of paper or the head of a match laid in the gauze cup will remain for any length of time untouched.

In a later issue of the same journal is a letter from Thomas Fletcher, the wellknown gas expert, in which he says: "The use of gauze in a fire burner, in such a position that the flame cannot touch it, and that the greater part is also protected from falling dirt, is by no means new. It will be found in a furnace burner for muttles and crucibles, shows that in every hundred families who lived on United States farms in 1890, 47 owned free of incumbrance; 19 owned, but were mortgaged; and 34 blred their homes.

#### An Iron leaf Talk.

#### BY LOSSIL.

"I'll make it hot for you," said the Fire to the Iron.

"Then I shall be down on it," said the Hammer.

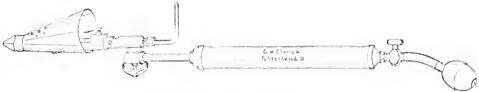

"Strike! but here," said the Anvil.
"I eateh on," said the Tongs.
"It will be colder when I get left," said the Water Tub.

"I'm going to rub my face," said the

File. "When it comes to a pinch, I'm there," said the Vise.

"Well, I'll be blowed," said the Bel-

The perfect taste that distinguishes all the publications of the Gobeille Pattern Company, Cleveland, Ohio, was never more apparent than in the latest circular which they send the trade. It

Automatic Gasoline Soldering Iron.

hours before it is necessary to refill the The tool works under air reservoir. pressure and it is occasionally necessary to pump up a pressure. The manufacturer points out that it will work in or out of doors, and is especially handy for tinners who do outside repair work, as it obviates the necessity of carrying around a fire pot and a number of coppers in order to do a small job. It is also recommended for metal pattern work, and it is stated that patterns can be gated very quickly with its use. By removing the copper the tool can be used by plumbers for thawing frozen water pipe or to keep the lead plastic while making wipe joints. Bicycle repairers, it is said, find it serviceable for cementing and taking off tires. It is also adapted for electrical work and especially useful in armature and commutator soldering. The cost in using the tool is said to be not more than 1 cent per hour. In addition to many of the uses as a soldering iron it is also adapted for use as a paint burner.

### Non-Flring-Back Gas Burners.

At the recent meeting of the Gas Institute, at London, says the Gas World, notice was given by a manufacturer that he was about to introduce an atmospheric burner for gas fires which was absolutely incapable of firing back, and which was practically noiseless in action. This statement created considerable atir in gas circles, and the advent of the new burner has been awaited with something approaching eagerness. The only new thing about the burner is the modified form of nezzle and the gauze cup; the latter being the effective agent in preventing firing back. Readers do not require to be told that the use of gauze for this purpose is not new; but in this burner it has been ap-

invented by myself over 14 years ago, the same burners now being regular standard patterns which are constantly sold. In the year 1886 I designed a modification of this burner for gas fires, and many thousands were made and sold. Notwithstanding the fact that these burners were so satisfactory for laboratory purposes, they developed defects which proved conclusively that the use of gauze in any position, in any fire burner, was a serious mistake, not to be repeated. The burners were absolutely impossible to light back, they were silent, they were efficient; and they were abandoned after 12 months' experience. It may safely be said that for gas fires the use of gauze of any kind in any position is to be unhesitatingly condemned. Although I designed a set of burners over 14 years ago with gauze in a safe position, and although these burners are being made and sold now, and are doing their work with perfect satisfaction, these burners are not used in the position or under the conditions absolutely necessary in gas fires.'

From this it will be seen that it is possible to construct a burner that will not "light back," but gauze will not prevent "lighting back" under all circumstances, and the mere insertion of a piece of wire gauze in troublesome burners will not overcome the trouble.

The American Agriculturist, in an article on "Farm Mortgages," says that the recent scare on this subject is with-The plain out foundation in fact. The plain truth is that only a little more than one fourth of the taxed acres in the country are mortgaged, and probably not one-fifth of the farms are so incumbered. The debt averages only \$8 per acre on all the mortgages, and only \$2.33 on each acre taxed. An official \$2.33 on each acre taxed. An official report on the matter, just published,

is dated Paris, September 1, and is signed by President S. T. Wellman and General Manager Joseph Leon Gobeille. The modern stove is not all that it should be from the point of artistic treatment, and it is a pleasure to learn that the work is being studied by those who are competent to grasp artistic principles and, what is more to the point, translate them into patterns for the foundry. The circular mentions visits to the famous art manufacturers of Europe, where the work itself has been studied and not the catalogue and showroom. We quote as follows from the circular: "In this manner the decoration of the beautiful percelain of Sevres, Delft and Rosenberg; the rich silver work of Hanau, Schoon-hoven and The Hague; the wonderfully effective art furniture of France and Holland, and many other artistic productions have been critically studied We have also paid much attention to the construction of stoves using fluids. gases or electricity as fuel. Many American stoves are exceedingly wasteful of fuel and much too friendly to the gas companies, little attention being paid to economy. But in these older countries 'the factor of negligence,' which cuts so much of a figure in our stove, is looked after closer, and more scientific knowledge and less haphazard is used in the original plans for accompllshing a given result.

Shipments of merchandise to the Southern States show a marked increase, both by land and water.

A report received at the State Department from United States Consul-General Williams, at Havana, shows that since January 1, 1894, the United States has taken 95.66 per cent. of Cuban sugar exports.

# TIN PLATES.

## New Tin Plate Works at Middletown, Ind.

The plant of the Irondale Steel & Iron Company, which was located at Anderson, Ird., was burned to the ground on November 1, 1983. The owners of the plant, about March 1, 1894, began to rebuild at Middletown, Ind., having secured the exclusive right to about 4000 acres of natural gas territory and also having received a very considerable bonus from the citizens of the town. The plant at Anderson was exclusively adapted to the production of light iron and steel sheets for the trade. In the erection of the new mill a complete change was made, and the plant was rebuilt as a modern tin plate mill. As such it is considered to be one of the best equipped and most modern plants in the country. The machinery was put in operation for the first time on August 31, manufacturing black plates for tinning. The mill will run for about 60 days on this product, having its output sold for that time, after which tin plate will be regularly turned

The works are located upon a mill site of cight acres, immediately adjoining the right of way of the P. C. C. & St. Louis or Panhandle Railroad, from which alde tracks have been run into the grounds, so that the handling of material both in and out is accomor material total and out to accom-plished with the least possible labor. The buildings of the plant consist of an iron mill building, 100 x 200 feet, erected by the Pittsburgh Bridge Company, covering the rolling mills, and a brick and iron building, 50 x 200 feet, covering the tin house and pickling room. The hot mills are worthy of special notice, as they are the heaviest mills that have ever been used in tin plate work. The housings weigh 22,000 pounds each, the rolls being 24 inches in diameter with 19 inch necks. The entire equipment of six hot mills and cold rolls, together with doubling shears, finishing shears and roll lathe, was furnished by the Totten & Hogg Steel & Iron Foundry Company of Pittsburgh, their Mr. Freeman being upon the ground during a large part of the construction. They also furnished a 600 horse power Etna engine, which is used in addition to the large engine transferred from the old plant at Anderson. Much credit is given the Totten & Hogg Company for the superior workmanship upon all the machinery they have furnished. The pickling machine is of the Gray pattern, but is a very considerable improvement on the Welsh machine. It was built by the Elwood Iron Works of Elwood, Ind., who also furnished the tinring pots, which are similar in general design to the Thomas & White

At present the company are rolling plates from tin plate bars, but the design of their plant contemplates the addition of a bar mill which they have already on the ground. They will then purchase 4 x 7 steel billets and draw these down to tin plate bars.

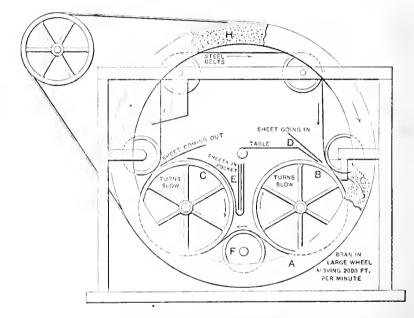

The tinning house contains eight stacks for the manufacture of bright

and terne plate. It is the intention of the company to add two more atacks specially adapted to fine charcoal plates.

The arrangement of the mill is designed to facilitate the handling of material with the least possible labor. The raw material comes in at one end of the mill, is taken to the hot mills and goes on through the mills to the pickler and cold rolls and around through the tinning house to the shipping switch, the whole system being formed in the shape of the letter U. Narrow gauge tracks are laid throughout the works.

The product of these works will be approximately 4000 boxes of 14 x 20 tin plates per week, but for the time being the tin house will not operate to

bran for cleaning purposes. Within this outer drum are other smaller ones carrying a number of steel tapes so as to form a bed to support the tin plates. The outer drum and the inner smaller ones revolve at different speeds, the result being that when the tin plate is carried around the circumference of the smaller drum its surface is thoroughly cleaned by the bran in the periphery of the outer drum. Referring to the illustration the operation of the machine will be clearly understood. Drum A is driven in the direction of the arrows at a speed of 2000 feet per minute and contains the bran, as indicated at H. This drum is driven at a high speed so that the centrifugal force keeps the

Record Tin Plate Cleaning Machine.

its full capacity, and a considerable portion of the product will be sold in the form of black plates.

The company have established their general office in room 1023 The Rookery, Chicago. This will be the head-quarters of Harold O. Crane, accretary and treasurer. The other officers of the company are as follows: George A. Laughlin, president, and John F. Whitelaw, vice president, both of Cleveland, Ohio, and L. B. Jackson, works manager at Middletown, Ind.

## Record Tin Plate Cleaning Machine.

A patent recently granted to Geo. J. Record, Conneaut, Ohio, describes a tin plate cleaning and polishing machine now in successful use by the Record Mfg. Company of that place. The essential features of the apparatus are shown in the accompanying engraving, which is a sketch of a side view of the machine with parts broken away, revealing the interior construction and the general method of its operation. The primary idea of the machine is to drive a large drum at high speed, in the periphery of which is a quantity of

bran at the outside circumference and evenly distributed. Suitable mechanism is provided for rotating the drums B and C in the direction of the arrows, which, it will be noticed, is in the same direction as the drum itself; the speed, however, of the smaller drums is comparatively alow. Between the two smaller drums is a third one, F, while at the top are two others, around which the ateel belts pass. These belts are placed about 1½ inches apart and pass over the drums diagonally, so that the portion of the plate covered by them continually about a surface in them. changes and the whole surface is thus brought into contact with the bran. The plate is introduced at D, passes around the drum B, over the smaller drum F, then around the drum C, and is finally delivered into the pocket E, the operation, it will be understood, thoroughly cleaning one side of it. From oughly cleaning one side of it. From this pocket it is taken by hand, turned over and again inserted at D, the other side being cleaned in the same manner. The manufacturers think that the machine is capable of cleaning 75 boxes of 14 x 20 plates per day by one operator. After passing through this machine the plates are put into a dusting machine,

which finishes them with a very bright surface. The cleaner, a view of which is shown in the engraving, is adapted to plates of all sizes. Another feature of this machine which has an important bearing on its practical operation is the attachment G, which is a bent piece of metal that acts as a plow and continually stirs up the bran, so that it is kept in proper condition for absorbing the grease from the plates until it is all thoroughly saturated. When that happens the drum is cleaned out and fresh bran inserted. The machine has been designed with great ingenuity, the above description only telling of its general operation and important features.

#### SCRAP.

THE ENGLISH humorous papers are generally accounted pretty dry reading, but no one can assert that there is dullness in the British press when its columns are lighted up with such amusing passages as this, which we clip from the South Wales Argus, published in Newport: "It has been scientifically demonstrated," says the Argue, "over and over again, that the climatic and geological conditions of Wales render it difficult, if not impossible, for our American cousins to compete with us in the manufacture of plates." What climate has to do in facilitating tin plate manufacture is difficult to understand, that is, unless the climate is very dry. But, on the contrary, the Welsh weather is notoriously wet and offers every inducement for black sheets to rust and finished plates to tarnish. Geologically the case is no better. Wales is a good place to make iron, but so are a dozen places in America, and until they find rich tin deposits in the Swanses district and gather palm oil from the native groves, the Welshmen had better be content to compete on even terms with the Americans. The same folly of favoring climatic and other conditions was talked about years ago in support of Sheffield made steel, and one would have thought that the ridiculousness of that claim, as proved by the growth of the American steel industry, would have prevented its being used over again in favor of tin plates.

THE TIN PLATE TRADE in the Monmouthshire valleys is reported, by the London Iron and Steel Trades Journal, to be very bad. Of the 78 mills erected there, only 34 are in operation and about 2600 tin plate workers are still unemployed, meaning a loss in wages to the district of about \$18,500 s week.

Under recent date the Phillips Tin Plate Company send out a circular to the trade announcing that they are running full time on their specialties in tin and terne plates of all grades, and will run day and night from October 1. They allude to the uniform excellencies and the heavy coating on their plates.

Dealing with the new United States tariff and its effect on the Welsh tin plate trade, the Birmingham Post, one of the leading British dailies, expresses itself candidly as follows: "Last year our shipments of this article were a little over 255,000 tons, as compared with 325,000 tons in 1891 and 336,000 tons in 1889. Something more than tariff influences are required to explain the substantial drop between 1891 and 1893, and it is probably to be found in the gradual development of the American manufacture of tin plates. During the first year or two after the McKinley tariff came into operation the domestic

manufacture of tin and terne plates in the United States was evidently passing through a probationary period; but we learn from a recent official return that during the first quarter of the current year it attained the goodly total of over 38,000,000 pounds, of which cent. was made from sheets rolled in the United States. These figures are equivalent to an annual production of 1.500,000 boxes of 100 pounds each, which represents roughtly about onefourth of the American consumption during 1893. The reduced duty may check for a time the expansion of this thriving branch of American industry, but it is hardly sufficient to destroy it. and our tin plate manufacturers will have cause to be thankful if they cau recover any portion of the ground they have lost in the last few years."

THE HENDERSON TIN PLATE COMPANY is the name of a new concern who have commenced the manufacture of tin plates at Norristown, Pa., occupying an abandoned shoddy mill, which they have adapted to their purpose. The works were started this week with 30 hands on extra heavy coated apangled terries.

THE PENNSYLVANIA STEEL COMPANY, Steelton, Pa., are erecting the new tin plate works for the Lalance & Grosjean Mfg. Company, at Harrisburg, Pa. The building is 60 x 160 feet.

The Cleveland Leader states that the Britton Rolling Mill Company of that city will start their tin plate plant very shortly. The concern were organized to manufacture tin plates, among other things, and the firm believe that the time has now arrived, with a settled tariff, to commence the industry.

F. R. Phillips of the Phillips Tin Plate Company, Philadelphia, reports a better demand for tin plate machinery, he having contracted last week for an entire new plant, and expected to close for two more this week. Every facility, we understand, is offered to see the machinery running on the finest grades of plates with different weights of coating. The plates made by this concern are, we understand, used extensively in Philadelphia, Boston and New York.

THE TOTAL EXPORTS of tin and terne plates from Great Britain last month, according to the Board of Trade returns, were 26,000 tons, against 25,000 tons in August, 1893 Of this amount, shipments to the United States were 19,000 tons, against 15,000 tons in the corresponding month of last year, which was one of exemplary dullness.

THE PROJECTED TIN PLATE WORKS of the Emlyn Steel & Tin Plate Company, at Summitville, Ind., have not been built. The buildings and machinery were ordered, but an obstacle was encountered in making the financial arrangements before the buildings were erected, and the makers of the machinery sold it to other parties. The incorporation of the Madison Tin Plate Company of Chicago by some of the projectors of the Emlyn Company would seem to indicate that the latter had been abandoned

The Elliwood Tin Plate Company, Ellwood City, Pa., manufacturers of tin and terne plate, have recently let a contract for a new tinning house, which will measure 50 x 100 feet in size and contain ten tinning stacks. In addition to this building the firm will put up an assorting room and pickling room in two separate buildings of about 30 x 40 feet in size. The firm have

placed orders for two Morewood tinning sets with the Lloyd Booth Company of Youngstown, Ohio, and two Thomas & White sets with the Union Foundry & Machine Company of Pittsburgh, with which four machines it is their intention to make a start coating their product of black sheets, while they will gradually equip their tinning house to its full capacity as soon as conditions warrant this step being taken.

AT A CONFERENCE held in Pittsburgh on Thursday, the 6th inst., between the Executive Committee of the Tinned Plate Manufacturers' Association of the United States and a Conference Committee from the Amalgamated Associa-tion of Iron and Steel Workers, a proposition was received from the manufacturers, in which a request was made for an average reduction in wages in tin house labor and in sheet mills making sheets for tinning purposes of 25 per cent. A long discussion was had, lasting six or seven hours, and this proposition was finally submitted to M. M. Garland, president of the above organization. Mr. Garland will send the proposition to the different lodges in the Amslgamated Association that are affected, and a vote will be taken as to whether to accept it or reject it. It is expected to hear from all the lodges on the matter not later than the 20th inst., after which date another conference will be held with the manufacturers as soon as it can be arranged. It is the general impression that the employees will refuse to accept the proposed 13duction.

RAPID PROGRESA is being made with the building of the Morton Tin Plate Company's plant, at Cambridge, Ohio. Ground was broken August 20, and the foundations are completed for three hot mills, three cold rolling mills, and all foundations are built for boilers, picklers, shears and other machinery. A bed of fine sand stone, 12 feet in thickness, was found on the property shortly after its purchase by the new company, and has been largely used in the foundatious. It is expected that the rolling mills will be in operation by December 15. Steps will then be taken toward the crection of the tinning departments.

THE BLACK DIAMOND TIN PLATE WORKS, Philadelphia, are reported to be running along in good shape and turning out a satisfactory product. Temple & Lockwood, 12 Platt atreet, New York, agents for the works, find a very good market for the Black Diamond high grade roofing plates in this and neighboring districts, where the good qualities of these home made plates are becoming recognized.

Canadian trade returns for the month of July show a considerable falling off as compared with the figures for July of last year. The value of exports was \$11,451,527, as compared with \$12,683,597, while imports declined from \$10,692,637 in July, 1893, to \$10,058,226 in July of this year. The duty collected exhibits a decrease of over \$250,000.

The statistics of the Financial Chronicle place the American cotton crop of 1893-94 at 7,527,211 bales, an increase of 810,089 bales over that of the previous year. Compared with the average of the seven previous crops, last season's yield shows an increase of 72,910 bales. The new crop will, it is estimated, exceed this good showing by quite 1,500,000 bales.

## STEAM AND HOT WATER.

# Heating Philadelphia County Prison.

The plans and specifications for the erection of a prison for Philadelphia County, at Holmesburg Junction, Pa., were drawn in 1887 by Wilson Brothers & Co., engineers, architects and consulting engineers, Drexel Building, Philadelphia, and were accepted. The preparation of the grounds and the erection of the foundation and the comple-tion of the building up to a point where the heating plant would be required occupied the time of the con-tractors until last fall. The original plans and specifications for the heating and ventilating plant were drawn by Cuarles G. Darrach of the above firm, and its installation during the past year under his supervision required changes to make it a model heating plant, except in such minor details as are usually found necessary in the installation of any large work. The contract for the heating plant was awarded to the Edge Moor Iron Company of Wilmington, Del, who sublet a portion of the work to Clarkson, Scott & Co., engineers and contractors, 118 Custem House place, Philadelphia, Pa.

Fig. 1 shows a general plan of the grounds and buildings. A wall 4 feet thick and 32 feet high surrounds the grounds, which have a frontage of about 900 feet and are over 800 feet deep. The walls are built with rounded corners on the inside to prevent the possibility of escape by the prisoners climbing up the corners by wedging themselves in the angle. At the front of the grounds the wall in the middle is carried back in a curve sufficiently to permit the administration building to stand outside the wall on the grounds proper and yet back of a line of the front wall, as shown in the plan, Fig. 1. At the center of the curve, behind the administration building, is the guard house, and in the northern corner of the grounds is the hospital. The prison proper consists at present of six wards, radiating from a central rotunda, the plan of the prison being such as to permit the erection of four additional wards, should they be necessary. In-stead of a ward leading from the rotunds to the back of the grounds there is a corridor which leads to the supply building. The rotunda is 80 feet in diameter and 45 feet in hight. The corridors leading down the wards between the cells intersect the circle of the rotunda, so that a sentry standing in the center of the rotunda may see to the extreme end of each ward. The prison at present has 440 cells, each one provided with a separate heating flue and exhaust ventilating duct, and each ward has a ventilating shaft midway of the ward, into which all of the ventilating ducts connect. These venti-lating shafts are 5 feet in dismeter and 50 feet in hight, with an interior circular shaft  $\xi_{\frac{1}{2}}$  inches thick, built of brick, which is inclosed in a shaft  $\xi_{\frac{1}{2}}$ feet equare, the walls of which are 12½ inches thick at the bottom and 8½ inches at the top. The steam for the heating plant and power for all of the buildings is furnished by three Galloway boilers, located in the southern corner of the supply building. Each of the boilers has a capacity of about 200 horse power, and they were installed under a guarantee to evaporate 104 pounds of water from a temperature of 212° for each pound of combustible, and at the test, when the heating plant was accepted, they showed a very substantial excess of evaporating power over this requirement.

Fig. 2 is a plan of the boiler room with the boilers at the left, with the piping, water supply, feed water heater,

of them for the engine, dynamo or for heating. An 8 inch steam main runs from the dome of each of the boilers into a tee, from which an 8-inch pipe with an intercepting valve connects with a high pressure main, and from the other side of the tee a pipe runs with an intercepting valve connecting with the 12 inch low pressure main, as shown in the illustration, Fig. 2. Fittings are placed on both of these mains for connecting two additional boilers of the same type when the additional prison wards are built. At the opposite side of the boiler room great care has been

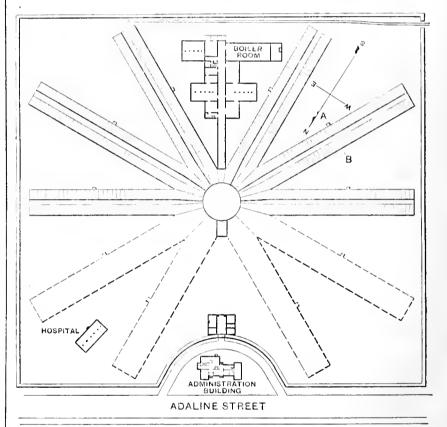

Fig. 1.-Plan of Grounds and Buildings.

### HEATING PHILADELPHIA COUNTY PRISON.

hot well to receive the return condensation from the heating system and the pumps at the right. Fig. 3 is an eleva tion showing the boilers, pumps, &c. The boilers are so set that after the products of combustion leave them pass down under and along the bottom of the boilers to the outlet immediately under the front, which is controlled by a damper leading into a horizontal flue 4 feet 6 inches wide and 4 feet 6 inches high, with an arched top. This flue leads horizontally to the main smoke stack, which is 150 feet in hight. A Blake hydraulic regulator is used in connection with a damper placed in this horizontal flue before it connects with the vertical flue, and regulates the draft according to the pressure carried on the boilers, and the amount of work required

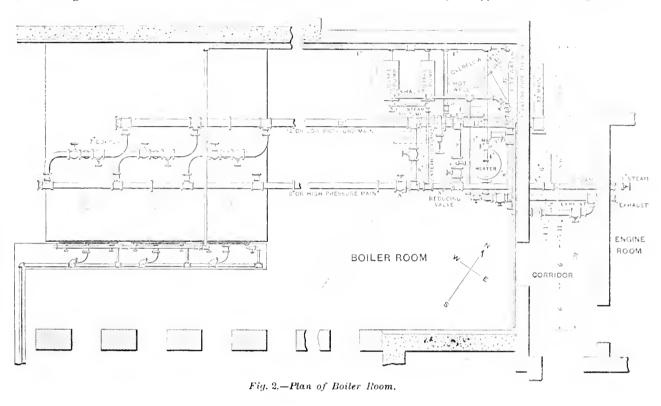

taken in connecting these two mains, and valves have been so placed that either may be used for the entire system, the valves used being those of the Fairbanka Company. The pressure main continues across the corridor to the engine room to supply the engine and dynamo and the pipe is arranged to utilize the exhaust.

The water supply is so arranged that the boilers may be supplied by city pressure when necessary, or water may be pumped direct from the hot well to the boiler, or may be forced through the water heater. By a system of bypasses the water in the water heater may be heated by exhaust steam, or from either the high or low pressure mains. A 6-inch vapor pipe runs from the hot well to the roof and a pipe runs

from the hot well to a blow off well just outside of the building at the south corner. A blow off pipe from the boilers runs to the same well. A reducing valve is placed in the connection between the pressure and heating mains to regulate the pressure, when for any reason the high pressure main is used for heating. The 12-inch heating main makea a right angled turn outside the boiler room well. A 6-inch branch is taken from the pressure main, after passing through the wall, and carried along the corridor which leads

connecting into a 10 inch circular main. The circular main is a very fine piece of pipe fitting, being constructed by the aid of special flanges. The pressure main terminates in an octagon of 5-inch pipe, which extends around the rotunda cellar. A 3 inch branch is taken from the pressure main and runs over to the hospital building. A accond 3-inch branch is taken from the pressure main and runs to the guardhouse, and is extended to the administration building outside the prison wall. Both of these pipea were laid on the Holly system,

for heating was done by Clarkson, Scott & Co. The rotunda is heated by Bundy Princess radiators located on the floor, and the entrance hall and the library above are heated in the same way, all of these radiators being connected with the 10 inch heating main. There are about 900 square feet of radiation of the Bundy Princess pattern used in heating the rotunda. From the 10-inch heating ring at the rotunda a 4 inch heating main is carried down each side of the corridora for heating the cella to a point opposite the ventilating shaft at

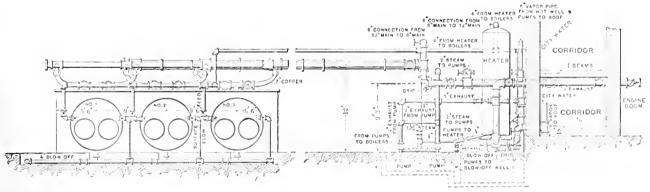

Fig. 3.—Sectional Elevation of Boiler Room.

### HEATING PHILADELPHIA COUNTY PRISON.

to the rotunda, a distance of about 300 feet, expansion joints being placed in the mains to provide for the expansion and contraction of the pipe. A novel hanger has been constructed for supporting the pipe. It consists of two bars attached to the girders of the arch of the corridor to form a support for two pieces of 1-inch round iron, on which rest two bearing bars to which are connected the straps which pass around and support the pipe. By this means the hangers rest on rollers and any movement due to expansion or contraction is free.

Both the heating and pressure mains terminate in a circle under the rotunds, as shown in Fig. 4, the 12-inch main

which has been found very satisfactory in this case. Where the 12 inch heating main connects with the 10-inch circle a valve is placed on each side, and from the bottom of the connection a drip pipe is taken to a McDaniel trap. Around the base of the cellar in which the heating mains are located a 4-inch return pipe is run and from each end the pipe is continued full size back to the hot well in the boiler room. A drip pipe is taken from the pressure octagon on each side of the main connection to it, both of which run into a McDaniel trap which is placed on the 4 inch return. The piping, up to this point, was done by the Edge Moor Iron Company, and all of the other piping in the building

the line A.B., on Fig. 1, a distance of about 150 feet. Here the heating mala branches into two 3-inch heating mains, one of which extends to the extreme end of the ward, and the other extends back toward the rotunda till it re ches the warden's office, which is just inside of the corridor. Expansion jointa arc placed in the 4-inch main a few feet inside of the ward, and on the 3 inch mains midway between the end and where they councet with the 4 inch main. A 14-inch pressure main is taken from the pressure ring in the rotunda, extending to the ventilating shaft shown at A B on Fig. I, and connecting with 400 square feet of Bundy extended loop radiation placed in the ventilation shaft to create an upward air current. A  $2\frac{1}{2}$  inch return main runs from the extreme end of the ward back to a McDaniel trap located just inside of the ward, which, in turn, is connected by  $2\frac{1}{2}$  inch pipe with the 4 inch return main inside of the rotunda. A McDaniel trap is placed where the return from the ventilating shaft enters the corridor, and in turn is connected with the  $2\frac{1}{2}$  inch return main.

from out of doors by means of a register placed in the outer wall connecting with a 10-inch cast iron plpe, which in turn connects with a 10-inch terra cotta pipe which leads to a point just below the radiator, at which point is fixed a damper for controlling the air supply. At the bottom of the cell a register is placed which connects with a foul air shaft,

are lighted by means of a skylight set in a cast iron frame, the opening being 5 inches wide and 4 feet long. From a central point the frame work flares so that the base of the cast iron frame at the top of the ceiling is 2 teet wide, while at the top, above the roof, the glass is 18 inches wide. The glass sets in a hinged frame with a lever extending down into the cell, so that the prisoner

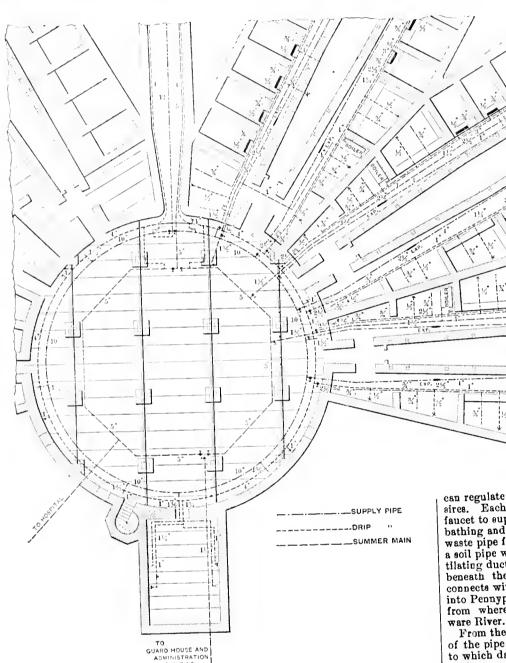

Fig. 4.—Showing Piping Under Rotunda and Wards.

### HEATING PHILADELPHIA COUNTY PRISON.

A cross section of the corridors and cells at the line A B, on Fig. 1, is shown in Fig. 5. In the basement a central air tight duet extends the entire length of each ward under the corridor with passageways on each side. In the passageways are located the heating and pressure mains and returns previously described. Beneath each cell is located 50 square feet of Standard indirect radiation, inclosed in a galvanized sheet iron box, with an 8 x 8 inch warm air flue leading to a flue of the same size, which discharges warm air into the cell near the celling. The indirect radiation is supplied with air

which leads to the ventilating duct beneath the main corridor. The end of the duct which opens into the corridor is provided with a sliding damper for regulating the amount of ventilation. Midwey of the ventilating duct at the line A B, on Fig. 1, an iron grating, 5 x 8 feet, is placed in the floor to connect with the duct, which is 5 feet high by 7 feet wide, leading to the ventilating shalt, and which is controlled by a damper.

Automatic air valves are used on the radiators throughout the entire plant, and all of the piping is covered with magnesia sectional covering. The cells

can regulate the supply of air as he desires. Each cell is provided with a faucet to supply water for drinking and bathing and a hopper water closet. The waste pipe from these fixtures leads to a soil pipe which runs through the ventilating duct to a sewage well located beneath the rotunda, which, in turn, connects with a sewer which discharges into Pennypack Creek, a short distance from where it empties into the Dela-

From the fact that the greater portion of the pipe work was done in corridors to which daylight cannot enter, the use of lamps and lanterns was necessary throughout the entire installation, which naturally made the work expensive. The heating plant was installed under a guarantee that it should be satisfactory to the architects and engineers, which was considered more satisfactory to all concerned than a guarantee to maintain a temperature of 70° in zero weather and the withholding of a portion of the money until the weather was such as to permit the fulfillment of the conditions. In making the test the average velocity of the air entering the hot air registers was 270 feet per minute and the temperature about 140°, which changed the air in the cell about four times per hour, and no difficulty was experienced in maintaining a temperature considerably above 70 after the plant had been in operation some time.

When the boilers were first fired and the plant put in operation, no material rise in the temperature was noticed for several days, due to the fact that so much solid mesonry had to be heated and dried, which absorbed a great deal of heat. The outside walls were 21 inches thick, the walls between the cell and the corridor being of the same thickness, while the walls between the cells were 17 inches thick, and the thinnest part of the arch forming the roof of the cell was made of bricks and concrete work, 12 inches thick. The

ber 1. They will be pleased to receive catalogues and quotations from the trade in general.

#### A New "American" Radiator.

The American Radiator Company have just added a new radiator to their already very large assortment, which they will call the Detroit Fine Renaissance. An illustration is herewith given, and is a handsome specimen of the high

illustrations will be promptly mailed to all steam fitters addressing the American Radiator Company, 111 and 113 Lake street, Chicago.

#### HEATING NOTES.

THE CARD AMENDAR for the month of September in the series that is being sent out by M. Mahony, Troy, N. Y., is suggestive of the season in that it represents a sportsman with his dog

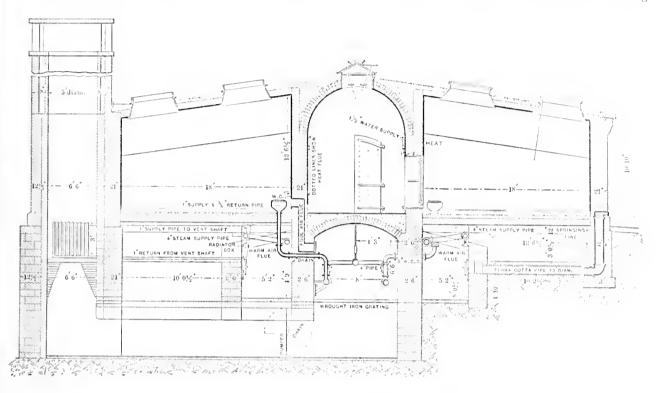

Fig. 5.—Showing Cross Section at Line A B on Fig. 1.

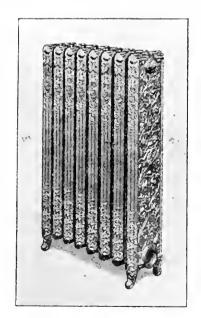

#### HEATING PHILADELPHIA COUNTY PRISON.

floor of the cells was 12 inches thick at the thinnest part of the arch which supported them. At points where the arches intersect, in some cases, the masonry was as much as  $3\frac{1}{2}$  feet thick. After this mass of masonry had onee been dried out, a fall of from  $30^\circ$  to  $50^\circ$  in the outside temperature was not felt in the cells for several hours, or even a whole day. The test made was in every way satisfactory, both to Wilson Brothers & Co. and to the authorities, as well as to the heating contractors, the Edge Moor Iron Company, and the aubcontractors, Clarkson, Scott & Co.

The hospital on the grounds is heated by an indirect system, and has, a very efficient exhaust system in connection with a large ventilating shaft, similar to that described in the prison plant. The guardhouse and administration building are heated by a combination of the direct and indirect systems.

C. D. Moore has resigned his position as secretary of the Westfield Heating & Plumbing Company, Westfield, Mass., and formed a partnership with A. N. Sprague, who has been connected for many years with H. O. Sprague & Sons. The new firm will be known as Sprague & Moore, and will carry a large line of hardware, paints, oils, ranges, &c. They will also do heating, plumbing and general jobbing. They have leased the old stand of G. B. Gaylor, 49 Elm street, Westfield, Mass., and expect to be ready for business by Octo-

grade work for which this company are famous. The Detroit Flue Renaissance is 38 inches high, and each loop con-

A New " American" Radiator.

tains 7 square feet of all-cored prime heating surface. The width is 8½ inches, and when estimating the length each section occupies 3 inches. Handsome

going through the fields. Modest reference is made to the Mahony boiler.

Nealon & Farnon, Paterson, N. J., were awarded a contract for heating the new municipal buildings in that city, their contract price being \$9541. The same firm were also awarded the lighting contract for \$5136.

Roswell Kay and John W. Peck have succeeded to the ateam and hot water heating business of J. W. Peck and the stove, tinware and metal working business of D. Dewey & Son, Montpeller, Vt., and will occupy the entire building at 60 Main street. The stove and furnace work of the new firm will continue under the supervision of F. D. Dewey.

HERENDEEN MFG. COMPANY, Geneva, N. Y., are sending out illustrated circulars relating to the Furman Junior hot water and steam boilers of their manufacture. The goods are thoroughly illustrated by means of half-tone engravings, descriptive particulars are given, and tables of dimensions and price-list.

The A. A. Griffing Iron Company are distributing from their branch office at 34 Dearborn street, Chicago, a very fine catalogue of the Bundy radiator.

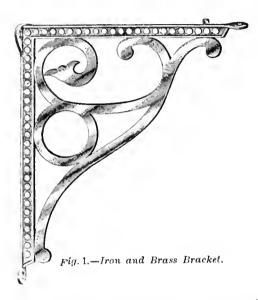

British Board of Trade returns for August show that the imports decreased \$18,128,000 and the exports decreased \$4,360,000, as compared with those of August, 1893.

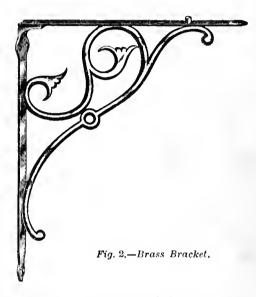

# PLUMBING and GAS FITTING.

Union County, N. J., Master Plumbers.

The master plumbers of Union bunty, N. J., including Elizabeth. County, Plainfield, Cranford, Summit, Rahway and Roselle, met at the Young Men'a Association Hall, Elizabeth, on the Iron brackets are furnished in japan, hardware bronze polished and nlckel plated, and the brass brackets are polished, also nickel plated. The design illustrated in Fig. 2 is made in the same sizes, of brass only, and is furnished both pollshed and nickel plated. The brackets are designed for use in

continuously or at intervals without the labor of turning the gas up or down or the annoyance of finding the water at an undesirable temperature. The boiler illustrated is intended to stand on the counter inside the urn, and is connected with the water supply and with the gas. The regulator is adjustable and may be

evening of September 5, in response to the call of National State Vice President of New Jersey John Hickman.

The meeting was called to order by Mr. Hickman, who, after stating the objects of the meeting and very forcibly pointing out the needs of organization, introduced National President John Mitchell. Mr. Mitchell, in his usual careful and deliberate way, impressed the master plumbers present that it was to their interest to form an association for trade protection and more friendly feeling among members of the craft. Wm. J. McDermott of New York was introduced and concurred in all that had been said, and in addition went over the work of several well-known associations which are receiving such excellent protection, and explained how the master plumbers of Union County might receive similar benefita.

The association was organized with 14 charter members, and the following officers elected:

President, Jno. H. Carney, Plainfield.

Vice president, Jos. L. Whelan, Elizabeth.

Treasurer, A. B. Winans, Elizabeth. Secretary, Wm. H. Addla, Plainfield. Strenuous efforts will be made, and it is believed with auccess, to enroll every master plumber in the county. Mr. Hickman is a very earnest and succesaful worker.

#### Brackets for Plumbers.

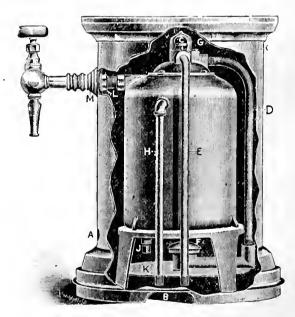

Ette & Henger Mfg. Company, St. Louis, Mo., have recently added new designs to their line of brackets for plumbers' work, as shown in the accom-panying cuts. The bracket shown in panying cuts. The bracket shown in Fig. 1 is made in iron and brass, in sizes 5 x 7, 7 x 9 and 16 x 18 inches.

connection with marble slabs, sinks, closet tanks, &c. The two smaller sizes of both iron and brass are packed half a dozen in a paper box, while the 16 x 18 inch sizes are put up one dozen in a wooden case.

#### Rowe's Automatic Hot Soda Apparatus.

We show in the accompanying illustration a broken view of an automatic

set for the delivery of water at any temperature. The attendant merely has to draw the water as desired, the whole operation being automatic. While the water is being drawn the apparatus turns up the gas and as the water heats gradually turns it down to the lowest burning point, at which it remaina until more water is drawn. Referring to the illustration, in which the parts are lettered, F is the gas burner supplied by the pipe D, G being the

Rowe's Automatic Hot Soda Apparatus

hot sods apparatus manufactured by L. L. Rowe, 18 Howard atreet, Boston, Mass. The purpose of this apparatus is to furnish water at a given temperature is lighted through the opening A. The

adjuster for the gas supply, which enters through E; C being another adjuster to regulate the heat. The burner

boiler, finished in niekel plate or silver, is tinned inside and tested to 300 pounds pressure. The boiler is also made in sheet iron easing for barbers' use.

#### Gas and Gas Fitting.— VIII.\*

BY J. W. HIGHES.

#### Putting Up Fixtures.

When the building is nearing completion the gas fitter will be called up to attend to the hanging of the gasaliers, putting up brackets and connecting gas stoves and fires. Should it devolve upon him to assist in the selection of the fixtures he must be guided by the requirements of the case, not only as regards the lighting, but also the suitableness of the different fixtures, forming as they will very prominent parts of the furniture and decorations of the

apartments.

In large centers such work is usually attended to by the architect, decorator or cabinet maker, but in small towns the average customer will appeal to his gas fitter for assistance. It will be impossible to lay down definite rules for guldance in such eases, but certain general principles must be kept in mind. Small rooms, such as up-stairs sitting rooms or boudoirs, will require lighter fixtures than the larger rooms, such as parlors and dining rooms. The fittings must also be somewhat in keeping with the general style of the house finish and decoration, both as regards color and style. It by no means follows because only one light is required in a room that a single light gasalier must be selected. A two, three or four light lamp in many cases will be much more suitable as being more symmetrical and appropriate to its general surroundings. Should a fixture be required for the newel post of the stair it must be in keeping with the general style of the post of which it will form a part. Swinging brackets must never be selected to go on wooden partitions or be chosen for places where they are liable to be swung under shelves or against doors or other wood work. For closets and similar places an ell cock, screwed onto the nipple, will generally be found to fill the bill, &c.

The length of gasaliers is an impor-tant matter. Hights of ceilings must be taken, measuring from the bottom of the center to the floor, it being usual to hang gasaliers in ordinary apartments 6 feet 4 inches clear of the floor. For halls 6 feet 6 inches is a general hight, for mirror lights 6 feet 2 inches and in stores fixtures generally hang 6 feet 6 inches to 7 feet clear of the floor. Some judgment must be used in even so simple a matter as this. In rooms where people are going to dance 6 feet 4 inches would not be sufficient, as a tall man might in dancing strike them. Fittings that have to supply light for reading, sewing and similar occupations require to be lower and nearer the work than if required for occupations

requiring less light.

The gas fixtures having been selected and made to length it is the fitter's duty to see that they are tight. This is done with sufficient exactness for small fixtures by exhausting the air by means of the lungs, and if the tongue adheres firmly to the fixture after the air has been sucked out the fixture may

be accepted as tight. But it is not sufficient to merely feel that the tongue adheres, a short interval of time must be allowed to elapse before the tongue is removed; as, for a very small leak, adherence will take place at the moment, but the entrance of air by the leak will speedily release the talking organ. Having made sure the fixture is tight next make certain there is no stoppage in it. The simplest way of doing this is by blowing through it, not with all the cocks open, if it is a tixture of several buruers, but shutting off all but one, then shutting the one tested and opening another until all have been tried.

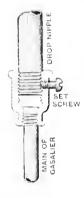

Gas fixtures should be put together with gas fitters' eement, which is a sort of rough sealing wax, made as follows: Take 4½ parts of good clear rosin, 1 part beeswax, 3 parts venetian red. Melt and thoroughly mix. Then run into sticks on a marble slab or piece of lron or any similar substance, to which it will not adhere when cold. It is applied by thoroughly warming the parts on which it is to be used to such a temperature as will cause the cement to flow freely. Then apply by rubbing an end of one of the sticks to the heated parts and screw up while hot. The spirit lamp and blow pipe are generally used for heating. It was at one time customary to use gas fitters' cement in putting together the pipes in a build ing, and it may still be the custom in some places. The objection to it was the time it took, the greater eare required and the brittleness of the joint after being made. Heavy swinging brackets that are liable to turn down if swung to the right side for unscrewing are best put onto the nipples with cement, or, better still, a back plate can be used, which will be screwed to the wall by ordinary wood screws, and the bracket screwed to the plate by a pinching or set screw.

Having made sure that the fitting is both tight and clear, next put on the burners or jets. Sec that they are set straight, and if the burner is to serve as a fastening to the globe holder or gallery, see that the thread on the fixture is long enough to allow the burner to be well and safely screwed on. This is another place where great care must be used to prevent an escape of gas, and cement does not answer the purpose, as the burners will, in most cases, get hot enough to melt the cement. Good red or white lead, so mixed that it will not run, is best for use at such joints. Specially made washers can also be had which serve the purpose admirably, being set at the base of the burner. When an escape of gas is complained of after the gas is lighted, it will be found in many cases to come from the joint at the base of the burner, sometimes in sufficient quantity to smell badly, but in too small a quantity to light. The fitter must not suppose because he cannot get a flame at a joint that it is perfectly gas tight, as a keen nose will find an escape sufficient to cause a very unpleasant odor in a room, when the gas is not escaping enough to light on the application of a flame. Set the jets in the burner so that the flat part of the flame will be toward the direction in which it is desired the light shall travel.

The burners being on you are now ready to haug the fixture, as it is called—that is, to acrew it to the drop. The drop must be cut to a proper length in order to have a neat joint at the ceiling, properly covered by the ceiling piece, leaf or cap forming the top of the fixture. Screw up the fixture

tirmly, and caution the people of the house against twisting it for a few days until the red lead has become properly set, unless cement has been used, which will make a rigid joint as soon as cold. Very large fixtures should further be made safe by having a set screw run through the top socket, which must be set tightly against the pipe, as shown in Fig. 26.

Having screwed up the fixture, see that it hangs straight (plumb), and don't leave it until it does, See that the arms are parallel with the body, or rather stem, of the fixture; that the globe holders are set level, and that the ornaments generally are in proper position and have not been disturbed by the hanging up operations. In putting up large fixtures it is sometimes of advantage to strip them of a portion of their ornaments, such as chains and pendants, and trim the fixture after the stems and arms Having the fixture in position, are up. the last thing to be done is to put on the globes. See that they are firmly secure, so that a jar or shake will not knock them off. When all the fixtures are up turn on the gas and go over the burners, lighting every one. See that they are properly set as regards the flame; that they are clean, giving a flame of perfect

Gas and Gas Fitting.—Fig. 26.—Set Screw Fastening.

shape, and, above all, that the flame does not come in contact with the globes.

In putting up fixtures in low ceiling rooms, smoke bells had better be suspended over the jets. When this is done it is best to have them secured by suitable devices to the fixture, as it is not always possible to get a holding for a screw in just the right spot on the ceiling. When they must be suspended from the ceiling use very thin screws that will go into a lath without splitting it. Nearly all English made gasaliers are provided with a ball and socket joint at the top, the American praetice being the reverse, except for special fixtures.

Ball and socket joints should be provided for all large fixtures. When used see that they are well greased with good tal'ow, and secure them to the nipple with a set serew. Also see that the two parts of the ball joint are secured with a set screw, as ball jointed fixtures are supposed to be moved and turned about, and unless firmly secured by set screws an ignorant or careless person is very apt to unscrew them by turning the wrong way. They should always be turned in the direction that would screw up or tighten the joint, should it happen to be loose. The set screw precaution is especially necessary when crystal gasaliers are in question. A weak apot in crystal gasaliers is the plaster setting—that is, where the crystal parts are set into the metal, plaster of paris being

<sup>\*</sup> Copyrighted, 1894, by David Williams.

usually employed for making the joint. Rooms in which old crystal gasaliers are hung are apt to smell of gas. This will generally be found to preceed from the setting. In time the gas saturates the plaster and is given oil in many small but distinctly perceptible quantities. It is semetimes possible to cure the trouble by carefully painting around the setting with white lead or white shellae varuish, but when fixtures get into the aforementioned condition, they should be taken apart and the joints reset.

Having used sure that all your burners are right, fitting plumb and level as the case may be, ornaments in place, and that no red or white lead is in evidence where it should not be, no finger marks on the fittings or globes (I take it for granted that the fitter has not marked the walls or ceilings), and that all litter has been cleared up, it is in order again to test the job. This time it may be done by means of the meter. Mark the position of the index on the meter dial—the top dial on the metal index (see Fig. 27). This dial

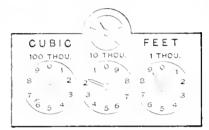

Fig. 27.-Meter Dial Plate.

and pointer serve to mark the single feet and parts of feet of gas passing through the meter and the pointer travels comparatively fast. If its position is marked, and all cocks being shut, it is left for a short time, say 15 minutes or half an hour, and it remains in its position as marked, the job may be passed as tight. It is well in new work to test the meter by opening one or two cocks and lighting the burners in order to see that the meter is in working order, and watching the indicator hand. Also light up all the gas at the same time in order to ascertain that there is a free delivery of gas in sufficient proportion at each burner.

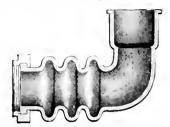

#### Gas Logs.

The gasaliers and brackets being connected and tested, it is next in order to attend to the connections for the gas fires and stoves. The points to be ob served are, first, as to the setting of the gas logs, or basket grates. When logs are used, or grates of the movable kind, care must be taken to have them set properly in the fire place, central as regards the width of the fire place, and far enough back to insure the free escape of the products of combustion up the chimney flue. The throat of the chimney should not be left full open, but should be provided with a metal stopper having in it an adjustable damper that can be entirely closed when no fire is used, and having a notched ratchet attachment by means of which the size of opening in the damper can be regulated.

The cocks for controlling the supply of gas to the firea must be so placed as to be easy of access when the fire is burning. They are sometimes fitted by the man who pipes the house under the flooring and outside the hearth at one side. In such cases a socket key must be provided to pass through the floor for turning the cock. Again, they may be placed above the floor, outside the fire place, at one side of the mantel.

When it is necessary to have them immediately under the grste or log, they must be provided with a key long enough to clear the front of the log or grate and be attached to the cock. Gas stoves are generally provided with cocks for controlling the different burners, but must have in addition an independent cock on the main supply to the stove for shutting off the whole apparatus. A suitable hood should be fitted over cooking burners, having a pipe connected to the nearest flue for carrying off the fumes of cooking, and when the stove is provided with a collar for yeut flue, the pipe from it may be attached to the pipe from the hood leading to the flue.

Fit keys in these pipes and try all burrers, seeing that all the heat burners give the proper heat flame (blue), otherwise they will give poor results, forming soot on the bottom of cooking vessels and giving off foul odors. When gas fires are used, requiring the white or light flame, see that all the holes in the log or fire are free, and that the gas ignites at all of them, so that unconsumed gas may not escape. imitation coal fires are used by piling lump asbestos in a grate over a suitable burner or set of burners, see that the lumps are so arranged as to give the effect of a real coal fire, and to this end, when the lumps are perforated, pilc them over the burners in such a way as to permit the gas and flame to pass will enter the horn of the bowl, when the flange will expand and hold firmly to the inside of the bowl. The lock nut is then applied with the washer in the usual way. If the horn of the closet is broken off very unevenly it is first trimmed with a cold chisel and a little white lead applied. The brass

Vanderman's Water Closet Connectors.— Fig. 1.—Expansible Connector.

tail pipe, or connector, is cut to the standard thread, and any standard lock nut and coupling will fit the connector.

#### TRAPS AND VENTS.

THE FIRM of Abden & Steiner, plumbers, Fort Wayne, Ind., has been dissolved.

AN ITEM from a Pittsburgh paper states that Plumbing Iospectors William Layden and W. T. Taggert have completed the inspection of all the hotels, restaurants and business blocks in

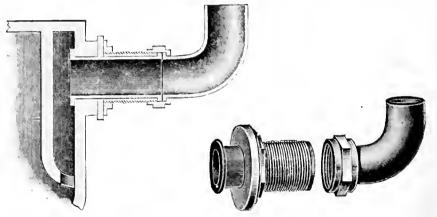

Fig. 2.—Section through Elastic Connector.

Fig. 3.—Showing Parts of Elastic Connector.

freely through the openings. A little asbestos fiber judiciously arranged among the lumps adds very much to the general effect.

## Vanderman's Water Closet Connectors.

The accompanying illustrations show new goods brought out by the Vanderman Plumbing & Heating Company of Willimantic, Conn., that will be of particular interest to the plumbing trade. Fig. 1 is a sectional view of Vanderman's expansible water closet connector, intended for connecting the flush pipe to water closets. This device, it is pointed out, will permit of a large range of adjustment between the closet and the flush pipe, and, furthermore, is adjustable in any direction. Its simplicity and utility are particularly alluded to by the manufacturers.

Figs. 2 and 3 are illustrations of Van-

Figs. 2 and 3 are illustrations of Vanderman's elastic water closet connector for repairing broken flush pipe connections. They are used when the horn of the closet is broken and it is necessary to connect the flush pipes. It is easily applied and is said to make a strong and tight connection. In using it, the flange end of the rubber connector is compressed or folded so that the flange

Pittsburgh, with the result of condemning over \$10,000 worth of plumbing, principally in hotels and restaurants.

THE PLUMBING FIRM of Stevens, McGrath & Gilchrist, 184 East Market atreet, Hazleton, Pa., has been succeeded by the new firm of Stevens & Gilchrist.

- O. A. Toner has removed his plumbing establishment to 116 High street, Oshkosh, Wis.
- C. HAVEN & Co. bave dissolved partnership. Clarence Haven of the firm retired and the business will be continued by Charles Defenbar of the firm.

THE TRADE will be pleased to learn of the marrisge of H B. Middlebrook, a well-known master plumber, of Bridgeport, Conn., which took place Thursday evening, September 6.

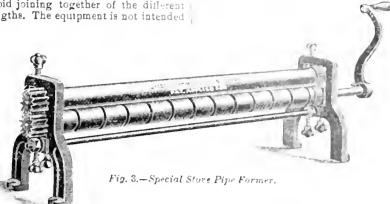

- J. J. WAFER is about to open a plumbing and heating establishment in O:tawa, Ill. Mr. Wafer has for the last 15 years been located in Denver, Col.
- A NEW PLUMBING FIRM, under the style of W. B. Chaney & Son, has opened up in the basement of the Metropolitan Block, Lima, Ohio.

#### Stove Pipe or Leader Ontfit.

Jscob Brombacher's Sons, 30 Cliff street, New York, are offering a series of machines, as shown in Figs. 1, 2 and 3, designed especially for the rapid and cheap manufacture of riveted pipe by hand and foot power where steam or other power is not available. The outfit consists of a square shear to cut sheets to the desired length; next a gang punch, illustrated in Fig. 1, which punches all the holes on one side of the sheet at once, the process being duplicated on the other side of the sheet; next of a machine represented by Fig. 2, which folds the edge on the sheet after the rivets are put in place, and is arranged so that the rivets neither fall out while the operation of folding is out while the operation of loiding is being performed nor after it is finished, as the lock is forced down on the head of the rivets, holding them in place, so that if necessary the pipe can be shipped rolled up or nested, without being riveted, to economize freight. The next process requires a specially ar-

can buy it. In addition to its being adapted to stove pipe it is available for leader pipe, and when so wanted a specially designed mandrel is sent along with a gauge, which permits of the rapid joining together of the different lengths. The equipment is not intended

and regular 30-inch squaring shear, not i'lustrated, belongs to the set. Samples of the pipe made by this method, to-

for smaller than 3 inch pipe, although, at some sacrifice in the speed of pro-

duction, pipe as small as 2 inches can be made. For pipe as small as this, how-

gether with prices and detailed information, can be obtained of the makers.

#### Bertsch's Combined Punch and Shear.

The accompanying illustration shows an improved combined punch and shear

Store Pipe or Leader Outfit .- Fig. 1 .- Gang Punch.

Bertsch's Combined Punch and Shear.

ranged machine for rolling up and crimping the pipe in one operation, and, as will be seen by reference to the cut in Fig. 3, the roller is so arranged as to allow of the rivets passing through without interference. This outfit has been tested, and is referred to as a success. While the production is not as rapid and therefore not as cheap as where power can be used, it is sufficiently rapid in results, the manufacturers say, to enable tinners of small means to

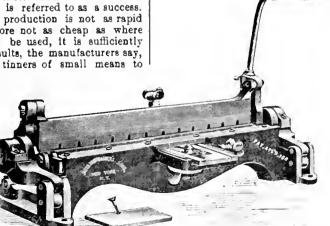

Fig. 2.—Special Fotder.

make their own pipe and supply the ever, another outfit is recommended, surrounding territory cheaper than they which is now being built. A mandrel

manufactured by Bertsch & Co , Cambridge City, Ind. It is intended for light and heavy sheet iron workers, and is made in eight sizes with 4, 8, 12, 15 and 18 inch throat punch, adapted to punch flange and angle iron, and has 8, 10, 12 and 18 inch blades to cut round or flat bar iron in sheets up to all inch plate. Referring to the illustration, it will be seen that the working parts of the punch and shear are not combined, but are independent of each other. The punch and shear are each provided with a lever socket, so that it is convenient for two to use the machine at once, except when cutting long sheets. The lever on the punch will work from the front or rear, while the lever socket on the shear has a series of holes for adjusting the knife bar links, so as to cut but half the length of blades, which increases the power, it is claimed, from 50 to 100 per cent. The knife bar has a bearing on the rear side to prevent springing. With the tool to prevent springing. With the tool are furnished three sets of punches and dies, back gauge, improved side pin gauge for punching holes at equal distances apart without marking off and strengthening bolts for the deep throat

## HEATING DO PLUMBING.

NEW WORK AND CONTRACTS.

JOSEPH ADDIS, Allentown, Pa., has been awarded the contract for putting in a steam heating plant in the Gilbert House, at Weatherley.

THE CONTRACT for heating and ventilating the new University of Cincin nati has been awarded to E. M. Link Machinery Company of Erie, Pa.

THE CONTRACT for the plumbing work in the new McCusker & Hahne Block. Danville, Ill., was awarded to King Brothers.

THE WELLS & NEWTON COMPANY, having branch (thee at 712 Union Trust Building, St. Louis, Mo., have just completed the plumbing contracts in the new Union Trust Building, and are now constructing the heating apparatus in several St. Louis school buildings, as well as doing work in residences and offices.

THE COMMITTEE ON HEATING AND VENTILATION of the Board of Education, Brooklyn, N. Y., have awarded contracts to E Rutzler of New York, for heating and ventilating schools No. 23, No. 55 and No. 88.

DE Long & Sons, Glens Falls, N. Y., has been awarded the contract for furnishing the heating apparatus for the new school building in District No. 10.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until September 28 for a disinfecting plant for the United States Quarantine Station, San Diego, Cal. Drawings and specifications may be obtained from the Supervising Architect, Washington, or from the Custodian at San Diego.

The Building Committee to whom were referred the bids for heating, plumbing and wiring the new County House at Rome, N. Y., reported in favor of the acceptance of the following bids, and the report was unanimously adopted: Steam heating, Charles H. Jackson, \$11,849; plumbing, Cahill Brothers, \$5449; wiring, William F. Bassert, \$2350.

SEALED PROPOSALS will be received at the effice of the Supervising Architect, Washington, D. C., until September 26, for the steam heating apparatus for the United States Post Office Building at Lewiston, Mainc. Drawings and specifications may be obtained from the Supervising Architect, Washington, or from the superintendent at Lewiston.

William G. Waters will begin working on the plumbing of four new houses in Fairhaven, Conn.

THE BOARD OF EDUCATION OF East St. Louis have awarded the plumbing contract in the new High School to the City Plumbing & Gas Fitting Company for \$1585.

THE SCHOOL BOARD of Lynchburg, Va., have been authorized to expend \$3000 for new heating apparatus for the school buildings.

F. O. WALKER, Mexico, Maine, will put in the heating apparatus in the new school house in that place.

FRANCIS BROTHERS & JELLETT are to make extensive alterations and additions to the heating plant at 1428 Walnut street, Philadelphia, the cost to be \$2500

THE CONTRACT for heating the new engine house on Holly atreet, South Framingham, Mass., has been awarded to H. L. Sawyer.

Among the contracts recently taken for warm air heating by the Fuller-Warren Company, 134 Lake street, Chicago, may be mentioned the following: Flat building of W. C. Swern, 1519 West Adams street; residence of W. Ander, 401 Ontarlo street; two residences at liyde Park, and an eight-toom school building at Phillips, Wis.

THE KELLY & JONES COMPANY, 48-52 North Clinton street, Chicago, have contracts for steam heating in the Colonial Hovel, Sixty-third street and Ogelsby avenue, and Robert Fulton School, State and Fifty third streets.

Amono the contracts recently taken for plumbing, gas fitting and sewerage by J. J. Wade & Son, 279 Dearborn street, Chicago, can be mentioned the following: Chicago Canal & Dock Building, 362 to 372 Illinois street; Rellance Building, 15 stories, Washington and State streets; State Safety Building, 12 stories, State street and Wabash avenue; Kent Building, ten stories, Franklin and Van Buren atreets.

E. E. Noves 584 West Lake atreet, Chicago, has the contract for the copper cornice, bay windows, skylights and slate roofing for the flat building of Mrs. J. Memhard, 1669 West Monroe street.

THE THEO. JACOBS COMPANY, 72-74 Market street, Chicago, are to iostall a hot water heating plant in the residence of William Beat, 4320 Jackson Boulevard.

James A. Miller & Bro., 129-131 South Clinton street, Chicago, report the following new contracts: E. J. Lehman estate, 475 Wabash avenue, new skylights; Mrs. H. G. Woodward's residence, Forty-eighth street and Grand Boulevard, slate roofing and copper cornices; Art Institute, skylights for studio building; Brevort House, new skylights; T. C. Wegeforth, Monroe street and Central Park avenue, slate roofing and copper work; village of Galva, Ill., slate roof on water works building.

FOSTER & GLIDDEN, 53 Desrborn street, Chicago, are to install hot water heating plants in the four houses of R. W. Roloson, Calumet avenue near Thirty-second street.

KEUM BROS. & MERTZ, 289 East Kinzie street, Chicago, have the following contracts for steam heating: Flat building of L. N. Aranto, 1648 Fulton street; flat building of J. J. Schillo, 218 Mohawk street; residence of Dr. Z. E. Patrick, Woodlawn Park.

The Grand Rapids Refrigerator Company of Grand Rapids, Mich., manufacturers of the Leonard cleanable hardwood Refrigerators, have favored us with a copy of an attractive publication entitled "Grand Rapids As It Is." The growth of this enterprising city is indicated in the fact that its population was 8085 in 1860; 32,016 in 1880, and is now 80,020. The book, which is published by the Grand Rapids Board of Trade, comprises 52 pages, finely illustrated, giving views of public buildings, office and business blocks, factories, handsome private residences, &c. It is not loaded down with details regarding business enterprises, and therefore avoids the appearance of mere advertising. A view is given of the factory of the Grand Rapids Refrigerator Company, which is shown to be an imposing structure,

six stories and basement. The book does not show either of the company's large warehouses used for storage purposes, one of which is 100 x 100 feet, four stories and basement, and the other is 50 x 275 feet, one story 24 feet high in the clear. The factory, which is illustrated, is used exclusively for manufacturing purposes and has a capacity of 50,000 Refrigerators p-r annum. The company claim this to be the largest Refrigerator factory in the world. They announce that their new styles for 1895 are especially fine.

#### The Perfection Drum.

In the accompanying illustration we show what is known as the Perfection drum, with a portion of the outside shell cut away, clearly indicating the construction of the central chamber and the air and smoke flues. The arrows indicate the points at which the coldrair enters the six tubes, each of which is 23 inches in dismeter. After passing through the central chamber the heated

The Perfection Drum with a Portion of the Outer Casing Broken Away.

air is discharged through six tubes of the same size at the top. It will be noticed that the construction of the drum is such that the smoke passes around the pipes and heating chamber. This drum is being manufactured by I. B. Kinne & Son, 208 Nicollet avenue, Minneapolis, Minn., who state that its use will save a large percentage of the heat that is generally wasted by going up the chimney, and at the same time will not check the draft of the stove in connection with which it is employed. Two sizes are offered, the 12 inch drum having, it is stated, 2302 square inches of radiation and the 15-inch drum 3076 square inches.

The extraordinary falling off in immigration into the United States this year is illustrated in the returns for the month of July last, issued by the Bureau of Immigration, which show that the number of immigrants was only 17,859, as compared with 47,719 in July of last year. The decline is most strangely marked in arrivala from Austria, Hungary, Italy and Russia. Several governments, notably that of Italy, have notified their intending immigrants of the unfavorable conditions for employment existing in all lines of industry in this country.

# STOVE TRADE NOTES.

Hon, Amos C. Barstow,

In our last week's issue the death was briefly announced of Amos C. Bars tow, president of the Barstow Stove Company of Providence, R. I., who, after an active and successful business career of over 60 years, passed away at his residence, 12 Jackson street, Provi-dence, from the effects of a paralytic stroke which prestrated him a few days previously. In the death of Mr. Barstow the stove manufacturing industry loses one of its oldest and most esteemed representatives, and Providence one of her most useful and honored citizens.

Amos Chafee Bsrstow, whose portrait

is presented herewith, was born in Providence, R. I., on April 13, 1813, and virtually spent the whole of his long life in his native city. He was the native city. He was the son of Nathaniel Barstow, and a descendant in the fifth generation of William Barstow, who, in 1636, acttled at Dedham, Mass. He received his education in the public schools, and at the age of 17 years entered upon a mercantile career as a clerk in the stove and tinware establishment of James Eames, whose eldest daughter he afterward married. In 1836, at the age of 23 years, he commenced the manufacture of stoves on his own account, at Norton, Mass., and thus laid the foundation of his fortunes. In a few years Mr. Barstow trans-Ierred his foundry to a site on Point street, Providence, R. I., and started what is now the wellknown Baratow Stove Company, incorporated under that name in June, 1859. In later years Amos C. Barstow, Jr., and others became associated with him in the

concern, but he continued actively connected with the business, as presi dent of the company, up to the time of

his death. He was also interested in other concerns, including the Builders' Iron Foundry, the New England Butt Com-pany and the Gorham Mtg. Company, and was president of the Slater Mill & Power Company, the Providence Warehouse Company, the City National Bank and the Providence Gas Company, besides being connected as director or otherwise with several other banks and industrial or beneficent institutions. Mr. Barstow's business talents and interest in public affairs early recommended him to his fellow citizens as a desirable man for public office. He was elected Mayor of Providence in 1852, besides serving several terms in the City Council as well as in the State Legis-lature, where he filled the post of Speaker of the House of Representatives

with conspicuous success. In 1875 he was appointed by President Grant a member of the Board of Indian Com-missioners, and in 1878 he was made chairman of the board, a position he held for several years, giving freely of his time and money for the improve-ment of the condition of the Indians, and making many long and arduous journeys on business connected with the commission.

His efforts throughout the whole of his prolonged life were directed toward the promotion of truth and righteousness and the betterment of his fellow men. He was an ardent advocate of temperauce, and took a leading part in the anti-slavery movement before and

AMOS C. BARSTOW.

during the war. He was prominent in church work, and was a liberal contributor to charities. Mr. Barstow was for many years a deacon in the Beneficent Congregational Church, as well as superintendent of the Sunday school. served several times as president of the Congregational Club, and was a member of the National Congregational Council. He was also the first president of the Providence Y. M. C. A., and presided over a number of other religious and secular institutions. He traveled considerably and published accounts of his voyages in the form of "Letters from Europe," "Letters from California," &c. His literary efforts, which have been printed, also include poems and articles on the Southern and Indian questions, temperance and other topics. Dying full of years and honor, Mr. Bar-stow was followed to his grave by many who regretted the loss of a revered friend and trusted adviser.

The Ohio Stove Trage.

A very conservative tone characterizes the Information received from stove manufacturers and dealers in Cincinnati and the territory embraced within a radius of 200 miles from the city as a center. All are united, however, in testifying to the dull trade and extreme depression during July and the greater part of August. Respecting the Indiana natural gas belt, business is reported to have been especially unsatisfactory, because of the unusual prostration among the manufacturing institutions. Shrink-

age in business in Ohio is estimated to be from 20 to 25 per cent. by some nanufacturers. while others believe they have suffered from 25 to 33½ per cent. From the Southern part of Michigan it is reported that there is a tendency this year more than ever to order samples only and compel manufacturers to carry the stocks. Now, however, manufacturers. with very few exceptions, are ln accord in acknowledging some improvement in the outlook end an increase in business. The improvement seems to have been inaugurated during the latter part of August, when many manufacturers placed orders for pig iron in that market. Since the opening of September the improvement has been more marked, some foundries reporting an increase of

20 to 25 per ccut. In orders, and one or two have experienced a growth of fully 50 per cent, over the volume of trade at the corresponding time last vear. One manufacturer in the North, however, dissents from this view: his orders, while being larger in number, are smaller in volume.

As a rule there is a disposition to remain extremely cautious and to avoid any accumulation of surplus stock. Dealers have held off so long, however, that they are obliged to enter the market, and as orders come in foundries which have been entirely idle or runing on half time are resuming and molders are now working full time. Late reports indicate that confidence is growing, although some manufacturers believe that the improvement will be short lived. Retailers are experiencing some l'ttle increase in sales, but are almost afraid to say so, for fear of frightening trade away; they say the army of unemployed must first find permanent work before any improvement can be substantial. One prominent and important feature in business is the demand from the South. For the first time in many seasons that section seems to be flourishing. This year they have good crops, while north of the Ohio grain, especially corn, has suffered from the protracted drought.

Dealers in ranges and furnaces are apparently receiving orders in larger proportion than for stoves, and they say beyond their expectation.

Prices are low, but the tendency is toward hardening rather than otherwise, in sympathy with raw material. Orders are quite liberally scattered, covering a wider territory than usual. Manufacturers as well as dealers allowed stocks to run very low, so that now, when orders come in for certain patterns, they are pushed to make early shipment. It is the experience of the trade that money matters are much better than last fall and more like the condition of affairs in the autumn of 1892.

#### Philadelphia Stove Trade.

That there is a better feeling in this market is evidenced by the fact that foundries are busier than they have been for some time. The larger foundries are averaging a five-day production each week, and the output of the smaller concerns shows marked improvement. In some foundries it has been demonstrated that a steady five-day production is about equal to what was formerly produced in a full week. This is attributed to the fact that there are fewer absentees among the employees when works are run on five days' time. Such being the case, it is a question whether the running will be increased.

Salesmen are returning from trips over their territories preparatory to starting on second trips. Their sales have been exceedingly light, and for the most part confined to cooking goods and furnaces, dealers deeming it good policy to hold their orders for heating stoves until later in the sesson. In the city of Philadelphia the furnace trade is brisk and is in strong competition with heating atoves, the demand for which latter is materially decreased thereby. Gae, gasoline and oil goods have been in good demand throughout the season, but refrigerators have moved slowly, and dealers find themselves with considerable stock still on hand.

The improved condition of business in general must certainly lend an impetus to the stove trade and enable a dealer to form some estimate on which to base his orders for fall stock. Many factories and plants that have been closed down are running again, and the

whom many dealers largely depend for patronage, is much improved. Crops have suffered greatly from the continued drought which has prevailed, but the better prices obtainable for produce will tend to offset the losses of farmers to a large extent. There are no strikes or labor disturbances in the sections dependent upon this maket, and there is a feeling of peaceful and growing activity prevailing which is gratifying alike to producer and consumer.

#### The Home Stove Company

of Indianapolis, Ind., have just brought out a catalogue of the cook stoves, ranges and heaters which they manufacture. The volume contains 56 pages, is profusely illustrated and bound in colored paper covers, on the second page of which is an index for facilitat ing reference. The leading place in the catalogue is given to the Model cook, a four-hole construction with sectional back wall, cemented top oven plate, large draw hearth, ball shaking and dumping grate and nickel trimmings. It is made in five sizes with ovens ranging from 11 x 16 x 16 to 13 x 20 x 20. Following this is the Model wood cook, made in a variety of styles and sizes, after which we find the Model four-hole range, adapted for burning coal. This is made in two sizes and a number of varieties. The Columbia four hole cook, a low priced construction of unpretentious appearance and embodying the modern features; the Kitchen Queen, for wood only, and made in four sizes; the New Home, for coal or wood, and the New Home range, are some of the other goods to which attention is invited. The patterns for the range have just been completed, and the company offer the stove as a first class construction of tasteful ornamentation and embodying the latest improvements. The heaters are repre sented by the Grand Oak, made in five sizes, for wood and coal; the Fair Oak, made in the asme number of sizes; the Model Oak, which is a medlum priced construction; the new air tight Model Oak, which is offered in two sizes; the new Model Franklin, adapted for gas or coal; the Home Franklin; the Home Air Tight, a square parlor stove for hard or soft coal, coke or gas; the Norman Queen; the New Cottage parlor atove; the Golden Rule Todd, a tastefully ornamented wood heater, offered in a large number of sizes; the Imperial box; the Home cannon; the Model sheet iron surface burner, and the Model gas Junior, for natural gas. The catalogue concludes with a list of atove hollow ware and trimmings.

#### The Grander Stove Company

of Royersford, Pa., have just issued a 94 page catalogue of their goods. It is well printed on a fine quality of printer and is bound in stiff paper covers, maroon colored, the front page bearing the company's name and a Bride range, the back page the company's monogram, all embossed and bronzed. The opening page contains a view of the company's works, and the four following pages are devoted to a presentation notice and a special notice embodyling terms and conditions of shipments. Page 6 opens the catalogue proper, and with nine followers covers a line of Bride ranges, most of which have

been redressed since last season. size is shown with a new high warming closet, made of heavy Craig sheet steel, with polished and nickeled iron frame and sliding doors. The Mentor, a new six hole range, la next in order, and is described as being a sheet flue range, with right or left oven door, ventilated oven, cabinet base, large fire box, automatic oven shelf, extension drop table and reversible pipe collar. Shiloh, Aline, Major, Merion, Malta, Lenor, Umpire, Iona and Junior ranges fol-low. The Junior range, with elevated boiler, presents a handsome appearance, having been redressed for this season's trade. In cook stoves the Peerless Oakland, Black Warrior and The line of Mlner's Home are shown. cooking goods concludes with the Favorite, a handsome brick set range with heavy castings and large oven. Two pages are devoted to pipe shelves and include the Venus, a new shelf, rich in ornam.ntation and attractive in appearance. Heating goods lead off with the Bride, a full revertible flue, base burning double heater, recently re-dressed. Other heating stoves are the Volga, double heater; the Mars, single heater, a direct draft or revertible fluo stove, in four sizes, which appeared on the market last season for the first time; the Milton direct draft double heater and the Milton single heater, the latter being new this sesson and pleasing in appearance, and the Beauty single heater, Topsy and Elma sheet iron stoves. A line of Globe stoves, fire place niches and fronts, four pages devoted to the Victorious portable heater and 21 pages covering gas goods, pricelists and tables complete the book.

#### ODD PLATES.

THERE ARE SOME FIRMS in every line of trade who are less doleful in times of business depression than some of their competitors, perhaps because they do not resort to the usual methods of economy and retrenchment in advertising and other expensive schemes to conform to a reduced amount of business, but who believe in an extension of such achemea to keep their business up to the normal volume if possible. spicuous among such concerns in the stove line is the Union Stove Works, 70 Beekman atreet, New York, who have added to their rolling stock a very large double truck, with high racks and gorgeously painted signs, that serves as a traveling advertisement of their house as well as a most convenient dray. new departure, too, with this firm is the adoption of a sample wagon, in which they have a few stoves, all mounted, polished and well secured, which the salesman exhlbits at the dealer's door to promote an interest in the company's goods and, if an order on the spot cannot be secured, to urge his presence at the warerooms to inspect the greater stock there displayed. The wagon, we understand is called the "prompter," and is undoubtedly a good ides in these times of business lethargy.

The death is announced as having taken place at Troy, N. Y., on Wednes day, September 5, of Mrs. P. P. Sewart, at the advanced age of 88 years. She was the widow of P. P. Stewart, the inventor of the well-known P. P. Stewart Summer and Winter Cooking Stove, manufactured by the Fuller & Warren Company of Troy. It was due to the influence and encouragement of his wife that Mr. Stewart persevered and experimented so persistently with his famous atove. Mrs. Stewart

survived her husband 26 years. She and her husband were both active in the founding of Oberlin College, and in other beneficent work. Since the death of Mr. Stewart, in 1868, his widow had lived very quietly in Troy, where, until within a very few years, she was a very active worker in her church and in other charitable and religious fields.

THE PITTSBURGH Dispatch speaks highly of the effective display of gas stoves and ranges made at the lately opened Pittsburgh Exposition by J. C. Bartlett & Co., of that city.

PRESS DISPATCHES from Reading, Pa., are to the effect that the employees of No. 1 Foundry of the Reading Stove Works began on Monday working six days in the week. For some time past it is stated they have only averaged about four days a week.

THE PALACE KING AND QUEEN FUR-NACES are the subjects of a 16-page pamphlet just issued by A. Bradley & Co., 200-202 Wood street, Pittsburgh, Pa. The goods are illustrated in such a way as to show the internal arrangement, and accompanying the engravings are tables giving the sizes made, dimensions and capacities, together with prices. Attention is also invited to the Palace King hot water boiler with and without nipple connections, and also to the Etna stovea and ranges. A long list of references occupy the closing pages of the pamphlet. The manufacturers state that their lines of heaters are arranged for high or low cellars, are simple in construction, have few joints and no bolts, are heavy and durable and free from gas and dust.

THE SILL STOVE WORKS of Rochester, N. Y., favor us with a four-page folder carrying "A Few Words to the Stove Merchant." By way of introduction brief reference is made to the general merits of the Sterling line of ranges, and attention called to the fact that a new range has been brought out. This is of handsome appearance, the ornamentation being rich and tasteful, and the constructive features of the most approved pattern. Among other points may be mentioned the fire box, which is extra large, oval in form and has an extra heavy brick lining, which is held in place without the aid of a bolt or fastening. It rests upon a special frame independent of the grate frame. Another feature is the company's patent lift hearth, which is raised up instead of awarg to one side to permit the removal of the ash pan. The oven is of large size and is fitted with the makers' transparent ventilating double oven door. Other features are referred to in such a way as to interest the dealer. who is asked by the company to read the folder from beginning to end, as it will be to his advantage so to do. A second folder is intended for the housekeeper and refera to the merita of the Sterling range.

The Salesman Repurt Book Company of Potiatown, Pa, have just brought out a copyrighted book intended for the use of traveling salesmen and referred to as being applicable to any line of business. A sample page of the book which is before us measures  $6\frac{1}{2} \times 9\frac{1}{2}$  inches and carries printed questions with blank spaces to be filled in by the salesmen. We understand the object of these repurts is to furnish the offices of any or all manufacturers and business houses with accurate and correct information concerning persons visited by their salesmen. The printed sheet calls for the travelet's

estimate of the character of the dealer in all its phases, his report of the goods handled by that dealer, and his estimate of the dealer's worth, standing and eredit. It also calls for many other items of information looking to the building up or increase of trade with that dealer and covers any special prices given and any settlement made. In using the book the traveler makes his report on every business house visited, and the report is filed away in the office for future reference. The secretary and treasurer of the company is H. M. Ebert, Pottstown, Pa.

"A LITTLE LIGHT ON A 'New 'DEA'" is the title of a booklet which is being distributed by Schill Brothers of Crestline, Ohio. Our readers will doubtless recognize the fact that New Idea is the name of the line of furnaces which the firm manufacture, and that the pages of the little book are devoted to an exposition of the merits of this heater. The story is told in verses, each of which occupies a page and is accompanied by an appropriate picture. The firm are made up of six members of the Schill family, and are claimed to be "the largest family making furnaces in the United States."

THE ENTERPRISE STOVE COMPANY of Vincenres, Ind., are distributing to their friends in the trade a cordial invitation to be present at the Abrual Vincennes Fair, to be field in the place named from October 8 to 13, inclusive.

The work of Reorganizing the Albany. Stove Company of Albany, N. Y., is making progress, and it is expected that the concern will soon be in shape to commence operations at their plant on upper Tivoli street. It is stated that James II. Carroll and John W. McNamara are the organizers and present owners of the plant.

HOLBROOK. MERRILL & STETSON have changed their quarters, dating from Sentember 1. and they are now to be found in the Home Life Insurance Company's Building, 256-257 Broadway. New York, where they will be glad to see their friends in the trade.

A CIRCULAR issued by the Fuller & Warren Company, Troy, N. Y., and braving the signature of Walter P. Werren, president, has, in accordance with the company's usual custom at this sessor, recently been distributed relating to business for the remainder of the year, and calling attention to various aubjects of interest. The atatement is made that the past six months has been an unusually busy time in their pattern department, and that they have placed upon the market many new goods, among the more prominent of which are several new ranges, a first-class parlor stove, and a full line of furnaces of great heating eapscity, with fire pots ranging from 18 to 35 irches in diam-The circular also calls attention to the fact that after September 10 the company will furnish repairs for stoves, furnaces and water heaters at the prices specified therein. In closing attention is called to the company's cipher code, for convenient use in ordering goods by

The Somenset Stove Foundry Company of Somerset, Mrss., are about issuing a new illustrated catalogue of their popular line of Somerset atoves and ranges, to which they have added a new feature. This consists of Goodfellow's improvements in grates, patented under the name Nonpareil. This is said to be a device to insure a fresh fire by removing the ashes on top

of the grate while the fire is burning and without interfering with it. The company have also secured the right to manufacture. Goodfellow's Improved non-pirati d and non-warping grate, also recently patented. With these new features added the company feel that there is nothing wanting to keep their salready popular go ds at the front. Business is reported quiet, but the company are running their works full especity.

The S Obermanner Company, Cincinnati, Ohio, report the dema, d for their productions, especially fine stove plate facings, as being excellent from all quarters, the month of July and August showing a larger volume of trade in their line than any similar period for some years past. The demand from small general foundries is also showing quite an improvement, and the company have received several orders from various blast furnaces, semething they have not had for 18 months past. Most of the orders received are for carlead lots.

HANSELL & Belson of 144 North Second street, Phuadelphia, have just published a 124-page catalogue descriptive of their line of goods. A large variety of cooking stoves and ranges are shown, including the Melrose, Hustler and Corker, all new five-hole ranges of neat design and moderate prices. A ful line of Liberty steel ranges is catalogued for the first time. Range boilers are made a special feature of the book. There is a good disp'ay of furnaces and heating stoves and large assortment of Globe and Laundry stoves. Hollow ware and kitchen goods are well represented, and gas, gasoline and oil stoves and their auxiliaries and refrigerators are assigned ample space to show the large line carried by the The catalogue concludes price-lists of repairs and miscellaneous goods, including two price-lists of mica, one giving the price per sheet, a list which will be much appreciated by dealers, no such list, it is elaimed, having been before published.

THE MICHIGAN STOVE COMPANY favor us with a sample of the large postera which they are now furnishing their agenta. These postera show itlustheir agenta. These posters show illustrations of six styles of Art Garland base burners. They are lithographed in colors on a cream tinted background while an illuminated border surrounds the whole. The poster is bound with metal borders at the top and bottom and is intended to be hung in a couapicuous place, to save the trouble of referring to the company's catalogue as well as to call attention to the beauty of this line of goods. The Michigan Stove Company are also furnishing triple signs, on which the dealer's name is read in front, "Garland Stoves and Ranges" at one side and "The World's Best" on the other side. An illustrated circular ta being distributed explaining the character of these signs. We have also received from the same company a beautifully printed circular calling attention to Syphon Oak Garlands, which are base heating oaks. They are made with the flue entirely encircling the base, the ashes falling through an opening in the center. The feed door opening in the center. The feed door is on the side and has a tilting device by which the direct damper is opened whenever the door opens, thus preventing smoke from issuing into the room. An independent circulating flue la provided for furnishing extra heat by reeeiving air from the room at the bottom of the stove and discharging it at the top. The fittings are all constructed to

insure tightness. These stoves are offered at only a trifling advance in price over direct draft stoves of the same estimated capacity.

GEORGE M. CLARK & Co., 149 to 161 Superior street, Chicago, handled a much larger business in the month i ist closed than in August, 1893. Their gas stove trade especially shows a large increase, having been stimulated to some extent by the gas war in certain The gas stove manufacturers will also reap considerable benefit from the gas war now ovening in Chicago, which is effecting a material reduction in rates charged by the rival companies. The firm's salesmen are all out actively working for orders. They have a new gas stove eatalogue in press, to be ready for distribution in a week or two. It will show a new line of gas heaters, called Jewel gas radiators, in addition to lines formerly made. Prices have been reduced from 50 cents to \$2 each on gas heaters. The firm's gas stoves will be exclusively used in the kitchen of the Pure Food Exhibition, which opens in Chicago October 1, to run two They will also make an exhibit in a booth covering a double space, showing various styles of stoves operated with manufactured and natural

WITH REGARD to the division of business interests in the Baxter Stove Company of Mansfield, Ohio, the following extracts from a recent letter will prove of interest: "The fact that coal and wood cook stoves are competing lines to vapor and gas stoves has militated, in our opinion, against the accomplishment of the best results, and on account of the further fact that a division of efforts in pushing two lines has a tendency to conflict with the best work, we thought it best to divide the business. We have two organizations, each working independently, and by concentrating the entire attention and efforts of each to its own special line better results will be secured. It has therefore been decided that the Baxter Stove Company will hereafter be manufacturers only of Baxter's Binner stoves, while the Monarch vapor and gas stoves will be manufactured and sold exclusively by the Monarch Gas & Vapor Stove Company. Toe former concern is composed of all the members heretofore identified with the company except Emmett C. Baxter, who retires from all ownership in the old company. In exchange for his in-terests he takes one-half the business of the Monarch lines, selling out his stock in the Baxter Stove Company to John L. Bixter, who will be the largest atoek holder and manager of the old company. In the Monarch branch Berry A. and Edwin D. Baxter will be associated with Emmett C. Baxter, retaining, however, an equal interest in the old company. The new company will continue to manufacture their goods in the factory of the Baxter Stove Company, and their office will be in the same building, but an absolute divorce has been agreed upon, and independent concerns will do business." The management is confi The management is confident that this step will redound to the advantage of Banner and Monarch stoves, and the manufacturers bespeak for the two lines the same kind and cordial treatment heretofo: e accorded them by the trade. Plans have already been matured for adding some very attractive new goods to the Banner line, and the friends of the company may also look for something interesting in Monarch something interesting stoves for 1895.

THE RINGEN STOVE COMPANY of St. Louis, Mo., have just issued from the

press an eight-page circular printed in blue-black ink, illustrative and descriptive of the Electric coal oil heater. The engravings show the general appearance of several varieties of the stove, a vertical section giving an idea of the internal arrangement, while other views represent the burner and oil reservoir. The vertical section on the first page of the circular illustrates the ventiduct tlues which extend from the base to the top of the stove and are so located that their entire surface is exposed to the direct heat of the burner. Air enters at the base of the stove, passes entirely around the oil reservoir, keeping its contents cool, and coming in contact with the heated flues, escapes at the top of the stove at a high temperature. By this plan a constant circulation of air is maintained which at the same time aids in the distribution of the heat, tending to produce a uniform temperature throughout the room.

#### Trade Notes.

THE PAGE ANNOUNCEMENT of the Bucket Pump Company. Cincinnati, Ohio, calls attention to seasonable goods. The illustrations show the appearance of the one-piece steel corrugated triple bottom Coal Hod which they manufacture, and the manner of constructing it is indicated also in the illustration.

The Illinois Roofing & Supply Company, agents, 203 Lake street, Chicago, are directing attention to Gilbertson's Old Method Roofing Tin, which they handle. They refer to this Plate and give prices.

THE TRADE will be interested in the announcement elsewhere of Benjamin C. Smith, 275 Pearl street, New York, in which attention is directed to heavy Water Back Couplings, illustrations of the goods being presented.

THE ANNOUNCEMENT O'E. S Wheeler & Co., New Haven, Conn., states that owing to the lower tariff the price on Gilbertson's Old Method Roofing Tin has been reduced \$2.50 per box of 20 x 28 for delivery after October 1.

THE PAGE ANNOUNCEMENT Of Richardson & Morgan Company, 92 Beekman street, New York, is devoted to the Cyclone Hot Air Furnace, a view of which is presented. The firm also allude to their Furnaces, Steam Boilers, Ranges, &c.

THE TWIN BURNER VAPOR STOVE COMPANY, St. Louis, in their advertise ment in another part of this issue call attention to their Twin Burner Combination Tinners' and Plumbers' Furnace. This Furnace has many features which make it valuable for either tinners' or plumbers' use. They are strong and substantially built, and as the company are closing them out, the price, we understand, will be found very reasonable.

ISAAC A. SHEPPARD & Co., Philadelphia, while extending the sale of their well known Paragon Furnaces, do not wish the trade to get into the way of thinking that Paragons are the only Furnaces they make Advantage is taken this week of a number of our forward pages to ahow a line of Furnaces from which it may be gathered that the makers are sole to satisfy the demands of anybody wanting a Furnace "as is a Furnace," at a reasonable price.

LALANCE & GROSJEAN MFG. COM-PANY, 19 Cliff street, New York, are having a great call for their improved

"L & G." garbage pail or cell bucket, which is found to be particularly adapted for use in flats, tenements and institutions. They have, among other similar establishments, recently fitted out all the cells in the Kings County Penitentiary, Brooklyn, with these articles. The advantages claimed for the pail are its strength, lightness and imperviousness; also, that being of wood, with agate or crystal steel enameled lining, the utensil is easily and effectively cleaned and kept a weet.

The Geauga Foundry & Mfg. Company, Painesville, Ohio, have long been known as manufacturers of Stoves but they have re-ently added a special department to their plant in which they will make a line of standard specialties under the trade-mark or brand of "Ohio" goods. Their initial list of such goods comprises the Ohio Water Tight Steel Mortar and Brick Hods, Ohio Steel Tack and Screw Boxes, Ohio Steel Tote Shop Boxes and Ohio Knock-down Stove Pipe. These goods are made under letters patent and are offered, it is stated, at very reasonable prices. The company have engaged C. M. Avery, who is well and favorably known to the trade, to act as their direct jobbing representative in this department of their works.

#### FLASHINGS.

RHODES, DICKELMAN & Co, Forest, Ohio, issue an illustrated circular for the fall trade which will be of interest to roofers and tinners generally. The first article noted is the patent slip joint reversible cave trough. The Mundwiler hanger is illustrated and described. Reference is also made to other eave troughs, end pieces, conductor pipe, elbows, ridging, &c.

APPLICATIONS have been received for instruction in the proposed class in sheet metal pattern cutting at the Pratt Institute Trade School, Brooklyn, N. Y., to the number of 14 or 15, showing that a real demand for this branch of trade education does exist among the younger members of the roofing and sheet metal trades in this vicinity. It is expected that the class in question will be started before the close of this month, so as to run concurrently with the other trade classes. In case any of our readers who may be desirous of availing themselves of this opportunity should not have noticed the previous references in The Metal Worker to this proposed class, they are referred for all information on the subject to Prof. C. R. R'chards, director of the department of science and technology, Pratt Institute, Brooklyn, N. Y. It is desirable that would be pupils should trans. mit their applicatio :s without delay, so that it may be known for how large a class it will be necessary to provide.

THE ST PAUL ROOFING, CORNICE & ORNAMENT COMPANY St Paul. Minn., send out advertising postal cards indicating the line of their work. On the back are small engravings of sheet metal fronts of different sorts, fron abutters, vanes, skylights, &c.

RHODES, DICKLEMAN & Co, Forest, Ohio, in a recent letter, state that they have been very busily engaged in getting their conductor plant in operation, which was completed a few days since, and are now producing conductor pipe recond to none in point of quality and amount. They add that their reversible cave trough has proven itself a success in the highest degree judging from the way orders are coming in, this latter article being now handled by jobbers and dealers in over 22 States.

# TRADE REPORT.

#### The Iron Market.

The effect of the general resumption of work among the Coke furnaces of the Central West is clearly shown in the statistics for September 1. On that date the capacity active was 125,879 tons per week, against 94,707 tons on August 1. For the whole country the weekly preduction rose from 115,356 tons on August 1 to 151,113 tors on September 1, the highest reached since July 1, 1893.

The grave question is whether the trade can stand this rate of production without a serious effect upon prices. It is true that in August stocks were s'ill declining, but it must be remembered that the majority of furnaces did not blow in until the end of August.

The leading producer of Pig Iron in the South reports some good sales, two weeks aggregating over 40,000 tons. Among these is a block of 12,000 tons to a local Pipe foundry, 4000 tons to a Louisville Pipe foundry, and 10,000 tons to a Cincinnati firm of merchants, with option to double the quantity. All these sales, we are told, were made at current prices.

The market for Charcoal Iron has been in a terrible condition lately. In Chicago bankrupt stock is being forced on the market, and \$13 has become an open quotation in that market.

Pig Iron.—The New York market continues very quiet, some sales agents reporting inquiries small and far between. We quote standard brands \$12 50 @ \$13 for No. 1; \$11 @ \$12 for No. 2, at tldewater. Southern Iron, same delivery, \$11.50 @ \$12 for No. 1; \$11 @ \$11.25 for No. 2; \$10.35 @ \$10.50 for No. 3; \$10.75 @ \$11 for No. 2 Soft, and \$11 @ \$11.25 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9.75 @ \$10.25. The freight from Birmingham is \$3.50.

Sellers report a very good demand for all grades of Pig fron in the Philadelphia district, and in most cases deliveries are called for almost as rapidly as the furnaces can make them. There is an intimation of an advance in freights from the South to take effect on the first of the month, and this may have some influence on the market, but for the present consumers are perfectly easy, feeling sure of being able to get all the Iron they want at rates now current. General quotations for Philadelphia and equivalent points are about as follows:

Standard No. 1 Foundry X . Standard No. 2 Foundry X	\$12.50 @ 11.50 @	\$13.00 12.00
No. 2 Plain.		11.(n)
No. 1 Soft		11,75
No. 2 Soft	10.75 Œ	11.00

The outlook in the Chicago market is reported as still very encouraging from the standpoint of local producers. They have enjoyed another week of good business, with an excellent demand from general consumers. Few orders for round lots were entered, but negotiations are pending for considerable quantities. One company are now so well sold up as to talk confidently of advancing prices. The inquiry for Southern Iron is a little better, but sales

are light. Holders of bankrupt stocks of Lake Superior Charcoal Iron are more persistently forcing them upon the market, and are therefore offering them at very low prices. Makers' quotations on guaranteed brands and grades are firmly held. Quotations are given as follows for cash'

Lake Superior Charcoal	\$13.00 @	\$15.00
Local Coke Foundry, No. 1	10.25 @	10,50
tocal Coke Foundry, No. 2	10.00 @	10,25
Local Coke Foundry, No. 3	9.50 🚳	10.00
Local Scotch	10.25 %	10.50
Ohio Strong Softeners No. 1	13.00 @	13.50
Southern Silvery, No. 1	(6	
Southern Silvery, No. 2	@	
Southern Coke, No. 2	10.75 @	11.25
Southern Coke, No. 3	10.50 @	-10.75
Southern, No. 1. Soft	10.75 @	11.25
Southern. No. 2, Soft	10.50 @	10.75
Alabama Car Wheel	17.50 @	15.00
Jackson County Silvery	15.50 65	16,00
Other Ohio Silvery	14.25 @	14.50

In Pittsburgh and its vicinity the market for Bessemer Pig has shown a further decline during the week, and the expectation prevails that prices will still further decline, as purchases are made only on close delivery. Foundry Iron continues quiet in demand, but prices are being sustained. Quotations are given as follows:

Cincinnati advices indicate that there has been more increase in the sales of Southern Pig Iron during the week, but the offerings were ample while not excessive, and prices are without quotable change. The Iron Pipe works were the chief buyera in this and the Southern district. There is some inquiry from Agricultural works, but they have not bought largely as yet, and the jobbing foundries have not increased their purchases to any large extent. There have been several sales of 500-ton lots, and some of 1000 tons, running through this year and three months into next year, amounting in the aggregate to upward of 10.000 tons, but prices are the same for all deliveries. There is not much demand for Charcoal Iron, but there continue to be small sales. There is scarcely any buying by Stove works. Some moderate quantities have been taken for Eastern shipment, mainly of No. 2 Foundry. Quotations are as follows:

There is no change to note in the Pig Iron situation in St. Louis. The volume of business during the week has been fair and prices ruling are unchanged. There are no large purchases and there does not seem to be any disposition on the part of consumers to anticipate their wants and provide for the future. Consumption is gradually increasing and as there are no large accumulations of Iron on the furnace banks, it is possible that prices may improve. The present situation, however, does not warrant the state-

ment that any improvement in this direction is likely to occur. We quote as follows for each, f.o.b. St. Louis:

 Southern Coke, No. 1 Fourdary
 \$11.00 \$11.25

 Southern Coke, No. 2 Foundry
 10.25 \$10.50

 Southern Coke, No. 3 Foundry
 9.75 \$10.00

 Southern Car Wheel
 16.50 \$17.00

#### Metal Market.

Pig Tin.— The market has been almost wholly under apeculative control and the dealings have reached a considerable total. Several hundred tons were sold to consumers early in the week, but the demand from this quarter has fallen off within the last few days. Wholesale prices have touched higher figures for spot stock, but deliveries for later months have gone at 0.25¢ below the highest point. Along with the fact that at least 20,000 tons of Tin are in sight, this discount on futures is at least suggestive. Prices for small lots remain at last week's level—namely, 17¢ @ 17½¢ ? Ib for Straits Pig.

Copper.—It is the general opinion that contracts closed during the past month or six weeks cover the requirements of most consumers for the balance of the year. The heavy shipments thus far indicate that the European marketa also have enough American Copper to meet their wants, and the last statistics warrant the inference that Europe has quite enough of other Copper as well. The proposed agreement to restrict production on both sides of the Atlantic has not been effected, and as far as the relation of supply and demand is concerned, the market does not appear to be in better position than it was when large sales of Lake Superior Ingot were made at 9¢ 7 lb. Still that price is bid by some operators, and 91¢ @ 91¢ named as the lowest at which wholesale purchases can be made. .n the retail trade the conditions are similar to those of last week. Although the demand from the smaller consumers is better than it was a few weeks back, orders and inquiries do not come up to expectations. Jobbers' prices are unchanged for both Inget and Sheet Copper. Manufactured Copper is, however, firmer, and there is talk of a posaibility of higher prices in the near

Pig Lead.—Under the influence of rather keen competition to sell among home producers and lively foreign offering the market has gradually weakened. In fact, it has approached a stage very close to demoralization. Foreign product has been put in at as low as 3.20¢ @ 3.22½¢ ex.vcssel. To meet this sellers of domestic Lead dropped their figures a trifle lower and subsequently assumed the aggressive position, letting prompt shipments go at 3.15¢ and soliciting bids of 3 10¢ for October and later delivery in a manner suggesting that the negotiation was strictly with a view to business. Purchases of about, 1000 to

1200 tons of foreign Lead have been closed since the new duty went into effect. Some was purchased by dealers, but the greater portion went to the combination of largest consumers. About sales of domestic Lead there has been more than usual reticence, but that a liberal business has been effected is morally certain. Probably some 3000 tons have changed hands, chiefly for future delivery. A fair buying movement is noted by jobbers, the price asked for small lots of American Pig being about 34 file.

Lead Pipe and Sheet.—The demand for Manufactured Lead is still below the average, although some of the smaller plumbers' supply houses appear to be receiving more orders than for some weeks past. Prices in this district are well maintained in accordance with the list quoted elsewhere.

Spelter —Business here has been only fair, and inquiries are of a very commonplace nature. From other quarters than the New York market, however, enough orders have been placed to tone up the Western market. Prices are firm for wholesale lots. Smaller quantities are quoted by jobbing houses at the same rates that have prevailed for some time past—namely, about 4½ for Ordinary Western, with the usual premium on fancy brands.

Antimony.—A moderate business only is passing, and prices do not vary much from  $10\frac{1}{4}\phi$  for Cookson's and  $9\frac{1}{2}\phi$  for Hallett's in small lots.

Nickel.—Prices remain on the basis of about  $40\phi$  for ordinary lots, early or prompt delivery.

Tin Plate.—The market bas been a disappointing one during the past week. Some few large consumers, who virtually buy direct, have, it is understood, placed fairly liberal orders for October and later deliveries, but can makera manifest indifferent interest, as do canners, while jobbers act as though afraid of the extremely low prices. They can purchase full weight Besse mer Steel Coke finish Plates at or very close to \$4, and 100 lb at \$3 80 or better. Siemens Steel are relatively as low, or on the basis of \$3.90 for 100 lb Dean grade Ternea may be had at \$3.921 @ \$3.95 for 14 x 20 and \$7.87 $\frac{1}{2}$  for 20 x 28, full weight, with discount on 20 x 28, full weight, with discount on 100 ib or lighter weight. Other Ternes are relatively as low. Charcoals are about \$4.65 for IC, Melyn grade, one-half Cross Allawaya at \$4.15 for do., full weight, and \$4 @ \$4.05 for 100 ib. Corresponding prices are made on other descriptions. Soot business on other descriptions. Spot business has been of a purely hand to mouth character, but a fair amount of small orders are passing, particularly in the department of domestic Roofing Plates. For small lots of Plates out of store prices grade, 1C, \$6; do., Melyn grade, Crosses, \$7.75; do., Allaway grade, IC, \$5 30; do., Allaway grade, IC, \$5 30; do., Allaway grade, IC, \$5 30; do., Allaway grade, IC, \$5.45; do., Grange grade, Crosses, \$6.40; do., Grange grade, IC, \$5.45; do., Grange grade, Crosses, \$6.45; do., Terne, M. F., 14 x 20, \$7.20; M. F. 20 x 28, \$14.40; Worcester, 14 x 20, \$5 70; do., 20 x 28, \$11; Alyn grade, 14 x 20, \$5.05; do., 20 x 28, \$10 @ \$10.25; D. R. D. grade, 14 x 20, \$4.85; do., 20 x 2°, \$9.70. IC Coke: Penlan grade, \$5; do., J. B. grade, 14 x 20, \$4.80; do., 95 lb, \$4.65; do., 90 lb, \$4.55. IC Bessemer Steel, Coke finish, 14 x 20, full weight, \$5.10; do., 100 lb. \$4.77\frac{1}{2}; do., 95 lb, \$4.62\frac{1}{2}; do., 90 lb, \$4.55. IC Bessemer Steel, Coke finish, 24.7 are about as follows: Charcoal, Melyn

\$5.30. IC Siemens Steel, Coke finish, sq., \$5.35. Wastera: S. T. P. grade, 14 x 20, \$4.60; do., S. T. P. grade, 20 x 28, \$4.80; do., Abercarne grade, 14 x 20, \$9; do. Abercarne grade, 20 x 28, scarce.

A special London cable diapatch to The Iron Age of September 13 reports on the British Tin Plate market as follows:

Tin Plate market looks better. The demand is steadily improving, and there is more inquiry for both prompt and forward shipments. Makers are more inclined to book orders at current rates. Sales have been made of fair lines of oil sizes. Swansca quotations at present are about as follows:

Bessemer Cokes, IC	10/6 @	
Siemens Cokes, IC	10/9 0	
J. B. Steel Cokes, IC. Dean Ternes, 20 x 28	10/9 @ -	
Charcoais, IC.	11/6 6	12.6

Sheet Iron.—The demand for Black Iron in this section shows little improvement, while prices are practically unchanged. Galvanized Sheets are more active and mills are generally behind hand with orders. Jobbers generally report a better inquiry in this line. Some large inquiries for Black Plates for tinning have been received from this side by the Welsh mills.

#### Chicago Report.

Scrap.—A much better movement is foreshadowed by increased inquiries for all kinds of Old Material. Dealers quote the following list of buying prices, Chicago delivery:

•		
Per	net ton.	Per fb
No. 1 Wrought Scrap	\$7.00

#### CONDITION OF THE

### Hardware Trade.

USINESS is improving. Manu-DUSINESS is improving. Manufacturers and jobbers agree in referring to an increasing demand, better feeling and excellent prospects for continued improvement. This naturally is more marked in some lines than in others, and some manufactures and some manulines than in others, and some manufacturers speak in stronger terms than others of the increase in their business. There are, however, few lines in which an improved condition is not perceptible. There are indications also that the demand is setting in more freely in the South and Southwest than in the East and Northwest, but it is expected that things will soon take a favorable turn in these sections, and that before long there will be a general revival of business. While trade has assumed a larger volume than for some time orders are generally of moderate size, the trade evidently purchasing conservatively and without anything of a speculative feeling. It is noted also that the largest jobbing houses are still limiting their purchases for the most part to their early require-ments. In regard to many lines also there is a feeling on the part of some large buyers that while existing prices are not likely to be much further shaded, there is a good prospect of their continuing on about the present basis, so that not much risk is incurred of having to pay more for the goods in the near future, and they prefer to take the chance rather than order beyond their present requirements. There are others who take a somewhat more sanguine view of the situation and re-fer to the possibility of a shortage in some lines when an active demand sets in. In support of this view the undoubted fact that stocks in the hands of the trade are exceptionally light is referred to.

Advices from Chicago.—The volume of business in Shelf Hardware appears to be about the same as was reported last week. The improved condition of trade has led to the employment of additional salesmen by some houses who now see an opportunity to regain part of their trade, which was relinquished during the extreme depression. House Furnishing Goods are more active. The demand for staple goods is improving, but the country trade is still slow to speculate on the future. While orders are larger than they have been there is an absence of orders for carload lots. The ravages of forest fires in the Northwest are expected to result in a considerable volume of business to jobbers located nearest to the afflicted territory. The enterprising inhabitants of the devastated towns are rebuilding as rapidly as possible. The Heavy Hardware trade continues to improve and the volume of business in Iron and Steel considerably exceeds that for August. Prices are so low that a large addition must be made to the tonnage handled in order to compare favorably with past years, but profits are better in proportion to the amount of capital needed to conduct business. Collections are reported fair by some merchants and very good by others.

#### Notes on Prices.

Wire Nails.—The improvement to which we have referred during the past few weeks continues, and the mills which are in operation are doing a good business, their orders being mainly for lots of moderate size, the aggregate of which is, however, large. The largest buyers are not placing orders in excess of their early requirements, preferring

to take their chances as to the future course of the market. Prices are firmly maintained by the manufacturers on the basis of \$1 to \$1.05 for carload lots at mill. The New York price is \$1.20 on dock and \$1.25 to \$1.30 from store.

Advices from Chicago. - The situation remains about as stated last week. Manufacturers are doing a much better business in other sections than in this immediate vicinity. Large buyers here are holding off until they see that prices are absolutely rock rooted. Quotations continue at \$1.10 to \$1.15, Chicago, on factory lots. Jobbers report a considerably better movement, but thus far it has been almost entirely confined to small lots shipped from stock, on which they quote \$1.15 to \$1.20.

Cut Nails.—There is little change in the situation. The demand continues fair, and the price in the Eastern market is still represented by the quotation of 90 to 95 cents for carload lots on dock. The store price in New York in small lots is \$1.05 to \$1.10.

Advices from Chicago. - A decided improvement is experienced by manufacturers, who have been receiving a much larger number of orders recently. Buyers, however, are not disposed to enter contracts of any size for future delivery, preferring to order in small quantities and more frequently rather than to carry large stocks. Prices are unchanged at 95 cents, Chicago, for factory lots, on 60-cent average. bers quote small lots from stock at \$1.10

Barb Wire.—While the volume of business is not heavy the market is characterized by an excellent tone and the manufacturers are maintaining prices steadily. The market is still represented by the following quotations for Four-Point Galvanized, delivered at the points named: Pittsburgh, \$2 to \$2.05; Cleveland, \$2.05 to \$2.10; Cincinnati, Allentown, Chicago, or New York, \$2.20 to \$2.25.

Advices from Chicago. - The demand is somewhat of a disappointment. The slight movement noted two or three weeks since has not resulted in much of a growth. It is now believed that not much heavy business will be entered until after October 1. Prices for large lota do not seem to be affected, but small lots of Galvanized are now being shipped direct from the milla in this locality at \$2.25, while orders filled from jobbers' stocks bring \$2.35.

Cordage.-There has been but little change in the Cordage market during the past few weeks, prices remaining at substantially the same figures as for some time. The market is still in the hands of the jobbers, who are under-selling the manufacturers \(\frac{1}{2}\) to \(\frac{1}{2}\) cent a The demand is fair but not pound. heavv.

French Rat and Monse Traps.— Burditt & Williams, Boaton, announce reduced prices on the Marty French Traps for rats and mice, for which they are sole agenta in the United States. This reduction is made in view of the lower duties under the new tariff. The revised prices are as follows:

No.	F	er	dozen.
1, Rat Trap			\$15.00
3,	٠.	• • •	4.75
4, Mouse Trap		٠.	3.15
5,			

Standard Fiher Ware.-The Standard Fiber Ware Company, Mankato, Minn., have recently issued a revised price-list on their line of Standard

Fiber Ware goods. Many of the articles are unchanged, but reductions are made in a few, including Water Pails.

Glass .- The Glass scale for the ensuing fire has been settled upon the basis of a reduction in wages of 221 It is reported that since September 1 280 pots, or their equivalent, have been put in operation. The demand for Glass is fair, but does not show any increase over that of the previous two or three weeks. Business in Plate Glass continues good, the factories that are in operation turning out the usual amount of Glass. American Window Glass is quoted at 85 and 5 per cent. discount for single and 85 and 10 per cent. for double strength Glass Imported Window Glass still remains at 80 and 10 per cent. discount.

Old Metals .- The demand for Old Metals continues moderate with little change in prices. The following quotations represent about the rates now paid by New York dealers:

Heavy Copper
Light and Tinned Copper # 15 6
Heavy Brass D 4146
Light Brass \$2 15 384\$
Lead
Tea Lead % 1b 21/2#

THE TRADE will take interest in the auction notice in this week's issue of E. Bissell. Son & Co., 12 Murray street, New York, which will take place next Tuesday, the goods comprising Hard-ware, Edge Tools and Tinned Ware On the day following, Wednesday, September 19, by order of the Lalance & Grosjean Mfg. Company, there will be a large special and unreaerved sale of Crystal Steel Enameled Ware and Blue and White Ware. This will be, as the announcement reads, the first sale ever made of Crystal Steel Enameled Ware

and will therefore be worth the attention of the trade. Further particulars will be found in the announcement.

#### Profitable Reading.

Of how many mechanics can it be said that their reading is truly profitable? Of course it is an accepted fact that large numbers exercise such discretion in the choice of that which they read that all must acknowledge them to be better informed for the time thus spent. But nevertheless there is a much larger class to whom the thought of choice in the matter of reading or the deliberate laying aside of poor for good literature does not come. The daily papers, perhaps, interest them first. But for what? For real and valuable information, or for the extended reports of prize fights and crimes, gossip and sporting news? The average daily paper of to-day is far from the perfect news vender it should be, but notwithstanding, even the poorest contains much of value to the reader if he will but seek it, while the editorials of some of the best are masterpieces in their way and present clearly, even if not impartially, extended criticism upon the most important events of the times. Such reading is profitable. It builds up the man, gives him thoughts above himself and raises him from his every day life to that of great men and thoughtful writers.

#### Trade Papers and Books.

The mechanic who does not take a paper devoted to the interests of his own trade and read it thoughfully falls far short of profiting by all his opportunities. Such a paper puts him in touch with other men of like tastes, gives him a chance to compare their methods with his; in fact, makes him more independent of his immediate surroundings and fits him for a larger sphere of usefulness. It is thus that some bright young mechanics climb so rapidly above their fellow men perhaps of twice or thrice the direct experience and assume greater responsibilities. Beyond the time spent in read-

ing the daily and the trade papers. every mechanic may, if he will, still find a few moments each day to devote to either interesting or instructive literature. A boy who was brought up on dime novels cannot in a day learn to enjoy Scott or Dickens, but there is nevertheless an ample store of good fiction, intensely interesting, and, in many instances, decidedly instructive. History is told in such pleasing manner by many of our able writers that one bardly appreciates what he is reading, while the simplicity of some of our greatest scientists has enabled them to lay before us in intelligible language a large store of the most valuable scientific knowledge. The practical universality of the modern free public library removes all excuse for not reading because of nothing to read. and to-day, merely for the asking, the mechanic may freely enjoy such books as his father never thought of reading, because he could not afford to purchase

#### Lectures on Sanitary Plumbing.

Among the evening educational classes conducted in the Young Men's Institute, 222 Bowery, New York City, to which reference is made in another column, is a class in sanitary plumbing-a new and interesting feature of the good work of the institute which deserves to be more widely known. In this class the theory of sanitary plumbing is carefully taught, by means of lectures by Prof. James Tennant, as well as the principles of natural philosophy bearing thereon. The latest improvements in fixtures, traps, boilers, pipings and testing of soil pipes are thoroughly explained, the lectures being illustrated by charts, drawings and lantern views. The class is open to any young man between 17 and 35 years of age, giving satisfactory references as to character, who will join the institute and pay the class fee, amounting to 50 cents a month. At the end of each term examinations are held and certificates of progress are awarded. Diplomas of graduation are given at the end of the year to those who have satisfactorily completed their studies, while valuable prizes are bestowed on those who show the greatest proficiency. The school year commences in October and ends in May, giving an eight months' course, the sessions being held twice a week, on Wednesdays and Fridays, from 7.30 to 9.30 p.m. The value of this character of theoretical instruction to young plumbers who are already gaining a knowledge of the practical side of their craft in the course of their daily work is obvious. For the small sum of \$4 a fund of information can be obtained by an earnest pupil which

will be invaluable to him in his trade. Moreover, he can also attend the drawing classes, or take up any of the other subjects treated, such as electricity, arithmetic, bookkeeping, &c., for a small additional payment.

#### A Perplexing Problem.

One of the vital questions affecting the comfort and physical wellbeing of dwellers in great cities, and one that is only second in importance to the provision of an adequate and wholesome water supply and an effective sewerage system, is that of the disposal of city garbage. Rapidly swelling, as are the populations of the leading cities of the United States, the need of an economical, effective and sanitary method of either destroying or utilizing the masses of refuse which accumulate in them becomes daily more urgent. In no city is the solution of this problem' more emphatically needed than in New York, A committee of the city authorities has been investigating the subject for some months, but apparently without success in reaching any satisfactory conclusion. Hitherto New York City has followed the deplorable practice of dumping her garbage into the sea, a proceeding which, in addition to the danger of obstructing the navigable channels in the harbor, is particularly offensive, in that a large part of the more or less buoyant refuse is carried by the tide onto the surrounding beaches, where a considerable proportion of the city's dwellers resort for health and recreation in the warm months of the year. The urgent need of a better system of garbage disposal is admitted by every one, but the question of how to effect the improvement is not easy of decision. Cremation is the best plan hitherto adopted both in this country and in Europe, but, for an immense city like New York, the crematory systems as at present used in other places have many disadvantages. They are expensive, slow and inadequate, and they fail to provide for the disposition of a large proportion of the garbage of the city which is not readily destructible by fire. A fortune awaits the inventor who can solve this perplexing problem satisfactorily on original lines.

Goesip in the metal trade has it that Strausa, the great Tin king, is actively opposing the clique which is trying to corner Tin. The arch manipulator now is one Rickard, who is backed by an influential firm. It is variously estimated that the clique have already accumulated from 7000 to 13,000 tons of Tin. Little confidence is expressed in the success of the movement. It is stated that this country is singled out for the dubious distinction of having the metal unloaded on it. It is easy to buy and run up the price, but the selling at a profit is quite another matter.

# THE LETTER BOX.

#### Coal and Steam.

From G. W. W., Provincetown, Mass.—Please inform me through The Metal Worker how much steam 1 pound of water will make, and how much coal it will take to turn the water into steam?

Answer .- We presume our correspondent wants to know how many cubic feet a pound of water will make, but in that case he should have stated under what pressure it is to be measured. At atmospheric pressure 1 pound of water evaporated into steam will fill 26.36 cubic feet; at 50 pounds pressure the same weight of steam will fiil 8 38 cubic feet, while at 100 pounds pressure a pound of steam fills 4.33 cubic feet. The amount of coal necessary to turn the water into steam will depend upon the quality of the coal and the kind of boiler. Theoretically, the best anthracite coal will evaporate 15 pounds of water; practically 10 pounds is a very good result. Of course, it is understood when evaporation is spoken of that the steam is made at the atmospheric pressure. To produce 50 or 100 pounds pressure, as the case might be, would require more coal to the pound of steam.

#### Galvanizing Dross.

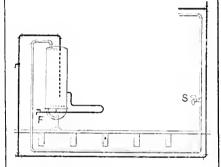

From M. M. Company, London, Ont.—We were interested in an article published in The Metal Worker of September 8, in regard to galvanizing dross. We should be glad if you would kindly advise us what degree of heat is necessary to treat the dross to secure the result stated—that is, the separation of the zinc from the impurities. Could this be accomplished in an ordinary iron potash kettle? When the dross is melted what would be the best method of separating the material? Would it be better to dip out the top product, or take the dross from the bottom, the same as in the original drossing of the galvanizing kettle? This latter treatment would, we presume, after removing the dross, leave the residue as more or less pure zinc.

Answer. -The degree of heat required in separating zinc from dross should be sufficient to allow the zinc to rise to the surface of the mass. When removing the dress from the galvanizing kettle by means of the perforated iron skimmer, care should be taken to allow much of the free zinc to drain off, which can be done by shaking the dross in the skimmer over the melted zinc. An ordinary iron potash kettle, if of sufficient size and thickness, will answer for melting the metal. After the dross has been melted it should be allowed to stand for some time, being kept in a melted state, thus allowing the heavy part to settle to the bottom. If there is danger that the

dross will be taken out with the zinc, the skimmer can be placed on top of the metal, thus pressing down the dross and allowing the melted zinc to flow through the openings in the skimmer, when it can be dipped out by means of a ladle. After removing all free zinc possible by the above method, the dross can be taken out by means of the perforated iron skimmer, thus giving any zinc that may remain an opportunity to drain off.

#### Faulty Boiler Connections.

From OLIVER TWIST.—The system of piping shown in Fig. 1 has a number of faults which might have been

Faulty Boiler Connections.—Fig. 1.— Showing Usual Method of Piping.

avoided. A man was sent to repair a part of this apparatus the other day, and, of course, the first thing he had to do was to empty the boiler. It is evident that the plumber who put the faucet at the bottom of the boiler, as shown in the sketch, intended it to be used for that purpose. After opening

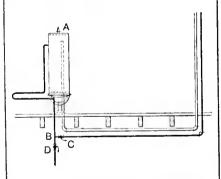

Fig. 2.—Showing Boiler Upside Down.

the faucets in the bathroom and at the sink, as there was no vacuum valve to admit air, the water refused to run out, and an examination showed the trap in the basement which caused the trouble. As there was no way of draining the pipes in the basement they remained full as far up as the faucet at the kitchen sink, preventing the entrance of air to the boller. There were no unions at the top of the boiler which could be loosened to accomplish the

same purpose. The pipes between the water back and the boiler happened to be of iron, so the plumber took the easiest way out of the difficulty by loosening a union on the upper pipe, and opening the faucet at F the boiler was thus emptied. The idea of omitting the vacuum valve, and not connecting the boiler with a sediment cock and blow off, as it should be, was to avoid expense. This is not true economy, however, as it occasions much extra work in the future, to the sorrow of the owner. If people must have the pipes run under the basement floor rather than under the kitchen ceiling, the following plan could be adopted:
The ordinary range boiler in this country by head and the state of the s try has two holes in the top, one in the side and one in the bottom, as in Fig. 1. Turn the boiler upside down, as in Fig. 2, and place a vacuum valve at A, and run a small pipe from it to the kitchen sink; run the upper pipe from the water back into the side of the boiler, which will now be near the top. The hot water supply for the bathroom is run up within the boiler, as shown, and the cold water is connected to the bottom, with a tee leading to the water back. By leaving a tee at B in the basement this pipe may be used as a blow off by closing the cock C and opening the cock D to sink in the basement. If there is no sink in the basement it may be safely run into the cesspool in the basement floor. This is the writer's own method, and he has never seen it elsewhere. It has these advantages-it takes less pipe, the water circulates better and the job presents a better appearance.

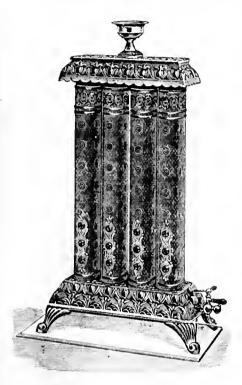

#### Wants One for His Tinshop.

From Bachelon, New Jersey.—Having read the letter of "Father" in The Metal Worker of September 8, I am greatly interested, for I am on the bachelor list and a tinsmith of 20 years' standing. I started out when I was about 16 years old and have been through the mill, as the saying goes. I have been thinking it would indeed be a joy to have a wife like one of "Father's" daughters. I wonder if they are all married or keeping company. I would like to hear from "Father" in regard to his daughters. His letter is very entertaining.

Note.-We have preserved the full address of this correspondent, and if "Father" finds this letter as entertaining as his has been we will endeavor to inspire this bashful bachelor with courage to meet him, though match making is not one of the functions of The Metal Worker. It is an old saying that it is better late than never, and sympathy will be felt for "Bachelor," who at last has seen the error of his way. He makes some confession as to age and experience that may or may not be of advantage in the eyes of the daughters and tend to influence his future either for bliss or for benighted bachelorhood.

#### Fire King Gas Radiators.

A. Weiskittel & Son of Baltimore, Md., have just added to their already extensive assortment of gas burning appliances some new designs of radiators, illustrations of two styles of which are shown in the accompanying engravings. In connection with these goods particular attention is called to the fact that all cast iron parts are heavily brass plated, and that each column or tube is set with three cut jewels of different colors. The cocks are supplied with

Fire King Gas Radiators.—Fig. 1.— Radiator with Embossed Russia Iron Flues.

pilot light and a damper, so that all burners light simultaneously. Upon the top of each radiator is an urn containing a bowl for holding water. Another feature in connection with the radiators is the embossed Russia iron tubes, which add to the attractiveness of the The radiators are made in four design. sizes, having four and six columns or tubes in single row and four and six columns in double row. All sizes are made with and without the open work casing shown in the cuts. The manufacturers refer to an incased gas radiator as something entirely new and original, and that this style of treatment adds much to the finish of the goods, making them closely resemble steam or hot water radiators which are used in the finest apartments. We understand that the salesmen of Messrs. Weiskittel & Son are now out on the road taking orders, each traveler being supplied with an aluminum sample of the radi-

We have received the new catalogue of the Pratt Institute, Brooklyn, N. Y., for the season 1894-95. The growth of the work in this important educational institution is illustrated by the enlargement of the present catalogue to 122 pages. The trade school matter exhibits no important change. The various trade classes will commence their six months course on Monday, September 24, and we are informed that the applications for instruction in

plumbing, painting and carpentry are more numerous than ever before. Sixty-eight applications for the plumbing class alone have already been received, and more will certainly come in before the opening of the session. The class room has, however, accommodation for only about 50 students.

#### A Telescoped Cupota.

An accident that happens not very often to foundrymen occurred recently at the works of the Radford Pipe & Foundry Company at Radford, Va .namely, the telescoping of one of their large cupolas. Perhaps owing to faulty construction, this cupola spread at the charging door section, allowing the stack to drop something like 5 feet. The problem then was, how to restore the cupola to its original position without accident and without removing the lining and taking the capola down section by section. This was expeditiously accomplished by first lashing the cupola at the top to the main building of the plpe foundry; then large cast iron shoes were bolted to the shell just above the roof of the cupols house, and these in turn were bolted to long timbers 12 x 12, which were securely blocked and wedged into position as the cupola was straightened back into place by the use of chains and turnbuckles. As soon as in position the under sections were taken away, leaving the stack in mid-air securely lashed to the building and supported by timbers and castings just described. The roof of the cupols

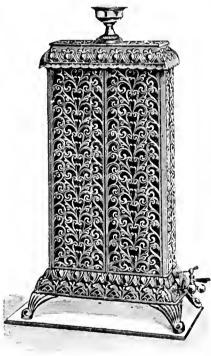

Fig. 2.—Radiator with Open Work Casing.

house was strengthened in the mean time by heavy timbers running from the ground to the cupola loft and thence underneath the roof. As the lower part of the old cupola was somewhat worn, and a new one of larger size desired, a new 96-inch Whiting cupola was erected in place of the old, and joined to the stack which had been held in place. The employees having the job in charge were very much pleased and gratified at the successful completion of the rather delicate work they had undertaken.

Young Men's Institute, New York.

There will be special exercises at the Young Men's Institute, 222 Bowery, New York City, on Tuesday, October 2, to formally open the educational department of the work. The exercises will consist of music and short addresses in the large hall of the institute, and all the class rooms will be open for the inspection of the visitors.

An excellent educational work is being done by the institute each year. Instruction is given in the following subjects: Steam engineering, practical subjects: Steam engineering, practical electricity, sanitary plumbing, carriage drafting, mechanical drawing, architectural drawing, freehand drawing, arithmetic, bookkeeping, penmanship, shorthand, typewriting, Euglish grammar and composition, vocal music and glee club, and first aid to the injured. The classes are open to all young men between the ages of 17 and 35 years. A distinctive feature of the educational work is that the theory is taught to those who are getting the practical part of the subject in their daily work. Firemen are taught all the theory necessary for becoming engineers; engineers are prepared to take charge of higher grade engines; machinists are taught the mechanical drawing which they need in their work; young men in offices are taught the commercial subjects. In this way the efliciency and commercial value of each student is increased to his present employer.

The enrollment for the season of 1893-94 was 425 young men. The quality of work done has shown a decided improvement each year. The school year continues until May, when diplomas and prizes are awarded by the Committee of Management. Admission is free to the opening exercises on October 2, and all persons interested are invited to attend.

The next meeting of the Western Foundrymen's Association, will, upon the invitation of Pickands, Brown & Co. on behalf of the Illinois Steel Company, be held on Wednesday, September 26, in the afternoon, at the South Chicago works of the Illinois Steel Company. The members and their guests will take the 2 p.m. train on the Illinois Central from the Randolph street station, and in order that all may be provided with tickets, it is especially requested that those who go upon this expedition meet in the men's waiting room of the station at 1.30 p.m. The afternoon will be spent in inspecting the blast furnaces and mills of the Illinois

Steel Company, and the members will return from South Chicago in time to attend a dinner which will be held at the Palmer House at 7 p. m. After dinner a short business meeting will be held, at which E. C. Potter will read a very Interesting paper on "The Biast Furnace." There will be no expense attending the trip to South Chicago, as Pickanda, Brown & Co. have very kindly offered to provide transportation for the members of the association and their guests. The expense of the dinner, however, will be met by the payment of \$1.50 by each one that attends. All foundrymen, whether members of the association or not, are cordially invited to go on this trip to South Chicago, and to the dinner afterward. It is absolutely necessary, however, that those who intend being present, either on the trip or at the dinner, should so notly the secretary by September 22, in order that tickets and

accommodations may be provided.

# ROOFING AND CORNICE.

#### Pediment Chart.

BY W. N.

I send herewith for the benefit of the cornice maker the accompanying diagrams and descriptions, showing my method of laying ont pediments of any size, without going to the trouble of drawing full size details. They also show my method of laying out pediments of different lengths, having the same rake and profile, using but one pattern, as indicated in Fig. 2, and the pediment chart shown in Fig. 3. Re-

feet 1½ inches; deduct the 2 feet 1½ inches from the 7 feet before obtained, and there remains 4 feet 10½ inches, which is the distance between the brackets for the two ends of the cornice, as shown. For the two center spaces, and the one half of the second pier, which is 1 foot 6 inches, the width of the window opening, which is 3 feet, and one-half of the center pier, which is 1 foot 6 inches, the total of which amounts to 6 feet. Now add one half of the second bracket, which is 4½ inches, the one-half of the center bracket, which is 4½ inches, and

Pediment Chart.-Fig. 1.-Front Elevation of Cornice.

ferring to the diagrams, let Fig. 1 represent a front elevation of a cornice drawn to a scale of \(\frac{1}{2}\) inch to the foot, the hight of the cornice being 4 feet, and including the pediment 6 feet 8 inches. There is also shown in Fig. 1 the measurements of the brick piers and window openings, besides the brackets spaced to set over the brick piers, the correct lengths of the pediment and crown moldings returns being given. In this connection it may not be out of place to show how the divisions between the brackets and the lengths of the pediment and crown moldings are determined.

As shown in Fig. 1, the width of the window openings is 3 feet, the end piers 2 feet 6 inches and the middle piers 3 feet, thus making the total width of the building 26 feet. The width of each of the brackets is 9 inches, and the projection of the cap and crown moldings over the sides of the end brackets on each side is 12 inches.

As shown on the elevation, Flg. 1, the three center brackets are to set over the center of the brick piers, and the two end brackets are to set 12 inches from the line of the wall on each side.

from the line of the wall on each side.

To figure these divisions proceed as follows: Referring to Flg. 1, add the width of the end pier, 2 feet 6 inches, the width of the window opening, 3 feet, and one half of the second brick pier, which is t foot 6 inches, the total of which amounts to 7 feet. Now add the distance that the end bracket sets from the wall line, which is 12 inches, the width of the bracket, 9 inches, and one half width of the second bracket, which is 4½ inches, and amounts to 2

amounts to 9 inches; deduct the 9 inches from the 6 feet before obtained, and there remains 5 feet 3 inches, which is the length for the two divisions in the center of the cornice, as shown.

should come plumb over the outside line of the two brackets, as shown by the dotted lines in Fig. 1. Now, by adding the widths of the three center brackets, which amount to 2 feet 3 inches, and the two center divisions. which amount to 10 feet 6 inches, we will have 12 feet 9 inches, which gives the length of the pediment from intersection to intersection, shown by the dotted lines in Fig. 1. For the length of the two end crown moldings add the end space, 4 feet 10½ inches, the width of the bracket, 9 inches, and the space of 12 inches, the total of which amounts to 6 feet  $7\frac{1}{2}$  inches, as shown.

Now, if these lengths have been correctly figured the amount should be 26 feet. The panels are usually given 3 inches margin from the side of the brackets; then is each panel 6 inches shorter than the spaces shown between the brackets; the modillions are easily spaced after the brackets are in position. To illustrate the use of the pediment chart shown in Fig. 3, let us suppose that Fig. 1 is an architect's drawing, from which we shall draw our full size detail, omitting the full size detail of the pediment and using instead the pediment chart, which is drawn to one-third full size, the chart being drawn full size in practice.

size detail, omitting the full size detail of the pediment and using instead the pediment chart, which is drawn to one-third full size, the chart being drawn full size in practice.

First obtain the bevel of the pediment shown in Fig. 1, as shown by A in Fig. 2, and make the base or horizontal line J L in Fig. 2 12 inches; draw the bevel or slant line J I indefinitely until it intersects the perpendicular line I L, drawn at right angles to J L, as shown. The diagram in Fig. 2 is drawn to a scale of \(\frac{1}{2}\) inch to the foot, and shows the hight of the penpendicular line I L to be 5 inches, or in other

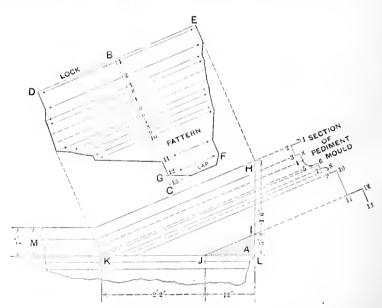

Fig. 2.-Enlarged View of Part of Pediment.

If these divisions are figured correctly, the total should amount to 26 fect. Now, to obtain the lengths of the pedlment and crown moldings, proceed as follows: Referring to Fig 2, note the intersection K. This intersection K

words, that the one-half pediment shown in Fig. 1 has a rise of 5 inches to every 12 inches of base. Fig. 3 represents the pediment chart and is an enlarged view of the triangle A in Fig. 2, and shows how the base line J L in Fig.

2 should be divided into quarters, halves and inches. In practice it is not necessary to draw an extra chart, as shown in Fig. 3, but make the divisions of inches direct upon the chart, as indicated by A in Fig. 2. The bevel I J L in Fig. 2 being correct, the pattern for the pediment is obtained direct from this bevel in the usual manner, as shown in Fig. 2, and needs no further explanation. In this case the hight of the miter cut H I in Fig. 2 will be 1 foot 6 inches, and the length of the miter cut on the horizontal line K J will be 2

the miter cut II I in Fig. 2 is 1 foot 6 inches, the total of which amounts to 3 feet 3 inches; deduct the 7 inches, being the amount of the molding M in Fig. 2, and we have 2 feet 8 inches as required for the entire hight of the pediment as shown in Fig. 1. By sav-

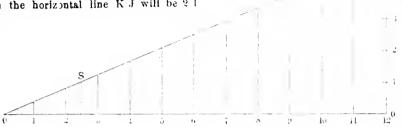

Fig. 3.-Pediment Chart.

feet 2 inches. Having obtained these measurements in practice, we are now ready to figure out the backgrounds and pediment moldings of any length pediment having the same rake and profile without making any further details, but simply using the chart shown in Fig. 3 and the pattern shown in Fig. 2. The chart, as before explained, should be at A in Fig. 2. Thus, to obtain the sizes of background and moldings for the pediment shown in Fig. 1, with but 12 inches of detail, proceed as follows: The length of the pediment in Fig. 1 from intersection to intersection is 12 feet 9 inches; the miter cut on the horizontal line from intersection K to J in Fig. 2 is 2 feet 2 inches; twice 2 feet 2 inches is 4 feet 4 inches. Deducting 4 feet 4 inches from 12 feet 9 inches leaves 8 feet 5 inches. One-half of 8 feet 5 inches equals 4 feet 2\frac{1}{2} inches, as shown in Fig. 4, and gives the length of one-half of the base of background. The rise of one-half of the pediment is 5 inches to the foot, as shown on the chart in Fig. 3. If 1 foot rises 5 inches, 4 feet will rise 20 inches, and 2\frac{1}{2} inches will rise as much as is shown in Fig. 3 where the dotted line intersects the hypotenuse at S, which is 1\frac{1}{2}\frac{1}{4} inches (in practice the \frac{1}{2}\frac{1}{4} inches (in

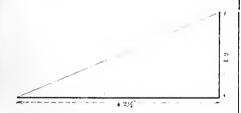

Fig. 4.-One-Half of Melal Background.

the base, as shown in Fig. 4. Then will Fig. 4 represent one half of the background of a pediment having the length and bevel shown in Fig. 1. For the length and miter cuts of the pediment moidings use the pattern shown in Fig. 2, and measuring on the line G F make G F in length equal to the slant line or hypotenuse of the background shown in Fig 4, making similar miter cuts at each end of the moiding, as shown on pattern in Fig. 2.

The hight of the background in Fig. 4 is 1 foot 9 inches, and the hight of

ing for future use the pattern and chart, any length pediment can be quickly laid out; and if a different design of cornice is used, the same pediment can be employed. By using the same rake, the bevel on the ornaments shown in Fig. 1 need not be changed. For example, if the length of the pediment was 16 feet 4 inches, instead of 12 feet 9 inches, as shown in Fig. 1, we would deduct

in Fig. 3, we recently made a cornice similar to Fig. 1, having a pediment 22 feet 4 inches in length, and having a rise of 4½ inches to the foot. To draw to full size one-half of this length pediment, so as to get the correct dimensions of the background, it would have required 11 feet 2 inches of space or drawing paper; whereas as shown in Fig. 3 a triangle only was required 12 inches in length, having the correct bevel, from which the pattern, base and rise of the pediment background was obtained as before explained, and from the hypotenuse or slant line of the background the length of the pediment molding was obtained.

#### FLASHINGS.

THE SYKES STERL ROOFING COMPANY, 611 South Morgan street, Chicago, have secured the contract for furnishing curved corrugated sheets to be used in fire proofing the new warehouse of Felix & Marston, now being erected in that city. The building is erected with 8-inch steel beams to support the floors, placed 42 inches apart. Curved corrugated sheets are sprung across these spaces, their ends resting on the lower flanges of the beams. The curve of the sheets is 9 inches deep. A depth of 5 inches of concrete is to be spread over the tops of the sheets and beams to form the floor. The roof will be formed in the same manner. The magnitude of the building can be esti-

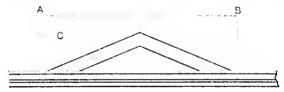

Fig. 5.—Pediment on a Horizontal Molding.

twice the length of K J in Fig. 2, which is 4 feet 4 inches, from 16 feet 4 inches, which leaves 12 feet or the base length of the background. One half of 12 feet equals 6 feet; 1 foot rising 5 inches, 6 feet would rise 30 inches, or 22 feet 6 inches, or the center hight of the background. The length of the moldings would be obtained from the hypotenuse or slant line of the background, using the pattern and mitter cuts shown in Fig. 2, measuring on the line G F for the length of the moldings. After once having the chart and patterns the measurements are quickly obtained.

It may be required to know what the hight of a pediment of this length would be above the top of the crown molding of a cornice. This is very simple. The center of the background rises 2 feet 6 inches, as before explained, and the miter cut H I in Fig. 2 is 1 foot 6 inches, making the total hight 4 feet; deduct the 7 inches, being the hight of the molding M in Fig. 2, which leaves the hight of the pediment 3 feet 5 inches from the top of the crown molding to the apex. In Fig. 1 a pediment is shown which intersects with the horizontal crown molding, while in Fig. 5 is shown a pediment entirely above a horizontal molding. The chart shown in Fig. 3 is applicable for both forms of pediment, it only being necessary to know the length of A B in Fig. 5, and from this length to deduct twice the width of the miter cut C on the horizontal molding, following the rules as before explained.

To illustrate the time and labor saved by using the pediment chart, as shown mated from the fact that 3 tons of sheets will be required to fill the order. The building will be absolutely fire proof, containing no wood work whatever.

IN A HANDSOME souvenir edition of the Mountjoy (Pa.) Herald recently issued, among other prominent business men of the town, H. K. Nissley, roofing contractor, is mentioned in a two-column article. Illustrations are also given of his punching and cutting machine for roofing slate, by which, it is claimed, many kinds of work can be done ten times faster than by hand and much more efficiently.

C. W. CLARK & SON, New Haven, Conn., have secured the contract for putting the slate roof on the new round house of the Consolidated road, or more properly speaking, the New York, New Haven & Hartford Railroad.

Efforts are being made to enlist public sympathy in support of the proposed ship causi from the Georgian Bay, an arm of Lake Huron, to Lake Oatario. Last week several gentlemen from Toronto delivered addresses at Chicago before members of the Chicago Board of Trade, the Produce Exchange and the Lumbermen's Association, setting forth the advantages accruing to lake commerce from the construction of this canal, which would shorten by 300 miles the water route between Chicago and Toronto. The proposed canal is to be constructed for vessels drawing 20 feet, and is estimated to cost \$40,000,000. It would avoid the long route through the St. Clair and Detroit rivers, Lake Erie and the Welland Canal.

# PLUMBING and GAS FITTING.

# Gas and Gas Fitting.—

BY J. W. HUGHES.

#### Economical Gas Burning.

In concluding the series of articles on gas fitting, it will be in order to give gas htting, it will be in order to give a few general hints on the principles governing the burning of gas for illuminating purposes, in order to obtain the greatest amount of light with the smallest possible consumption. There are six general principles covering this important part of the question that should be thoroughly understood by

the gas fitter:

1. The pressure at which gas is burned (delivered at the burner).

2. The sizes of pipes and their freedom from obstruction.

3. The sort of burner used in order to obtain the best resulte.

4. The kind of globe or shade used.

The temperature of the gas. The presence of air in the gas.
